accession 21858

United States Circuit Court,

SOUTHERN DISTRICT OF NEW YORK.

AMERICAN BELL TELEPHONE COMPANY ET AL.

v.

THE PEOPLE'S TELEPHONE COMPANY ET AL.

ARGUMENT OF J. J. STORROW, Esq.,

FOR COMPLAINANTS.

BOSTON:
ALFRED MUDGE & SON, LAW PRINTERS, 24 FRANKLIN STREET.
1884.

#44328
Rec'd
7/28/27

CONTENTS OF MR. STORROW'S ARGUMENT.

The record and the papers 1

THE PATENTS SUED ON:

Alexander Graham Bell's speaking telephone patent, March 7, 1876, No. 174,465.

Improvements on do., Jan. 30, 1877, No. 186,787 4

The telephone: how and why it talks 5

Nature of the air vibrations which constitute articulate speech 5

Meaning of the phrase "form of vibration" 10

Manner in which the telephone produces articulating vibrations at a distance 12

Mr. Bell's *method and apparatus;* the description thereof in the patent and the claim thereon 18

Judicial construction of that patent by the Commissioner of Patents, by Judge Lowell and by Mr. Justice Gray 20

The microphone form of speaking telephone transmitter 25

The Blake form of microphone or "Blake transmitter" 28

Minuteness and delicacy of the forces and motions by which the speaking telephone is actuated and which it must perform 30

Professor Pierce's sound curves drawn by the voice 31

ALEXANDER GRAHAM BELL:

His history and how he made his invention 33

His correspondence before his patent; interview with Professor Henry, 36

THE DRAWBAUGH CASE:

The advent of Drawbaugh:

His newspaper proclamation 39

This suit brought and preliminary injunction granted 40

The Drawbaugh story as told in the answer 41

Its most material allegations are confessedly false; no use was ever made of the alleged apparatus at any time except for the purpose of experiment and to gratify curiosity in the claimant's workshop 43

The apparatuses produced and alleged to antedate Mr. Bell's invention are mere wrecks 44

The origin of this claim — *the quartette* 45

Drawbaugh's pretensions acquired for nothing and immediately expanded into a capital of $5,000,000 46

To Alexander Graham Bell the world owes the art of transmitting speech and every speaking telephone that exists 46

For the benefit he conferred he received a patent. Relying on that patent, he and his associates had expended their money and created an enormous property 47

Drawbaugh admits that he never taught the community anything, nor furnished them with any speaking telephones, nor did anything to benefit the world; but insists that he has found a flaw in Mr. Bell's title which requires the Court to give him the property Mr. Bell earned and paid for 48

Such claims against such patents have often been presented, but have never been believed 49

Rules of proof established by the courts 49

The probative effect of conduct is all that is fit to be relied upon 50

The admitted facts of Drawbaugh's history disprove the existence of a speaking telephone in his hands 51

Attempts at explanation — *poverty and want of tools* 51

The allegations made, if true, would not explain the situation; in fact, the man had ample tools and abundant resources 52

His advertising card and other advertisements 53

Description of the exhibits produced by Drawbaugh — wrecks and remains 56

The operative parts rest on Drawbaugh's memory alone 61

The microphones alleged to have been made immediately after the date of the Bell patent — *high-water mark* 65

Value of these exhibits as proof:

Drawbaugh was a skilled and fastidious workman; use of the rude instruments **F**, **B**, etc., at any period absolutely disproves the existence of anything better at that time 72

Use of these rude instruments during any considerable period proves that they did not give results enough even to encourage him to spend a day in making anything better 73

Proof from the defendants' record that **F** and **B** were superseded and destroyed as soon as the next pair were made. Their use at any period, therefore, shows that at that time the next pair did not exist 76

The sworn answer alleged that instruments made before the close of 1874 are now in existence, capable of successful practical use. This is absolutely false, and was known so to be to the defendants when they filed that answer 77

Half the testimony in the defendants' record, if believed, proves that the tumbler **F** and tin can **B** were admirable practical operative instruments. Nine tenths of it proves if believed that telephone sets made out of the instruments **F**, **B**, **C**, **I**, **A** were perfectly practical and commercially useful instruments 78

The fact is that recent tests made by the defendants show that the originals of which these exhibits are remains never could have transmitted two consecutive words, even if the parts not now existing were what Drawbaugh supplies out of his own memory or subsequently acquired knowledge 78

Tests of the Drawbaugh exhibits in New York 81

These tests were made with new instruments constructed by Drawbaugh for this case, containing the results of six years' experience after the Bell patent 81

They contained essentially operative parts, which the remains show could not have been in the alleged originals.... .... 81, 100

They were tried by skilled experts, and under conditions much more favorable than ever existed at Drawbaugh's shop 81

Description of the so-called reproductions of the tumbler and tin can, 82

Results obtained from them 89

"**F** reproduced" and **A**; results obtained 91

"**C** reproduced" and "**I** reproduced" 92

If Drawbaugh had before the date of the Bell patent instruments giving the same results as were obtained from these in the New York tests, they would not destroy this patent 92, 100

But the tests destroy the defendants' witnesses 94

Difference between the alleged originals and the miscalled reproductions 93

History of Drawbaugh; there is no room in it for the speaking telephone. It is not the history of the inventor of the speaking telephone 96

The *advertising cards* of 1874-5-6 give a list of his inventions, but no telephone in them 96

Holsinger, friend of Drawbaugh, and a newspaper writer, published about his inventions, but not about the telephone 97

The *Baltimore American* in 1878 published that Drawbaugh had tried to transmit sound, but had never transmitted speech and never expected to 98

Difference between the tin can **B**, and the so-called "**B** reproduced". 100

The Reis telephone:

It is a circuit-breaker and not a speaking telephone; its character and mode of operation 101

The *Baltimore American* article and its importance 107

Mechanicsburg newspaper articles of 1878. Proof that Drawbaugh was then known to his intimate friends as one who was then trying to improve Mr. Bell's telephone, but who did not originate the mother invention 108

Similar proof from the Lloyd and Worley article in the *Harrisburg newspapers*, February, 1878 111

Drawbaugh visits the *telephone office* in May, 1878; statement that he is trying to improve the telephone; exhibits one of his instruments; examines theirs; borrows one and takes it home to study, but does not intimate that he originated the invention .. 113

Mr. Stees and his telegraph line 114

History of Cumberland County and Drawbaugh's *autobiography;* they prove from Drawbaugh's mouth that his work was then (1878) trying to improve the telephone which another had originated .. 116

Similar statements to *Theodore Grissinger* in April, 1878 119

Similar statements to *Theophilus Weaver*, May, 1878 119

He stated to them that he could not antedate Mr. Bell, not because he did not *then* claim that he had made experiments on the transmission of *sound* early enough, but because his experiments did not reach *speech*, were total failures and abandoned as such 121

Dr. Moffitt, and the defendant, *E. W. Chellis:*

Dr. Moffitt had known of all Drawbaugh's inventions for ten years. In the fall of 1878 he and Chellis declined to join Drawbaugh in patenting the telephone improvements, because they knew he could not antedate Bell, who held the bottom patent 122

Drawbaugh agreed to this 124

The faucet interference testimony:

In the summer of 1879, in controversy with David Hauck, a former shopmate, Drawbaugh undertook to have Hauck enumerate and then to enumerate himself the contrivances he had made which might tend to show that he was an original inventor and an originator, rather than a mere improver. He and his witnesses named many contrivances to sustain this issue, but never mentioned the telephone 124

He does not now offer any explanation why he should not have then mentioned it if he ever invented it 129

Every piece of writing relating to Drawbaugh in the world specifically and absolutely disproves the claim now made: summary of them 130

Drawbaugh's history for the ten years before the date of our patent:

Alleged date of conception 1863–4 131

Alleged date of first instrument, 1864–5 131

The defendants' record shows that Drawbaugh and all his neighbors believed that a speaking telephone would be very valuable if it could be made 132

Drawbaugh's various enterprises from the date of his conception:

Nail machine and partners in that, among whom was Gov. Geary; no telephone offered to them 134

The Faucet Company 135

He was able to obtain partners and plenty of means for other inventions. The *Faucet Company* bought his faucet and pump patents in 1867, fitted up a machine shop for his use and invested $25,000 in the business 137

They then asked for other inventions; he offered many, but no telephone was ever mentioned 137

This company had nine partners, and lasted from the spring of 1867 until the summer of 1873: no partner ever heard of a telephone 140

It had eighteen workmen: no workman, while he was employed there, ever heard of a telephone; Carns, Smith, Hoffman, Schrader 142

Attempt to introduce *ex parte* evidence: Dr. Musser 145

Meeting of the prominent members of this company with Drawbaugh's counsel to consider whether they could help him in this case... 146

Admission that they knew nothing about a telephone and could say nothing to aid him 147

Hauck Bros. & Co. and the interference testimony 148

The Axle Company existed from the beginning of 1875 to the fall of 1876; the members thereof called by the defendants prove that no practical speaking telephone existed during that period; and that no instruments existed better than the tin can B 148

That the partners and other neighbors who contributed $30,000 for his shop and his patents after the alleged invention of the telephone, and the twenty workmen who were employed there during that period, knew nothing of any speaking telephone, is absolute proof against this claim.................................. 149

Friends of Drawbaugh, who from their position and standing would certainly have known of the telephone if any had existed, and would have given aid if they had known of it, are called as witnesses and disprove its existence......................

Andrew R. Kiefer, superintendent of telegraphs, Pennsylvania Railroad 151

Simon Cameron Wilson, superintendent of telegraphs, Northern Central Railroad... 152

The Magneto Key: Drawbaugh's exhibitions and trials of it disprove the existence of the telephone......................... 152

Theophilus Weaver.. 154

It is alleged that he worked upon and thought of nothing except the telephone... 155

In fact, he employed upon other electrical experiments on other subjects twenty times as much time, labor and money as he ever devoted to telephones.................................... 155

History, occupations and list of things other than telephones which he made.. 155

His ample supply of tools and facilities.......................... 158

Witnesses who saw the other electrical contrivances now think that they knew of nothing but the telephone.................... 198

Drawbaugh's finances; his means were ample; his cash receipts...... 155

His attempts to account for the disposition of money which he admits he had are a tissue of falsehoods.......................... 160

The defendants' proofs judged by themselves; they are so inconsistent with each other upon the substantial and material points as to destroy their whole value........................... 164

Illusions of memory.. 166

Value of the different classes of witnesses...................... 166

Examination of some sample witnesses from the defendants' record.. 167

J. J. Zacharias... 167

Samuel Nichols.. 168

H. K. Drawbaugh... 170

Mrs. Mary Darr.. 171

George W. Drawbaugh... 172

Joseph Ditlow.. 173
Henry Bayler... 174
E. R. Holsinger.. 177
Dr. Moffitt.. 178
W. H. Zearing.. 179
Jesse Eicholtz... 180
String telephones in Drawbaugh's shop, and in his brother's shop —
Jesse Eicholtz... 181
David M. Ditlow.. 182
Herman J. Eppler....................................... 182
Sample witnesses continued:
H. B. Musser... 183
W. H. Decker... 184
Urias R. Nichols....................................... 185
C. E. Updegraff.. 187
A. B. Fisher... 189
S. B. Heiges... 192
Drawbaugh's invention, that is, the construction of his instrument and its mode of operation, never disclosed to the public, and not proved by any witnesses.. 197
Defendants' sample witnesses continued:
Wilson N. Miller....................................... 199
David Stevenson.. 201
William B. Stone....................................... 202
Peter C. Zimmerman..................................... 204
Henry F. Drawbaugh..................................... 205
John B. Drawbaugh...................................... 208
W. N. Kline (the deaf man)............................. 210
Mrs. Drawbaugh's complaints of Daniel's experiments began in 1876, not before... 212
The magneto key and call bells and a description of them............ 213
Jacob E. Shettel....................................... 214
He mistakes **H** for the magneto hotel alarm.......... 215
His testimony disproves Drawbaugh's poverty............ 216
Drawbaugh never had a judgment levied on his property.. 217
Defendants' sample witnesses continued:
Cyrus Orris.. 218
Testimony "to the best of my knowledge, I could not just think of it at that time."................................ 219
John C. Smith.. 219

David H. Good.. 220
The neighbors ready to swallow any story about Drawbaugh........ 220
Drawbaugh says that he has no record evidence; that he offers none is sufficient to disprove his story............................ 221
In fact, he has some, and has suppressed it........................ 222
Defendants' witnesses continued:
Augustus Kahney.. 223
Orlando Kahney and Joseph and Abraham Ditlow.............. 224
Orlando Kahney solicits a bribe and fails to get it.............. 228
Instruments **D** and **E**:
Character of these instruments. They are the first that will talk; whenever produced they must have created a great impression, and there should be no difficulty whatever in producing plenty of witnesses who talked through them........... 229
High-water mark reached in the summer of 1876, and no improvements invented afterwards...................................... 230
Drawbaugh says that **D** and **E** were used by a great many persons.... 234
But, in fact, out of three hundred and thirty-six witnesses they can only find eight who pretend to have known of any use of them before the Bell patent.................................... 235
The Drawbaugh family cannot prove the existence of **D** and **E** before the Bell patent.. 235
List of witnesses who pretend to speech though **D** and **E** before the date of the Bell patent:
W. H. Decker heard through them the year before the defendants say they were made...................................... 236
Jeremiah Fry did not talk but sang.............................. 236
Isaac B Millard.. 237
Daniel Fettrow, living in Drawbaugh's house, never saw any telephone and never has been spoken to about one until eight years after the defendants say they were known to the whole community.. 237
The curled magnets.. 239
Fettrow's accounts prove that the magnets for these instruments were not made before April, 1876.................................. 240
E. R. Holsinger.. 241
The proof to support **D** and **E** is absurdly below what would have been produced if they had existed before Bell's patent........ 242
The New York tests proved that the case must turn on **D** and **E**. The defendants spent two years and called two hundred and thirty-

eight witnesses with knowledge of that necessity, but could only find two men who ventured to say that they had heard speech through **D** and **E** before Bell's patent, and the testimony of both of these men is conclusively proved to be false: they are, 242
John Simmons.. 242
George A. May.. 244
This condition of facts is conclusive against them.................... 246
Certain witnesses pretend that they *saw* **D** and **E** before the Bell patent and talked about them, but did not talk through them. Such testimony is absurdly false on its face.............................. 246
These witnesses are:
R. K. Shireman.. 247
Daniel Rupp.. 248
Jacob B. Fry.. 249
C. E. Updegraff.. 249
Daniel Balsley.. 249
Daniel B. Condry.. 250
Jacob E. Shettel.. 250
John H. Stephens.. 251
J. M. Wisler.. 251
George L. Hale.. 252
Vanasdale and Ensminger.. 252
W. H. Bates.. 252
The Axle Company covered the period from the beginning of 1875 till the fall of 1877. The fact is that during that time Bell's patent came out and his telephone attracted the attention of the world, including Drawbaugh. The defendants' allegation is that during that time Drawbaugh made his first practical machine, and also completed his most perfect microphones. If the story be true, every member of the Axle Company would prove it beyond question. In fact, they conclusively disprove it............. 254
Capt. Moore.. 256
Wilson Bear.. 256
Michael M. Grove.. 256
Jacob Kline.. 256
The defendants' allegation is positively disproved by the defendants' witnesses.. 257
Drawbaugh is unwilling to assert that **D** and **E** were made before the Bell patent, and by his silence under the circumstances of this case admits that they were not.............................. 259

He is unwilling to contradict Springer ... 261

He asserts now that he does not know when they were made; in 1878 and 1879 he did know, and then asserted in substance that they were not made before the Bell patent ... 261

Upon this proof, the Court, as a matter of law, cannot find anything that Drawbaugh is not willing to swear to. ... 262

Complainants' witnesses who positively prove that the tin can **B** was the best that existed in 1876:
- R. E. Shapley ... 262
- I. D. Landis ... 263
- H. S. Rupp and others ... 263

The tin can **B** doubtless copied from an imperfect description of Bell's instrument in the *Scientific American* of Sept. 9, 1876 ... 264

Dr. Van der Weyde's description of the Reis telephone shown to Drawbaugh in October, 1876, and **B** then changed over into a Reis transmitter ... 265

The electric speaking telephone realizes a mathematical conception; Mr. Bell had that conception and was enabled to realize it; Drawbaugh never had it ... 267

Drawbaugh's story is that he did not have the knowledge necessary to make a telephone and that he never used one; there can be no higher proof that he never had one ... 268

Mr. Bell's second patent 184,465, of Jan. 30, 1875, for improvements in telephonic apparatus. When the Court finds that the Drawbaugh story is substantially false, the attack on the second patent will fall with the attack on the first ... 268

United States Circuit Court,

SOUTHERN DISTRICT OF NEW YORK.

IN EQUITY.

AMERICAN BELL TELEPHONE COMPANY ET AL.
v.
PEOPLE'S TELEPHONE COMPANY ET AL.

BEFORE HON. WILLIAM J. WALLACE, *Circuit Judge.*

ARGUMENT OF J. J. STORROW, ESQ.

NEW YORK, Sept. 22, 1884.

May it please your Honor: The record in this case is on your Honor's table. It consists of several volumes, and perhaps I had better state what they are, so that you can find your way through them.

The bill was sworn to Oct. 9, 1880, and filed Oct. 20, 1880.

The answer was filed on Jan. 6, 1881, and the complainants took their *prima facie* proofs soon after that time. They consist simply of the patents, proof of infringement, etc. They are bound in the first volume of *Complainants' Proofs.* The first one hundred pages of it comprise the complainants' *prima-facie* case. Then the defendants took testimony at or near Harrisburg, for the purpose of proving the history of Drawbaugh's alleged prior invention. That was their testimony as to the invention. That testimony is contained in two volumes, and, together with some expert testimony as to Mr. Bell's patent, makes their case in chief. The two volumes are marked, "Defendants' Proofs," Volumes I and II, comprising 1314 pages, and include 127 depositions, cited as *defts, i,* and *defts, ii.*

Then the complainants took their testimony in reply, chiefly relating to the Drawbaugh matter, but also somewhat relating to Mr. Bell's invention. That testimony is bound up in continuation of complainants' *prima-facie* case, making, with that, two volumes of 1741 pages, cited as *complts, i,* and *complts, ii.* The complainants' two volumes, I and II, contain their *prima-facie* case, and also contain their evidence in reply (the body of their proof in reply relating to Drawbaugh); and, between those two, there is sandwiched in the defendants' proofs in chief (*defts, i,* and *defts, ii*) in the two volumes before your Honor. After that proof was completed, then the defendants went on and took testimony in what is called their surrebuttal. It makes one thick volume of 1140 pages, including 199 depositions cited as *defts, iii.* Then the complainants took testimony in rejoinder. Your Honor will find the volume marked, "Complainants' Testimony in Rejoinder and Closing Proofs," cited as *complts, iii.* Fifty witnesses were examined in the complainants' rejoinder. On defendants' surrebuttal, there were two hundred and thirty-eight witnesses. Then the complainants' rejoinder, as we call it, comprising about fifty witnesses. After that was completed, the defendants began again, and took thirty-seven more depositions in what they called a surrejoinder; and you will find that testimony in their volume iv (*defts, iv*). After that was completed, the complainants examined eighteen witnesses, making what is called the *Closing Proofs,* which you will find bound in the same volumes with our rejoinder (*complts, iii*). After that, the defendants began again and took two depositions, which closed the case.

The complainants' proofs and testimony, therefore, consist, first, of Vols. I and II, which contain the *prima-facie* case, and the body of our reply on the Drawbaugh issue. Then a third volume (*complts, iii*), which contains our rejoinder and our closing proofs. Then there is a fourth volume, the thickest volume of all, containing the complainants' exhibits (cited *complts, iv, exhibits*).

The defendants' proofs consist of two volumes of 1340 pages, paged consecutively, and containing the body of their proofs in chief, namely, the testimony of one hundred and twenty-eight witnesses (*defts, i* and *ii*). Then comes the defendants' surrebuttal, containing 1140 pages, and comprising the testimony of one hundred and ninety-nine witnesses, cited as *defts, iii, surbtl.* Then a surrejoinder and closing proofs cited as *defts, iv.* They also have a volume of exhibits. They are bound up separately.

There are in these eight or nine octavo volumes 6446 printed pages. It was a matter of some embarrassment to know what kind of brief it was desirable to add to those volumes, in order not to override the Court with too much of a brief on the one hand, and on the other hand not to expect the Court to learn those volumes by heart, in order to understand their contents. We have followed what I may call a double-barrelled method. We have made two briefs, the first of thirty pages, containing substantially the essence of the case as we understand it. We have considered that it was the function of the oral argument to present to the Court our views of the cause in such a way that the Court might understand them. We thought that a proper supplement to the argument was a long brief, which should be divided up in such a way that by a table of contents and otherwise, the Court could refer to different parts of it, and where we could collect together, under different heads, not merely slight references to the general character of the argument which we thought that the facts warranted, but collect together references to the record, with very full quotations from the testimony, in order that the Court might thus have each particular point brought together in one book, in a convenient way, together with a reference or quotation of most of what each point needs to refer to, and an easy way of finding out the rest. We did not then think that we had done all that we ought, in order to facilitate the labors of the Court.

There were five hundred and thirty-five witnesses examined in this case. It would be impossible in any brief of reasonable length to bring in the testimony of all of them. We have, therefore, in addition to our brief, made an abstract of each one of these depositions. After an abstract of each deposition, and along with it, we have printed abstracts of certain other depositions, or of the parts of them which bore directly on the evidence of each particular witness. Of course, in considering the testimony of each particular witness, we have not undertaken to argue the case, and to show that the weight of the testimony was enough to overthrow it or otherwise; but we have brought together with the abstract of the deposition of each witness, extracts from others, which particularly or specifically bore upon him, as distinguished from other witnesses. We have done all this, not simply by stating what we understand to be the sum, substance, and effect of the witness's testimony, but wherever the language of the witness seemed to be in any way material, we have quoted it, to the end that the Court might have it all on the brief. We believe that three fourths of those witnesses are immaterial to the case, but that is a matter which the Court has to consider for itself. The volume which your Honor has in your hand is that abstract. Prefixed to it is an alphabetical list of the witnesses, so that when any witness is named, you can turn at once to that witness and find what particularly pertains to his testimony. We have thought it better to prepare this abstract with considerable fulness, knowing that what you do not want to read, you can omit, rather than give you insufficient means of information.

This case is a contest for the possession of the electric speaking telephone. It is a contest for the control, by patents, of the art of transmitting speech by electricity. Although the case does not turn upon any nice consideration of the question of infringement, or any nice consideration of what the precise apparatus is, nor its mode of operation, it is thought to be useful, at the outset, to state to your Honor somewhat at length, just what the speaking telephone is, what the invention that these parties are fighting for is, and how it transmits speech.

The COURT. Will you kindly give me the date of your application for the patent?

Mr. STORROW. Alexander Graham Bell's speaking telephone patent is dated March 7, 1876, No. 174,465. The application was filed Feb. 14, 1876. The patent was granted in the spring of the Centennial year, and the invention was exhibited at the Centennial, under circumstances which I will presently state. Perhaps I should say in this connection, that there are two patents. The principal one was issued on the date stated, and there is a second one, for improvements in the apparatus, dated Jan. 30, 1877, No. 186,787. That is also involved in this litigation. The application for that patent was made Jan. 15, 1877.

The defendants have no patent. They made an application, as the answer states and as the evidence shows, on July 22, 1880, but there has been no action, so far as appears in the record, by the Patent Office upon that application.

Now I come to a consideration of the question of what the telephone is, the title to which is in dispute before your Honor.

The telephone is a contrivance for transmitting speech by electricity. It does not transmit it in a way that a speaking tube does; it does not transmit it in a way that speech is transmitted through the air. When I speak, and somebody listens at a distant corner of the room, everybody within reach of my voice, between me and the listener, hears the same thing; but when I speak by telephone from here to the next town, the intervening persons hear nothing. It does not transmit in the way in which speech is transmitted mechanically across the room or through a speaking tube.

Everybody knows, for it is schoolboy learning, that sound is caused by vibrations of the air. It is transmitted by the propagation of those vibrations from one particle of air to the next. When a person speaks, his vocal organs agitate the air and set it in vibration; vibrating thus, they make the particles of air in contact with the vibrating vocal organs move in the same way. Each moving particle of air pushes and pulls the next, and that the next, and that the next, and so on, until they come to those particles that are next to the listener's ear, and they pull and push the drum of his ear, and thus excite in him the sensation of sound. The sensation of sound which he perceives and is conscious of is due to those vibrations; it therefore necessarily follows, and is the fact, that the kind of sound he hears, the kind of sensation which he experiences, depends upon the kind of vibration which produces the effect. One set of vibrations will produce one sensation, and another set of vibrations will produce another sensation; just as a peach, or a pear, or a glass of wine produces different sensations in the mouth.

Now, as everybody knows, the vibrations of the air particles, which produce the sound in the first place, take place in lines radiating from the source of sound, in lines between the source of sound and the listener's ear. These vibrations are, however, extremely minute, perhaps the five hundred-thousandth of an inch, perhaps less. It is also familiar knowledge that the length of the path which the air particles move over as they vibrate to and fro, or what is called the amplitude of the vibration, determines the violence of the sensation produced on the listener's ear; the more ample the vibration, the more powerful will be the sensation produced on the ear of the listener, that is, the louder will be the sound. It is also familiar knowledge that the time occupied in performing any one vibratory movement (which in the case of my voice is perhaps only the two-hundredth of a second) is what determines the pitch of the sound. If instead of moving and performing its vibration to or fro in the two-hundredth of a second, the air particle occupies the four-hundredth of a second, the sound will have a higher pitch; and so on in proportion. But that is not all. Everbody knows, experimentally, and from boyhood, that you may change the pitch of your voice, but the listener will understand what you say just as well, and will understand every word. If, for instance, I pronounce the word "yes," and then pronounce it again, with my voice raised to a higher pitch, you do not understand the word "no" the second time, but you understand "yes" as before. If I pronounce the word "yes" in a low tone, and again in a loud tone, the listener hears the same word, although he distinguishes that at one time it is spoken in a low tone, and the other time in a loud tone. If I am listening at a distant station, and hear the word "yes," as distinguished from the word "no," and recognize what it is, there is something different from loudness, something different from pitch, which determines to my ear which word is spoken. If I simply produce a sound of the same loudness, it may be another word. If I simply produce a sound of the same pitch, it may be another word. On the other hand, I may produce a sound which excites in the hearer the sensation of a particular word, and that sound may be a louder or a fainter sound, and may be of a higher or lower pitch. If I am to produce at the ear of the listener, at a distance, the sensation of the word "yes," I must do something besides controlling the loudness of the sound, and I must do something besides controlling the pitch of the sound he hears. What is it?

When the air particle is vibrating to and fro, between the speaker's vocal organs and the listener's ear, if I assume that at a given time it is to vibrate with a certain amplitude, that is, is to pass over a path of a certain length, then that amplitude will control the loudness of the sound at the ear of the listener. Now, assume that it is to do that in a certain period of time, say in the two-hundredth of a second; that length of time will control the pitch. Everybody knows that the amplitude of the vibration, that is, the loudness of a sound, may be varied without varying the pitch; or that the pitch may be varied without varying the loudness. But we know that neither change of pitch merely, nor change of loudness merely, will alter the word "yes" to the word "no." What then is it? It is perfectly easy to conceive that these air particles, in vibrating to and fro, each communicating its motion to the next, and that to the next, and so on until the disturbance reaches the listener's ear, may, although passing over a path of a definite length and in a definite period of time, perform the journey in different ways. The particle might start (if it had no inertia) at a full speed, and maintain a uniformity of speed to the end. Or it may start slowly and accelerate its speed, and then slow down as a pendulum does to the rate at which it started. It may move as the monkey of a pile-driver does, going in one direction uniformly, and in the other at accelerating speed. Or it may move at first fast, then slower, then faster again, and then slower. It may move as a trip-hammer does, and in various other ways. It is *the way in which the air particle performs its journey*, while passing from one end of its path to the other, that determines what the sensation of sound, at the listener's ear, shall be in respect to the distinction between words. When the air particle passes to and fro, over a path of a certain length, in a certain time, if it performs its journey in one way, it produces one sensation on the listener's ear. If it performs its journey in another way, it pulls and pushes a little differently on the listener's ear, and excites in him another and a different sensation, the sensation of a different word. This, which we may call the manner in which the air particle performs the vibration, or the mode of its vibration, irrespective of the length of the journey or of the time employed, constitutes what is called the "*form*" of its vibration. The way in which it performs its journey, irrespective of the length of the journey or of the time taken to pass over the whole, is the cause of what we call the "*quality*" of the sound. "*Quality*" of sound is the name applied to that which enables the ear to distinguish between one word and another word, if both words are spoken with the same loudness and in the same pitch. It is that which enables the ear to distinguish between a violin, and a flute, and the human voice, when they all sound a note of the same pitch and with the same loudness. If, therefore, I am to produce upon the ear of the listener at a distant station the sensation of the particular word "yes" instead of "no," it is not enough for me to produce a sound of a certain loudness; it is not enough for me to produce a sound of a certain pitch, but I must produce a sound of the right "*quality*" for the desired word. As I propose to do that in a telephone, not by bringing the listener within ear-shot of me, but by exciting at a distant station, by means of mechanism to be hereafter described, the air vibrations which are in turn to excite his ear, I must produce there, air vibrations which, not in amplitude merely (that is, loudness), nor in mere frequency, that is, in the time occupied by each total vibration (that is, in pitch), but which, in their *character and mode of vibration*, shall correspond with the particular word that I wish him to hear and understand.

Again, the Court can readily understand that if an air particle is performing its motion in a particular way, that motion may be compressed into a smaller compass of space, and still have its characteristic mode of travelling preserved. It may also be compressed into a shorter time or extended into a longer time, and still have its characteristic mode of travelling preserved. That, interpreted into sound, means simply that the same word and the same *quality* of sound may be preserved, although the voice may be louder or be higher pitched. In the same way, if a speaking telephone should produce a sound at a distance which had the requisite *quality* or character, it would be of very little consequence if it was not so loud, so long as it was loud enough to be heard. That is what takes place in every telephone. The sound at the receiving station is not so loud as the sound made at the transmitting station. Even if the pitch were changed, that would be immaterial, although, as matter of fact, in a telephone the pitch is preserved unchanged.

How is this to be done by mechanism?

When I speak to a person across the room, the listener at the distant station hears, because the vocal organs of the speaker, vibrating in a peculiar way, compel the air particle next to them to vibrate in a certain way; that in turn pushes or pulls the next, and the next pushes or pulls the next, and so on, until every intervening air particle is set into vibration. It is a mechanical propagation, as much (though not exactly in the same way) as if I took hold of a long stick, and pulled or pushed it against a person who had hold of the other end. Every particle of air between the speaker and the listener partakes of the same motion, and every person between the two hears the same sound. But with the telephone it is altogether different. By that I am seeking, not to propagate the sound vibrations between here and the next town, from my vocal organs to the ear of the person to whom I am speaking, in that way. It is done in such a way that the persons between us will hear nothing. There will be no agitation of the air between us, due to my voice. I am to produce a fresh and a new vibration at that point, which shall affect his ear, and which does not reach him by mechanically starting here and passing through the intervening mass of air. There is no mechanical motion between him and me. What I am to do is to have a contrivance at the distant station which shall there create fresh vibrations, which do not exist in the interval between us. The vibrations which I am to create there are not merely some vibrations, nor even those which will excite the sensation of sound of a proper pitch, nor those which would excite the sensation of sound with the proper loudness, but they must be of the right *character* of vibration in order to excite in him the sensation of the right *quality* of sound; and then he will understand. The problem which I have to perform, therefore, is to find a contrivance which will produce this effect. The way in which it is done is by vibrating a diaphragm at the receiving station; and the mechanical problem is to take that diaphragm at the distant station, and by some kind of contrivance lay hold of it, so that I can shake it at my will; not merely shake it, but shake it as I want to shake it. When I want a listener to hear the word "yes," I want to shake it in such a way as to produce the vibratory motions which belong to that word "yes"; and when I want him to hear "no," I want to be able to shake it in a different way, so as to correspond with the word "no." That is the problem. How are we to do it?

Before I pass from that, let me explain one phrase which is commonly used in this patent and in this argument. You will find when you come to the patent, and you will also find in the depositions on both sides, the phrase "*form* of vibration" frequently used. You sometimes, naturally, but still incorrectly hear the phrase "*form* of sound waves." When a painter says that he is going to paint the waves of the sea, and represent their form, we know what he means. When a physicist speaks of the "form" of sound waves, he does not mean what the painter does, or anything like it; he does not mean form which can be represented by a photograph, so to speak, of a visible thing (although there is a certain connection between the two, because one cause leads to both), but he means to express the result of a particular geometrical idea which, when I explain it to you, you will see is signified to the physicist by the term "form." Suppose, for example, that I have an air particle vibrating to and fro between the speaker and the listener, and can attach to that air particle, in some way, a pencil which will vibrate with it. When I speak one word, it vibrates in one way, in one manner and fashion; when I speak another word, it will vibrate in another manner and fashion. Now, suppose while it is vibrating, I put this paper under it and draw it along at right angles to the vibrating path. If it is vibrating in one way, it will make a wavy line on the paper. If vibrating a little differently, the wavy line will be a little different. Each particular motion, each peculiar vibration, and every variation of its motion in performing that vibration, produces a different line. Now, a person with an instructed mind, looking at that paper and observing the form of the curve which the vibrating particle of air drew when the word "yes" was pronounced, will observe that the *form* of the curve is different from that which the particle of air, with the pencil attached to it, drew when you pronounced the word "no." Therefore, I may properly and conveniently speak of the "*form*" of the vibration of the air particle, meaning thereby the form of the curve which it would draw if I fastened a pencil to it and drew the paper along under it. That is what we mean by the phrase "*form* of vibration." It has nothing to do with the contour of an actual wave. It simply comes from this convenient, graphic, geometrical way of representing the fashion in which that air particle waggles to and fro, now in one way and now another, and as it waggles in each different way it makes a different curve. I have here a little contrivance which I have used once before which shows that curve. Suppose the air particle be represented by this pencil moving to and fro in this slot; now I slide the paper along at right angles to the motion of the pencil, and the vibrating movement of the pencil makes a curved line. Each difference in vibration produces a difference in the line.

Suppose, now, that from a distance I want to produce that form of vibration. Suppose that piece of red wood in the slot be the air particle. I can pull it one way by a string, and the spring attached pulls it back; I can make it vibrate just as I may desire in that way. And if I have a little pencil there, fastened to that bit of red wood when it is vibrating, the pencil will mark on the paper the *form* of the vibration, — the paper being drawn steadily along during the vibration; in that way we shall have drawn on the paper a line at each vibration. If I can control the pencil *at every instant*, I shall control the way it vibrates. If at every instant I control the length of this string between the edge of the frame and the pencil, I shall control the successive positions and the whole movement of the pencil. Suppose I want to do that with my eyes shut; if I can train my hand sufficiently, the difference of force which I apply to the string from instant to instant will determine the way the particle vibrates. If I simply jerk it, the spring will pull it back and it will vibrate, but it will not vibrate the way I want it to. If I want it to be obedient to my will, I must keep hold of that string all the time, and by varying the force applied to that from instant to instant, I can control the way in which the particle vibrates. You can see very readily again, if you look at it on this paper, that the force applied to that string from instant to instant determines how the particle is to vibrate. That is the way in which the telephone is made to talk.

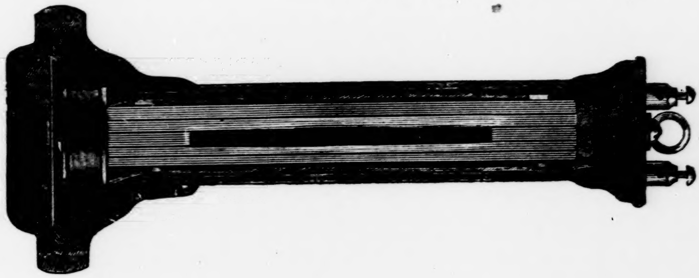
I have here a contrivance which is the gist of the speaking telephone. It is a part of the well-known commercial magneto instrument. It consists of a steel magnet, the end being prolonged into a little core, around which is wound a coil of fine copper wire insulated. That is quite a powerful permanent magnet, as your Honor will find. With that contrivance, if I place a piece of iron very close to the end of the magnet, where the coil is, and then pull it away quickly, I shall excite in the wire which forms the coil an electrical tendency to flow in one direction. If I bring the ends of that coil around and connect them, so that there is a path which the electricity can flow through, then there will be a current in that direction. That is, as I suppose your Honor already knows, the principle of what is generally known as the Dynamo machine. If I move this armature or piece of metal up to the core of the magnet, I shall also excite in the electricity a tendency to flow. If I move the piece of metal up to it, the tendency of the current, generated by the expenditure of the force of my fingers, is to flow in one direction. If I move the piece of metal away, the tendency is to flow in another direction. Now, it is not the *position* of the armature which makes the current. There is no more current when the armature is close to the magnet than there is when it is in the next room. It is the *motion* of the armature which makes the current. In other words, it is the expenditure of the force of my fingers which generates or is the cause of the electrical disturbance and flow. And, inasmuch as it is not the *position* of the armature but only the *motion* which generates the current, it necessarily follows that as long as you move this piece of metal within the magnetic reach, the current is flowing in that coil and the connected circuit. When I stop moving it, no matter where I stop, the current stops too.

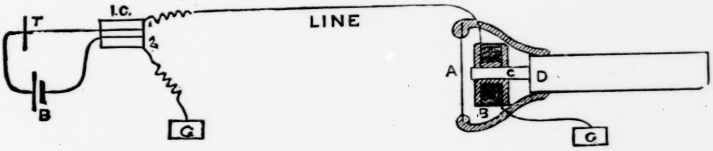
That is not all. That current, in its flow, is due to the motion of the armature. If I move the armature gently, the current is gentle; if I move it violently, the current becomes violent. Your Honor sees very well, therefore, that the currents which are produced in this contrivance have to correspond to the motion of this piece. So long as this moves, the current flows; if this moves violently, the current flows violently; if it moves gently, the current flows gently. You can therefore fairly say that all the currents represent, or are copies of, the motion of this. If now, instead of moving this by my finger, I use as armature a thin disk of sheet iron and speak to it, the vibrations produced in the air by my voice move that thin disk just as they would move the drum of the listener's ear and in quite the same way. This thin, elastic material can and will move in the same way if supported properly at the edges. Suppose now, that instead of using this thing which I hold in my hand and wave in front of the magnet, I place here this thin diaphragm, supporting its edges on a frame in front, and speak to it. Then it will move, and every motion of this disk which constitutes the armature (so prompt and so accurate is the performance of the apparatus), every motion of it to and fro, as it vibrates, generates a current in these coils which will correspond to the motion just as it did when I moved the heavy armature with my hand. The motions of the electricity in the coil, or, so to speak, the currents of electricity, will correspond to and will be the copies of the vibratory motions of this plate.

One more thing: if I speak to that, the motions of this plate are copies of the vibrations of the air particle. My voice moves one particle, and that moves the next one, and that moves the next one, and thus the same motion is communicated through them to the disk; it not merely makes it vibrate, but makes it vibrate in the same way, manner, and fashion, causing this to perform the same *form* of vibration. What is the consequence? Why, that the currents which the motion of this produces in obedience to itself, in this coil, are themselves the copies of the motions of that armature disk, which are the copies of the motion of that air particle; so that the currents may very properly be said to be copies of the very motions of the air particle agitated by my voice. If the agitation of the air particle is at any instant violent, the current becomes more violent; if the agitation of the air particle is less violent, the current at once weakens. Now it is true, not merely when I move the particles of air, not merely when I move the armature to and fro, that the currents arise, but if, while moving the armature from one extreme of its vibratory path to the other, I move it fast during the first part of the path, then the current at that instant is strong, and if I move it slow during the next portion of the same movement, the current is weak. Let it return part way on its path, and the current returns on its path. The changes of current, therefore, are copies of the motions of the armature, not merely in respect to the time during which the total motion takes place, not merely in respect to the mean violence of the movement of the armature during its total motion, but in respect to every change which can take place in the motion of the armatures while the motion from one extreme to the other is being performed. The currents, therefore, will not correspond merely in number to the vibrations of the armature (and the air particles which move it), but they still correspond in their *character* to what I have described as the *form* of the vibration which the armature and its actuating air particle perform.

Now, it is common enough to represent a varying current in the same way by a curve. Your Honor sees the Signal Service once a week represent the height of the barometer from day to day by a curve. In brokers' offices, the varying prices of cotton and of gold and stocks are represented by curves in the same way. So, in the same way, we can represent a variation of a current by a curve. There is no trouble in drawing a curve which shall represent now a strong current and now a weak one. As the current increases, the curve goes up; as the current falls down, the curve falls down. Now those changes in current correspond to the vibratory motion of the air particle moved by my voice, or, looking to the curve which represents the changes of current strength, we perceive that the curve which represents these current variations will be similar to the curve which represents the changing vibrations of the air particle. If the air particle moves in a particular fashion from one end to another, then the current will vary in that particular fashion, during the same time. If the air particle changes its manner of moving, and moves in a different fashion from one end to the other, then the current will vary in a different fashion. I shall then have currents which, in their changes, will be copies of the vibrations of the air, and may be correctly expressed in the manner I have stated, that is, represented by curves of similar forms. I might say that the electrical changes are all of the same *form* as the air vibrations which cause them.

What shall we do with those electrical changes or varying electrical currents when we have got them? At the distant station we will provide another apparatus of this kind. It is the same thing which I have already shown in illustration, except that now it is put in a case, and the diaphragm is mounted so as to be supported by its edges in front of the electro magnet. For convenience of illustration, I will add another figure in which T, I C and B represent a transmitter different from what I have described, and the other figure at the right represents the operative parts of a magneto telephone stripped of most of the case. A is the diaphragm, C the core, D the large permanent magnet, B the coil. Suppose now that diaphragm A to have a perfectly flat surface. I put it on the frame, and there is a pull now on it by the force of that magnet C. This pull holds it, bends it a little in the middle, and the diaphragm is no longer flat. The elasticity of the diaphragm prevents its being pulled in very far. Its position at any instant is determined by the relative strength of the two forces, the pull of the magnet in one direction tending to bend it, and the elasticity of the diaphragm tending to keep it flat. If the magnet pulls it harder, it will bend in further. If I increase the strength of that magnet in any way, it will pull it in further. If I diminish the strength of that magnet,





the elasticity of the diaphragm will act, and it will go back. Now just as in the apparatus with the string and spring which I showed before, by varying the strength of the pull (produced in that apparatus by my hand, and in this by the magnet), when we vary the strength of pull on the centre of this diaphragm, we pull it in or let it go back; if we increase the strength of the pull, it will pull it in; if we diminish the pull, the diaphragm will go out. By varying the strength of the pull which that magnet exerts on the centre of the diaphragm, I can move the latter and vibrate it, and not only vibrate it somewhat, or to some extent, but if I can control absolutely the pull which that magnet exercises upon the middle of this diaphragm, I shall control the way in which that vibrates just as I do in this string apparatus. If, therefore, I can *at every instant* control the strength of that magnet, or vary it according to my will, I can control the manner in which the disk vibrates, not merely as to the number of times it shall vibrate per minute, but I can control *the way in which it moves* while moving in a definite period of time, or in any period of time, from its extreme position in one direction to its extreme position in the other. How shall we do that?

If through the coils B of this electro-magnet of this receiving instrument, I pass a current of electricity in a certain direction, I shall increase the magnetism of the magnetic core C, and make it a stronger magnet. If I pass a current in the other direction, I shall partially neutralize the magnetism of this core, and it will become weaker. But that is not all. If I pass a strong current, I shall strongly increase it (or decrease it); a weak current will be less felt. I can control the magnetism of that core by passing a current through its coil. I can make the variations of magnetism in this core correspond to the current variations, because they obey and are in consonance with the variations in strength of the current passing through that. If I can control, absolutely and at every instant, the variations of the current passing through this coil, I can control, absolutely and at every instant, the variations of the strength of the magnet inside the coil, and therefore the force with which it pulls at the centre of that diaphragm. How may I do that? Let me take the currents which I have already generated by speaking to the other instrument at the other end of the line. Those are true electrical currents, capable of making a magnet, or, if already magnetic, of increasing or partially neutralizing its force. Now, if those currents, which in themselves are copies of those vibratory motions of the air particles which exist when I pronounce the word "yes," that is, vary in strength in accordance with those vibratory motions, are passed through this coil, then they will vary the strength of that magnet, just in accordance with the condition of the current. If these currents are, in the sense that I have stated, copies, in their increase and diminution of strength, of the vibratory motions of the air particles, they, in turn, in passing through the coil, will cause in the core C magnetic variations which are copies of themselves, varying the pull on the centre of that diaphragm in accordance with that varying magnetic strength. Then I shall arrive at this result: the pull on the centre of the diaphragm being the consequence of the magnetic variations, and a copy of them, and those magnetic variations being the consequence of, and therefore a copy of the electrical variations of the current which passes through this coil of the receiver, and they in turn, being copies of, because they are the consequence of those produced at the other end by the voice, I shall get on this diaphragm D a varying pull, which, not only in the period of its recurrence (so many times a second), but in every other particular, will be a copy of the vibrations of the air particle at the transmitting station.

Now, I have a contrivance in and by which every vibration of the air particle itself at the transmitting station will produce a corresponding change in the pull on the diaphragm of the receiver. All that I have to do then is to speak to this transmitter, and its diaphragm, being actuated by the voice, or rather by the mechanical action of the vibrating air performing a vibration which is that of the word spoken, produces electrical changes or undulations which are the same in *form*, and are true copies of the vibratory movements which exist at the transmitting end and which we want to produce at the receiving end to there act on the listener's ear; these electrical changes will in turn, by means of this contrivance, produce the same vibrations in the apparatus at the listener's station. You will observe that the essential thing is that the thing which links together the diathe elasticity of the diaphragm will act, and it will go back. Now just as in the apparatus with the string and spring which I showed before, by varying the strength of the pull (produced in that apparatus by my hand, and in this by the magnet), when we vary the strength of pull on the centre of this diaphragm, we pull it in or let it go back; if we increase the strength of the pull, it will pull it in; if we diminish the pull, the diaphragm will go out. By varying the strength of the pull which that magnet exerts on the centre of the diaphragm, I can move the latter and vibrate it, and not only vibrate it somewhat, or to some extent, but if I can control absolutely the pull which that magnet exercises upon the middle of this diaphragm, I shall control the way in which that vibrates just as I do in this string apparatus. If, therefore, I can *at every instant* control the strength of that magnet, or vary it according to my will, I can control the manner in which the disk vibrates, not merely as to the number of times it shall vibrate per minute, but I can control *the way in which it moves* while moving in a definite period of time, or in any period of time, from its extreme position in one direction to its extreme position in the other. How shall we do that?

If through the coils B of this electro-magnet of this receiving instrument, I pass a current of electricity in a certain direction, I shall increase the magnetism of the magnetic core C, and make it a stronger magnet. If I pass a current in the other direction, I shall partially neutralize the magnetism of this core, and it will become weaker. But that is not all. If I pass a strong current, I shall strongly increase it (or decrease it); a weak current will be less felt. I can control the magnetism of that core by passing a current through its coil. I can make the variations of magnetism in this core correspond to the current variations, because they obey and are in consonance with the variations in strength of the current passing through that. If I can control, absolutely and at every instant, the variations of the current passing through this coil, I can control, absolutely and at every instant, the variations of the strength of the magnet inside the coil, and therefore the force with which it pulls at the centre of that diaphragm. How may I do that? Let me take the currents which I have already generated by speaking to the other instrument at the other end of the line. Those are true electrical currents, capable of making a magnet, or, if already magnetic, of increasing or partially neutralizing its force. Now, if those currents, which in themselves are copies of those vibratory motions of the air particles which exist when I pronounce the word "yes," that is, vary in strength in accordance with those vibratory motions, are passed through this coil, then they will vary the strength of that magnet, just in accordance with the condition of the current. If these currents are, in the sense that I have stated, copies, in their increase and diminution of strength, of the vibratory motions of the air particles, they, in turn, in passing through the coil, will cause in the core C magnetic variations which are copies of themselves, varying the pull on the centre of that diaphragm in accordance with that varying magnetic strength. Then I shall arrive at this result: the pull on the centre of the diaphragm being the consequence of the magnetic variations, and a copy of them, and those magnetic variations being the consequence of, and therefore a copy of the electrical variations of the current which passes through this coil of the receiver, and they in turn, being copies of, because they are the consequence of those produced at the other end by the voice, I shall get on this diaphragm D a varying pull, which, not only in the period of its recurrence (so many times a second), but in every other particular, will be a copy of the vibrations of the air particle at the transmitting station.

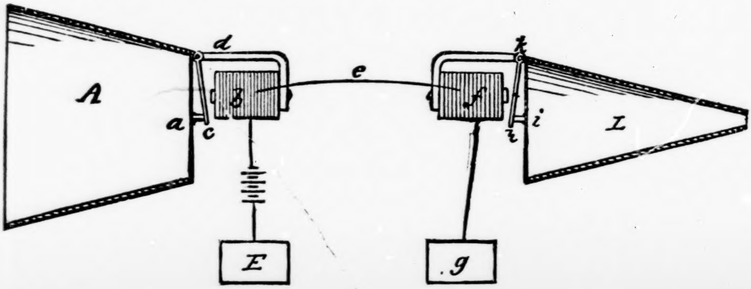
Now, I have a contrivance in and by which every vibration of the air particle itself at the transmitting station will produce a corresponding change in the pull on the diaphragm of the receiver. All that I have to do then is to speak to this transmitter, and its diaphragm, being actuated by the voice, or rather by the mechanical action of the vibrating air performing a vibration which is that of the word spoken, produces electrical changes or undulations which are the same in *form*, and are true copies of the vibratory movements which exist at the transmitting end and which we want to produce at the receiving end to there act on the listener's ear; these electrical changes will in turn, by means of this contrivance, produce the same vibrations in the apparatus at the listener's station. You will observe that the essential thing is that the thing which links together the diaphragm of the transmitter at the sending station and the diaphragm of the receiver at the receiving station, the essential thing which links those two together and makes the vibrations of the one to be a copy of the vibrations of the other in form, character, and quality, is the *peculiar kind of electrical variations* which traverse the line. If those are copies of what occurs here at the transmitting station, then the motions of the receiver due to them will be copies of what takes place at the transmitter; if they are not copies, then the motions resulting will not be copies. The gist of that apparatus is that the electrical undulations which traverse the line, due to the voice at the transmitting station, are the same in form as the vibrations of air which the voice makes at the transmitting station, and which we want to make at the receiving station. Having stated that, I will read the essential paragraph from the Bell patent (*complts*, *i*, 61): —

> "The armature *c*, Fig. 7, is fastened loosely by one extremity to the uncovered leg *d*, of the electro-magnet *b*, and its other extremity is attached to the centre of a stretched membrane *a*."

In that contrivance, instead of a plate of iron, Mr. Bell used a piece of bladder, or of membrane, or of parchment, stretched. As a membrane will not act upon a magnet, we must have a piece of magnetic metal, such as iron, fastened to it in some form, and have that piece of iron hung so that it will vibrate, and have the centre of the membrane fastened to that; and then the bladder and the attached iron are the equivalent of the disk of iron alone, which I have been using in my illustration.

> "The armature *c*, Fig. 7, is fastened loosely by one extremity to the uncovered leg *d* of the electro-magnet *b*, and its other extremity is attached to the centre of a stretched membrane *a*."

The Court. Which is the armature *c*?



Mr. Storrow. The armature *c* is this little piece of metal which comes down in a slanting direction in Fig. 7, at the bottom of the second page of the drawing. Across the end of that cone A, there is fastened a membrane. Then, hinged up at *d*, is a little piece of slanting metal *c*. That is the armature. That is hinged as you see it represented there, by one extremity to the leg *d*, and the other end is fastened to the centre of the stretched membrane.

> "A cone A, is used to converge sound vibrations upon the membrane. When a sound is uttered in the cone, the membrane *a* is set in vibration, the armature *c* is forced to partake of the motion, and thus electrical undulations are created upon the circuit E *b e f g*."
>
> "These undulations are *similar in form* to the air vibrations caused by the sound. That is, they are represented graphically by similar curves. The undulatory current, passing through the electro-magnet *f*, influences its armature *h*, to copy the motion of the armature *c*. A similar sound to that uttered into A is then heard to proceed from L."

The specification of the patent does not go through the long explanations which I have made, for those are matters which are familiar to everybody to whom this specification is addressed.

What then takes place is, that when the sound is uttered in the transmitter, the membrane is set in vibration, and the attached armature partakes of the same motion. This creates electrical changes. Those electrical undulations are "*similar in form*" to the vibratory motions which cause or constitute that sound. This undulatory current goes to the receiver. It influences its magnet to do what I have described and shown in this apparatus. The consequence is that "a similar sound to that uttered" into the instrument at the one station "is heard to proceed from" the receiving instrument at the other station.

That is the description of the speaking telephone, as given in the patent. Claim 5 based upon that description is: —

> "The method of, and apparatus for transmitting vocal or other sounds telegraphically, as herein described, by causing electrical undulations, *similar in form* to the vibrations of the air accompanying the said vocal or other sounds, substantially as set forth."

This is a claim which is a model, for this reason: In the first place, its avowed purpose is the transmission of vocal sounds. That, so far as public knowledge was concerned, was absolutely novel in the world. I am not now speaking of what the defendants may have proved to have been done by their man, but, so far as public knowledge went, it was an absolute novelty. Again, the way in which it is proposed to do it is by causing electrical undulations similar in form to air vibrations. When you have done that, you have attained the result of producing the vibrations by which speech is transmitted, and so far as I know the only way in which it can be done. If you have not done that, you have not transmitted speech. This claim, therefore, describes and puts its finger upon a result which is novel. That novel result is obtained by practising that mode of operation and not otherwise, and that mode of operation is novel. More than that, it is a claim for a method and for an apparatus. Whoever transmits speech by the method there pointed out, creating and utilizing electrical undulations similar in form to sound waves, infringes and copies that method. Whoever makes an apparatus (no matter what subordinate changes there may be), the main feature of which is that its mode of operation consists in the creation and utilization of that particular kind of electrical undulation, which is similar in form to sound waves, copies that apparatus. These are things that I have not got to discuss. In the first place, they are not seriously in controversy here. Both parties agree, I think, as to the scope of the patent which the first inventor of a telephone should have. The question between us is as to who is the first inventor.

Moreover, this patent has been elaborately construed at least three times, once by the Commissioner of Patents in a contested case, once by Judge Lowell in Spencer's case, and once by Judge Lowell and Mr. Justice Gray in Dolbear's case. In the latter case, the question turned on the construction of the patent, on the meaning of the patent, whether it was a broad patent, covering whoever transmitted speech by causing electrical undulations similar in form to sound waves, irrespective of the details of his mechanism. The mechanism in Dolbear's case differed more from the specific description in the patent than has ever been devised by anybody else; and yet the essential thing, the thing which made it talk, was the action of the voice at one end, creating electrical undulations, changes and disturbances similar in form to sound waves, and the contrivance at the other end which utilized those undulations to produce the vibrations which agitated the speaker's ear. See all these in brief, pp. 33, 69.

Judge Gray held in Dolbear's case (15 Fed. Rep. 448), that the patent covered, and rightfully covered, that kind of contrivance. He said (p. 451) : —

> After showing how two or more telegraphic signals or messages may be sent simultaneously over the same circuit without interfering with one another, he adds : " I desire here to remark that there are many other uses to which these instruments may be put, such as the simultaneous transmission of musical notes, differing in loudness as well as in pitch, and the telegraphic transmission of noises or sounds of any kind.
>
> " When the armature *c*, Fig. 5, is set in vibration, the armature *h* responds not only in pitch but in loudness. Thus, when *c* vibrates with little amplitude, a very soft musical note proceeds from *h* ; and when *c* vibrates forcibly, the amplitude of the vibration of *h* is considerably increased, and the resulting sound becomes louder."
>
> He proceeds to say : " One of the ways in which the armature *c*, Fig. 5, may be set in vibration has been stated above to be by wind. Another mode is shown in Fig. 7, whereby motion can be imparted to the armature by the human voice or by means of a musical instrument.
>
> " The armature *c*, Fig. 7, is fastened loosely by one extremity to the uncovered leg *d* of the electro-magnet *b*, and its other extremity is attached to the centre of a stretched membrane *a*. A cone, A, is used to converge sound-vibrations upon the membrane. When a sound is uttered in the cone, the membrane *a* is set in vibration, the armature *c* is forced to partake of the motion ; and thus electrical undulations are created upon the circuit E *b e f g*. These undulations are similar in form to the air-vibrations caused by the sound, that is, they are represented graphically by similar curves. The undulatory current passing through the electro-magnet *f* influences its armature *h* to copy the motion of the armature *c*. A similar sound to that uttered into A is then heard to proceed from L."
>
> The reference to Fig. 7 will be better understood by repeating, slightly amplified, Judge Lowell's explanation in *Spencer's case*. A cone of pasteboard or other suitable material, A, has a membrane *a*, stretched over its smaller end ; at a little distance is the armature *c*, consisting of a piece of iron magnetized by the coil of the electro-magnet *b*, through which is passing a current of electricity. When sounds are made at the mouth of the cone A, the membrane *a* vibrates like the drum of a human ear ; and the armature *c*, which is

directly in front of the magnet *b*, vibrates with this membrane, and its movements cause pulsations of electricity like those of the air which excited the membrane to pass over the wire *e*, which stretches to another similar magnet *f*, and cone L, with its membrane, and its armature *h*. The second armature and membrane take up the vibrations and make them audible by repeating them into the second cone L, which translates them into vibrations of the air. In practice, a metallic diaphragm or disk is often substituted for each membrane.

The inventor adds this explanation: "In this specification the three words 'oscillation,' 'vibration' and 'undulation' are used synonymously, and in contradistinction to the terms 'intermittent' and 'pulsatory.' By the term 'body capable of inductive action,' I mean a body which, when in motion, produces dynamical electricity. I include in the category of bodies capable of inductive action brass, copper and other metals as well as iron and steel."

His fifth and final claim is of "the method of and apparatus for transmitting vocal or other sounds telegraphically, as herein described, by causing electrical undulations, similar in form to the vibrations of the air accompanying the said vocal or other sounds, substantially as set forth."

In this claim, as throughout the specification, the word "method" is evidently used, not as synonymous with "mode" or "apparatus," but as equivalent to "process"; just as it was used by Chief Justice Taney, delivering the judgment of the majority of the Court, in *Morse* v. *O'Reilly*, 15 How. 62, 117, as well as by Mr. Justice Grier (who dissented in *Morse* v. *O'Reilly*) in delivering the unanimous judgment in *Corning* v. *Burden*, 15 How. 252-267. And the invention claimed is not merely the apparatus described, but also the general process or method, by which the wind, or a musical instrument, or the human voice, produces in a current of electricity a succession of electrical disturbances, not sudden and intermittent or pulsatory, but gradual, oscillatory, vibratory or undulatory, so as to give out at the farther end of the conducting wire sounds exactly corresponding in loudness, in pitch and in tone, character or quality, to the sounds committed to it at the nearer end.

The opinion in *Spencer's case* clearly points out that "Bell discovered a new art — that of transmitting speech by electricity — and has a right to hold the broadest claim for it which can be permitted in any case," and "the invention is nothing less than the transfer to a wire of electrical vibrations like those which a sound has produced in the air"; and that his patent, while not covering the abstract principle, without regard to means, of transmitting speech by electricity, yet is not limited to a particular form of apparatus, but includes the process or method (using the two words as equivalent), the essential elements of which are "the production of what the patent calls undulatory vibrations of electricity to correspond with those of the air, and transmitting them to a receiving instrument capable of echoing them."

The evidence in this case clearly shows that Bell discovered that articulate sounds could be transmitted by undulatory vibrations of electricity, and invented the art or process of transmitting such sounds by means of such vibrations. If that art or process is (as the witnesses called by the defendants say it is) the only way by which speech can be transmitted by electricity, that fact does not lessen the merit of his invention, or the protection which the law will give to it.

The mode or apparatus by which Bell effects his purpose is, by using an electro-magnet in the transmitter, and another electro-magnet in the receiver. But the essence of his invention consists not merely in the form of apparatus which he uses, but in the general process or method of which that apparatus is the embodiment.

Here is a model which conforms substantially to the drawing.

There is a little difference between the instrument which I showed to your Honor, and this model. In fact there are several differences. I showed the modern commercial telephone, which is a better instrument than any shown in the first patent. This is the improved instrument described and claimed in the second patent somewhat more improved in form. The improvements contained in it do not change the character or mode of operation; they make it do the same thing better. For example, in the original there is no permanent magnet. Here in this there is a permanent steel magnet. Let me say right here, that it is essential to the operation of this apparatus that there should be a magnet in it. You may have an armature which is magnetic, or you may have a core which is magnetic; but you must have the one or the other magnetic. Now you can make that piece of metal magnetic in two ways. You can take a soft iron core, which is neutral and has no magnetism, and put the coil around it in the circuit of a battery, which will produce a continuous flow of electricity; and that will magnetize it with this flow which the battery gives. But with a *constant* flow alone, no matter what its strength may be, you will not succeed in making a telephone talk. The *changes* in the current which produce changes in the magnetism of the receiver is what makes the telephone, and the action of the voice produces those changes in current. The introduction of a battery in the circuit enables us to dispense with the heavy steel magnet. I should rather say that the introduction of this heavy steel magnet enables us to dispense with the cost, annoyance and trouble of a battery. They have the same function, which is to give us a magnetic core. Now, the fact is that this little core is not a magnet itself, it is a piece of soft iron simply. It is therefore essential that it should be magnetized by some means. I can magnetize it by inserting a battery in that circuit so as to send a constant current through the coils around the core, which will make it magnetic, or I can do it by attaching to it a large and powerful magnet, the magnetism of which, flowing into the empty soft iron so to speak, makes it for the time being magnetic. If I take the soft iron core away, it will be no longer magnetic. It derives its magnetism by "induction," to use a convenient phrase. The magnetism of this large mass of steel, permanently magnetized to a high degree, flows into the core so to speak, and makes it magnetic for the time being. That is what the battery shown in Fig. 7 is for, to make this core magnetic. The first patent employed a battery to magnetize the core, and the second employed a permanent magnet for the same purpose.

Judge Gray's opinion gives a lawyer's statement of the patent. An excellent succinct scientific statement of it is given by Prof. Cross (complts, ii, 1707, ans. 3, quoted in brief, p. 62).

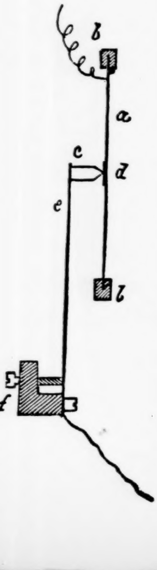
There is another form of contrivance by which the voice can produce these same electrical changes. The gist of this operation by which we transmit speech consists in the production of electrical changes which are *similar in form* to the air vibrations. If, instead of the transmitter which I have described, I can make a change in that instrument which will produce this same kind of variation in the current,—that is, variations which correspond to the vibrations of the air particle,—I shall not change the nature of the operation, or of the machine as a whole, or the method by which I transmit speech. I may make a contrivance which will be more efficient than that one, which shall do its work better, which shall be stronger or cheaper, or I may make a contrivance which will not do it so well. The contrivance which is commonly used commercially, because it is stronger in its effects, is a contrivance known as the microphone.

If I have a wire, through which a current of electricity is flowing, the electricity, to use the ordinary forms of speech, flows from one particle of that wire to the next, and so on through the wire. If I cut that wire into two parts, and separate them a foot, then the current does not pass, because there is no way for it to get from one to the other. If, now, I bring the two ends of the wire together again, the current will flow from this end of this wire of iron or copper, to the end of the other in contact with it; but it will not flow so well, because the union of particles is not so intimate when I simply place the ends of the wire together as it was in the uncut wire. But if I place them together so that they touch, the current flows. If I press them together harder, then the union of the particles will be more intimate, and the condition of things more closely approximate to that of the uncut wire, and the current will flow more easily. If I relax the pressure, it will not flow so easily. It is a law of electricity that the strength of the current, flowing in a circuit, depends upon two things: one is the electric force or energy which is poured into that circuit by the battery, or other source of power; and the other is the electrical resistance which it has got to overcome. For example, when you are using a garden hose, if you drive your force pump harder, you will get a stronger stream. If, without changing the pump, you tread on the hose, and are heavy enough, you will partly shut down the stream. It is the same way with electricity. If you can turn the throttle valve, if you can increase the resistance, you will diminish the current. This contrivance, therefore (cutting the wire, and then placing the two ends together), enables me to vary the current or the strength of the current supplied by the battery, without changing the battery. If I press the two ends together, there is less electrical resistance to overcome, and the current passes more freely. If I relax the pressure, although some current still passes, I may dwindle it down so that it becomes extremely feeble. Therefore, if I can make a contrivance of that kind, by means of which I can vary the pressure in *accordance with the vibrations of the sound waves*, I shall have a contrivance by means of which I can vary the current correspondingly.

In this apparatus which I have already described, wherein an armature is vibrated in front of an electro-magnet, the resistance of the circuit, the electrical resistance which the wire and apparatus offer to the flow of electricity, remains the same; but as I vibrate the armature more or less violently, I exert more or less electrical energy in the circuit. I put more power to my pump, and in that way vary the current, although my hose and pipes remain the same. If, on the other hand, I use a constant battery which does not change its force, and put, so to speak, a throttle valve in the path of the current, or some contrivance which interposes more or less resistance, I can equally well vary the strength of the current. This does not vary it merely at the point of contact, or at the point where I apply the throttle valve, but if I vary it in any one part of the circuit, I vary it equally all through the circuit. It so happens that the law is a simple one; that the strength of the current is according to the electrical energy at work in the circuit at the instant, divided by the resistance which it has to overcome.

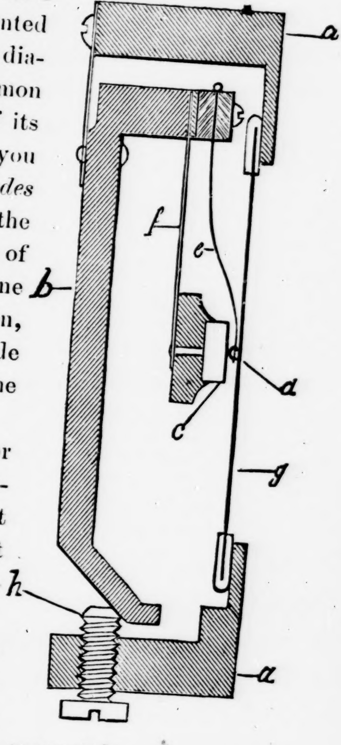
$$\text{Strength of current} = \frac{\text{electro-motive force}}{\text{resistance of the circuit,}} \text{ or } s = \frac{e}{r}.$$

If I double the resistance, I halve the current. If I halve the energy at work, I equally halve the current. I can therefore by a contrivance of this sort, if I can make it work practically, vary the current as I please. This is done by means of a contrivance which is of this type: here is one wire *e c* which is connected with one pole of the battery. The other pole of the battery is connected with this diaphragm *a d* which is held by its edges in the frame *b b*. If I place the end of the first wire *c* a quarter of an inch from the diaphragm, nothing happens, for the current cannot pass. If there is distance enough between to keep the current from passing, they might as well be in different countries. But if I bring them together as shown in the figure and touch them so that the current passes, then it will pass with a certain strength. The battery being the same all t time, the strength will depend upon the resistance . the point of contact of the end of the wire and th central part of the diaphragm. If I press it harder, there will be more current; if I press it less hard, there will be less current. Now, if I place them in contact and vibrate the diaphragm *d* by the voice, it will first move a little towards my wire end *c* and



push against it, and then will move back a little and press less hard against it. If I can regulate or arrange the contrivance so that the pushing and the pulling motions can be brought within such limits as never to make the disk and the wire-end part contact so as to interrupt the current, I shall have changes of pressure at the point of contact, and thus shall vary the current by the motions of the diaphragm and in accordance with them.

It has been found possible, but not altogether easy, to construct an apparatus of which that should be the type, — the current passing from the diaphragm or from something connected with it, to an electrode kept constantly in contact, but the one pushing or pressing upon the other more or less, according to the vibration of the diaphragm. In the cut which is one I happen to possess, the piece *c* is mounted on a spring *e* which presses towards the diaphragm. That apparatus, in its common form, is called a microphone. One of its various improvements is that while you may make the contact pieces, or *electrodes* as they are called, of many materials, the best material, or the best arrangement of materials found is to make either one or both of them of hard gas carbon, a substance which is deposited inside of gas retorts and is very hard and fine grained.



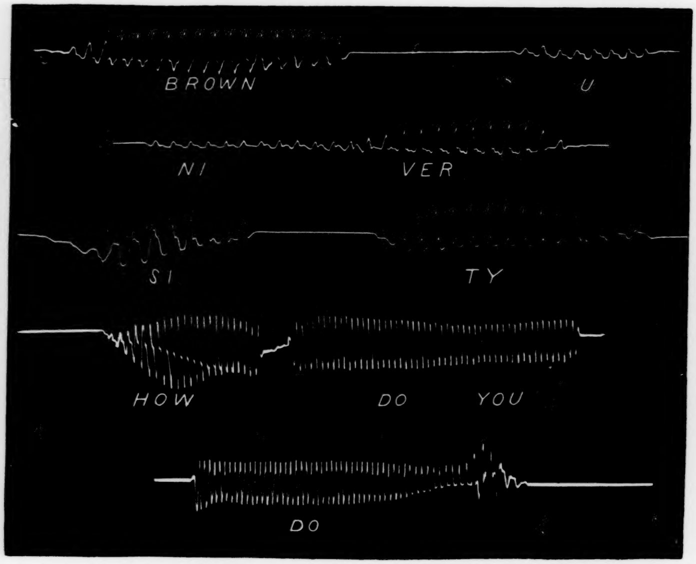
It is found that this possesses superior advantages, and will wear better than anything else that has been used. It is not the only thing that can be used, but it offers marked advantages, in many respects, over everything else.

The instrument I now show, the Blake transmitter, the one in commercial use, is an instrument of that kind. This cut shows the principal operating parts. The current from one pole of the battery is brought to *f* which is a spring, passes to the block *c* which is of hard carbon, — black in the instrument, — then to the little knob of platinum *d* about as big as a pinhead in contact with it, then through the delicate spring *e* to the distant station and back to the other pole of the battery. I omit reference to the induction coil, which has nothing to do with my present explanation. The carbon *c* and the knob *d* are not fastened together but merely held in gentle contact by the springs *f* and *e*, but the whole current has to pass through that contact. The knob *d* lies against the diaphragm *g*. If, now, by speaking into the mouthpiece against the diaphragm from the direction *g* (the mouthpiece being omitted in the cut), that diaphragm is made to vibrate, then on each particular vibration it is pushed back and pulled in again, — it is not a slow push such as I gave with my pencil, it is an extremely sharp. quick push, because it has to pass from one end of its motion to the other, as I am speaking now, in about the two-hundredth part of a second, — a quick, sharp push. Before this back electrode or anvil electrode *c*, as we call it, can get out of the way, the little knob on the diaphragm which presses against it gets squeezed in the process. If you hang up a sand bag, and strike it with your fist, there is a sensation of pressure on your fist, and that is just what takes place here. In the next movement, when the diaphragm comes back again towards *g*, that heavy weight will follow it by the force of the spring, but owing to the inertia due to the weight, it will not come quite so quick as the diaphragm. It takes a little time for it to follow, and while the diaphragm is moving away faster than the weight follows it up, the pressure is relaxed for a moment. Now, this instrument — and there are others, but this is the one in the ordinary use, known as the Blake transmitter — is so contrived that the pressure will be thus alternately increased and relaxed. The mechanical contrivances which accomplish this are the quick-moving diaphragm and the sluggish anvil electrode which carries the carbon. Its weight is what makes it sluggish. It weighs about seventy-five grains. If at any moment we have no contact, then we get into great trouble, for when there is no contact we lose all control of the current. All control ceases. When we get a flowing current we can control it and by it can control the receiver. What we have to do is to vary the current without interrupting it, and that apparatus is an apparatus which will do it.

If, in speaking, that vibration be stronger than the instrument is adapted for, or if you strike the box with the fist or with a pencil, the two electrodes *c d* jar apart, the circuit is broken, the current interrupted, and this makes a very disagreeable and rasping noise which is totally inarticulate in the receiver. In fact, I may mention one thing which may take place in the microphone. The speech which we hear at the receiving station is due to the vibration caused by the slight changes in the magnetic condition of the magnet of the receiver. In using that instrument I have a current flowing from the battery — a fairly powerful current, according to the size of the battery — all the time. An increase or diminution of pressure at the point of contact of the two electrodes makes a variation in this current, but a very small one. It varies it a little; even a little pressure varies the strength a little; but there is always contact sufficient to give a current. The variation is, perhaps, two or three per cent of the normal current. Now, if I suddenly stop that current by separating the electrodes, and then I bring them together again, see what I have done; instead of having a variation which will correspond to one fiftieth of the strength of the current, I have a variation which results from throwing on and off the whole battery; if the battery current be of the strength of one hundred, the speaking variations may be between ninety-nine and one hundred and one: but breaking the circuit makes a variation of one hundred to nothing, which is fifty times that large. The consequence of that is, that the magnetic change here in the receiver becomes very much greater, and I get a sound which is disagreeable and rasping to the ear, and very loud. The sound produced by the breaking of the circuit, in an ordinary instrument, can be heard several feet away. The sound produced by the ordinary variation of the current is so slight that you need to put your ear close to the instrument.

I have roughly described the electric transmission of speech; and yet, something more than description is needed to enable one to realize what it is. In their motions, these air particles do not, perhaps, traverse over the millionth of an inch. They occupy, with the ordinary voice of a man, only the two-hundredth of a second in going from one end to the other; with the voice of a woman perhaps half as long. They are minute and feeble almost beyond the power of expression, and yet I am going to rely on them to produce a sound at the distance of a mile, or of ten miles, or of a hundred miles away. I am to produce not only a sound, but to produce just the kind of sound that I want. Because if I do not do that, the mere noise will do no good. You must make the right kind of sound. Think for a moment what that problem is. I am going to make them not only produce a vibration, but I am going to do it so that when I speak one word in front of the transmitter, it will produce one form of vibration, and when I speak a different word it will behave differently. It must take note of the differences in vibrations between one word and another, and not only take note of them, but it must correctly repeat them. It must be actuated by those differences. Think what those differences are. In a journey which does not exceed the five-hundred-thousandth part of an inch in space or the two-hundredth part of a second in time, the differences between the way in which that air particle performs that minute journey in that minute period, under the influence of different words, must be such as to distinguish between every sound in such a way that the ear can readily distinguish one from the other. Think of what a myriad of sounds there are, and then try to imagine how minute must be the distinctions which separate the vibrations which are due to one word from those which are due to another, since such myriads of them can be packed within those minute limits of time and space. A speaking telephone has not only to take note of the existence of all those differences, but it has to earn its living by distinguishing between one and another; differences which, up to the time of the speaking telephone, men hardly more than speculated about the existence of, and barely had experimental proofs of the existence of, the speaking telephone has to make its living by. It takes almost the imagination of one used to dealing with infinitesimal and impossible quantities to realize the existence of differences so minute. One distinguished writer said of the telephone that it was an instrument that realized a mathematical conception. He said it well. The realities of the mathematician are what other men can only imagine; his imaginary quantities are what other men cannot imagine to be possible; it almost needs such an imagination to conceive of that which the telephone practically utilizes. You can almost apply to it the words of another mathematician, that it "harnesses a thought to the service of man." And yet so true is it to the laws of nature, that any schoolboy can make one *after he has been told how.*

Now I ask you to turn to complts, i, p. 31. You will find there a representation of some sound curves which were actually drawn by the voice of Prof. Pierce of Brown University. He arranged a diaphragm in such a way that he connected with it a little mirror; one edge of this mirror was fastened to a frame, and the other to the centre of the diaphragm. As the diaphragm vibrated the mirror also quivered in the same way. This mirror reflected a ray of light. He brought a ray of light into a dark room, and allowed a pencil of light to fall on the mirror and be reflected off to the other side of the dark room, so that you could see the spot of light on the wall. He thus in effect attached an amplifying lever about twelve feet in length to the diaphragm, — a beam of light, a lever without weight, without inertia, which would not bend or spring, which was perfectly true, and which amplified the motion. He moved a piece of photographic paper under that ray of light just as I did under my pencil, and as the spot of light vibrated on the moving sensitive paper, it left its mark; and this illustration in the record is a reduced copy of it. It was actually made by the voice, not speaking through a telephone, but by speaking directly against the diaphragm. He exerted his voice to the utmost, making it as loud as possible, and the motion thus obtained he amplified by the long lever which his beam of light gave him; and there you will see in the illustration, although not very accurately, yet you will see enough to give you an idea of the difference in the "form" of vibration which distinguishes "quality." If you compare the curves indicating the similar sounds, you will observe a certain similarity in the curves. Of course it is not accurate enough for anybody to read it, but it will give you an idea of what *form* of vibration means and is. It does not begin to be as accurate as the telephone. Those curves were, so to speak, actually drawn by the voice. A pencil was fastened indirectly to the air vibrations, and that pencil drew those curves.



The speaking telephone is to produce at a distance not merely an agitation of the air at the listener's ear, but just the right form of agitation; not merely the amplitude or loudness of the sound, nor the period or duration of the motion, the pitch of the sound, but just the right kind of sound. The Court will see that it will be difficult for a man to undertake to make an apparatus which will accomplish this peculiar, inconceivably delicate operation of producing the "form" of the vibration, unless he knew that that was just what he had got to do. You have got first to know what you have got to accomplish. It is not a thing which you can by chance stumble on in the dark; you do not evolve it by mixing up things in obscurity, and shaking them together. It is one of those inventions which is of a purely intellectual and scientific kind. Not that a man of mere intellect, or a merely scientific man, can do it; what we call invention is needed; but a man may go on working for a generation, no matter how high may be his intellectual or mechanical attainments, no matter how skilful he may be in making wood and iron move as he will, yet if he does not know what he has got to do to accomplish this thing, he will not do it. Before a man can devise a contrivance which will reproduce in the distance the *form* of vibration, even before he can set himself to work to devise such a contrivance, he must know what he is to set himself to work upon. Until a man knows that, until he knows what he has got to do, he will never find out to do it, — never find out the telephone. To use the words of a great master of acoustics, unless a man knows that, unless he knows what he is going to do, he will only spend his life in making ingenious contrivances to war against the laws of nature. He has got to know what is to be done. He has got to know not merely that he wants to get speech, but he has got to know what the diaphragm at the receiving station must do, how it must move before he can make a contrivance which will compel it to do it.

Alexander Graham Bell. To this task, Mr. Bell brought qualifications such as I think no man ever possessed before. It was not that he knew the scientific truths on which the telephone is based, better than other men. Not at all. It was that he had a kind of knowledge of them which other men did not have. He had been brought up from boyhood by his father, expecting to follow his father's profession, that of teacher of vocal physiology, — a profession involving a knowledge of how to produce and to perceive articulate sounds. His occupation for many years was teaching deaf-mutes to speak and to hear, so to speak, — teaching them mechanically to produce vibrations, the effect of which their ears could never notice; teaching them to recognize by sight these vibrations, or rather the motions of the organs which produce them, though their ears took no note of them; teaching them to produce mechanically, by placing the vocal organs in proper positions, the differences between one word and another. In that way, although perhaps scientifically he did not know more than others, he had got a kind of familiarity with this work, and a familiarity with these motions themselves, considered apart from audition, such as a workman gets with his tools. He made his living by them. They gave him his daily pleasure and his daily bread. He got that familiarity with them, and that reliance upon them, which led him, when he came to consider the subject of the transmission of speech, to do what mere learning would not have caused him to do, and which he could not have done without the training which his position had given him. He had very early thought of the possibility of thus communicating speech, but not as men may think of flying, or of other absurd things, as being a thing which cannot be done. His mind had been working in this direction. He saw within what limits the solution of the problem lay.

In the summer of 1874, he conceived the plan by which it might be done. He communicated that to his father, and his father made a note of it in his note book, not with sufficient fulness to show what the plan was, nor has his father any distinct recollection of it, but merely enough to know that the matter was spoken of. In the fall of 1874, under circumstances which it is not now necessary to spend time in repeating, he disclosed to Prof. Blake, of Boston, the distinguished aurist and professor at the Harvard Medical School, the method of transmitting speech, and a description of the apparatus by which he proposed to do it; and what he then disclosed to Dr. Blake was the method described in his patent, and the particular form of apparatus which is described in his patent, to wit, a stretched membrane with an armature fastened to the centre of it, vibrated by the voice, in front of an electro-magnet. He did not make the apparatus, but he described it to Dr. Blake, and Dr. Blake has testified to the particulars of the description. During that same winter he repeated the same description to Prof. Cross, Professor of Physics at the Massachusetts Institute of Technology; he has been a witness and has narrated what Mr. Bell said. But there was one difficulty which struck him as being in the way, as he then thought. He was to use these minute vibrations, or these differences between the vibrations, each of which was so minute as to almost defy detection; he was to use the differences between one and another to produce electrical currents, and not only to produce currents, but to produce such currents as would cause audible effects at distant stations.

Now, it was inconceivable (and the more a man knew about electricity and acoustics, the more he would believe it was impossible) that such feeble currents as these vibrations of the air would produce by means of such a contrivance, would be practically worth anything in the production of sound: they would doubtless be too feeble to be of any value. So he set himself to work to devise, not a different method, but an improvement, change or alteration in the apparatus which he had designed to accomplish that thing in accordance with that method. In the course of the year 1875 he had found out, in the course of experiments with other instruments, that currents generated by a slight vibratory motion of an armature in front of an electro-magnet had vastly more force than he supposed. They revealed to him that his proposed speaking telephone was not an impossibility. The moment when he made that experiment, or when the accident happened which revealed to him that fact in electricity and acoustics, he instantly, within the hour and before leaving the room, gave instructions to his assistant to make precisely the instrument which eight months before he had described to Dr. Blake.

The history of Mr. Bell's life is detailed in his deposition, but the substance of it is detailed in letters written at the time, and is not dependent upon anybody's memory. I will read an extract from one of them. He was employed in inventing the harmonic multiple telegraph, and had been for several years thus engaged. This is a contrivance which produces sounds of various pitch, and telegraphs by means of them; and the idea was to transmit simultaneously as many messages as he could simultaneously produce different notes at the end of a telegraph wire, and thus send six or eight or ten messages simultaneously over a single wire. That was before the quadruplex system came into use, and an instrument of that sort would have been of enormous value. It had nothing to do with a speaking telephone. The contrivance which he had made, up to a certain stage, had nothing to do with a speaking telephone, but it gave him some useful electrical knowledge. It taught him what to avoid rather than what to copy. The patent for the speaking telephone has two branches; and one of the sets of instruments, and one kind of operation ascribed to that set of instruments, was intended for the harmonic multiple telegraph. That is the instrument shown in Fig. 5. Another set of instruments is the one which I have referred your Honor to as the speaking telephone, to wit, Fig. 7.

In the early part of March, 1875, Mr. Bell was in Washington on business connected with his harmonic multiple telegraphic inventions, expecting at that time an interference with another and rival inventor in that same branch of telegraphy. At that time he went to see Prof. Henry, and told him of some experiments which he had made in the production of sound by electricity. Prof. Henry became interested, and asked him to repeat them. The story of that interview was told by Mr. Bell, in a letter to his father and mother, written a few weeks later; and I propose to read an extract from it to your Honor. You will find it on page 47 of our brief, and in complts, i, 126. It is dated March 18, 1875: —

> "We appointed noon next day for the experiment. I set the instrument working, and he sat at the table for a long time with the empty coil of wire against his ear, listening to the sound. I felt so much encouraged by his interest that I determined to ask his advice about the apparatus I have designed for the transmission of the human voice by telegraph. I explained the idea, and said, 'What would you advise me to do, publish it and let others work it out, or attempt to solve the problem myself?' He said he thought it was the germ of a great invention, and advised me to work at it myself, instead of publishing. I said that I recognized the fact that there were mechanical difficulties in the way that rendered the plan impracticable at the present time. I added that I felt that I had not the electrical knowledge necessary to overcome the difficulties. His laconic answer was, 'GET IT.'
>
> "I cannot tell you how much these two words have encouraged me. I live too much in an atmosphere of discouragement for scientific pursuits. Good . . . is unfortunately one of the *cui bono* people, and is too much in the habit of looking at the dark side of things. Such a chimerical idea as telegraphing *vocal sounds* would indeed, to *most minds*, seem scarcely feasible enough to spend time in working over. I believe, however, that it is feasible, and that I have got the cue to the solution of the problem."

Mr. Bell's history is stated in the letters contained in the brief, and in his deposition. In one sense it is not material to the case, though it might possibly become material in one view of the case to know whether his invention is to date from the filing of his application, or whether it is to date from some previous time. In considering that question, which I shall endeavor to consider by and by with the authorities, if I have time to spare, there is nothing now so important as to inquire whether, from the time he first had the conception (and he had already described the conception of his apparatus to two men perfectly competent to understand about it and to report about it,— Dr. Blake and Prof. Cross), he was fairly pursuing that plan, and endeavoring to reduce it to practice, or whether he had thrown it away as something not worth following. He went to Prof. Henry in February, 1875. He stated to him his troubles, his plan, his belief, his conception, and further stated that he felt the difficulty of *reducing it to practice* by reason of lack of knowledge; and he inquired of Prof. Henry what he should do, whether he should give it to the world as it was, in the confidence that better informed men would work it out, or work it out himself. Prof. Henry said to him, "Work it out yourself"; and he did do it. Now, when your Honor is called upon to consider whether in that matter Mr. Bell did wisely in pursuing the course that he did pursue, you will have to consider, first, the fact that it led to the speaking telephone within a year; and secondly, the fact that when the conception of the invention and the difficulties of the conception were disclosed to the man of this whole continent best qualified to judge what Mr. Bell should do, he said to him, "Do what you are doing. Go on in that way." And Mr. Bell went on in that way, and perfected the invention. He would be a bold man to-day who should say that the course of conduct which did, in fact, within a year, lead to a speaking telephone patent, and which at that time was approved by Prof. Henry as the proper, reasonable and just way, was so absurd and so unreasonable as to afford ground to think that this man meant to throw the invention away and think nothing more about it.

Follow down his letters, and you will see how, all the time, the speaking telephone filled his mind. He was working very hard on other things, supporting himself by teaching while he was working on some other electrical inventions, which he had begun long before, and in prosecuting which he had a partner, his engagement with whom required him to follow them out; but letter after letter showed how the speaking telephone filled his mind, not as a thing which men think of as they do of flying machines, or of perpetual motion, but as a thing that was feasible.

Mr. Edmunds. What was the instrument which he showed to Prof. Henry?

Mr. Storrow. What he actually had there and showed was a contrivance in which there was a current breaker at one end and a coil at the other, and which when pressed against the ear produced a musical note. I think it is described in the letters; at all events, it is described in the evidence; it had nothing to do with speech.

Now I come to the patent: Mr. Bell drew his specification in the fall of 1875. The filing of it was delayed by reason of the fact that he had arranged with a Canadian friend, who was going to England, to take out an English patent. Finally he became impatient and would wait no longer to hear from England, and filed his application Feb. 14, 1876, and the patent was issued March 7, 1876, No. 174,465. Then he came to the Centennial and exhibited his instrument there. When he got his patent, he went to work to improve the instrument, and did improve it, as we will show; and then he exhibited it at the Centennial. On the 25th of June, 1876, he transmitted speech at the Centennial with his instrument in the presence of the Board of Judges, two chief men of which were Prof. Henry and Sir William Thomson. After that exhibition, they took the instrument to the Judges' room, and continued to experiment therewith during the following week. They made reports, which appear in the record, in which they say, each of them, and Prof. Henry very strongly, that this contrivance of Mr. Bell's is the greatest marvel since the electric telegraph, and gives a most wonderful and surprising result. The reports are printed and the instruments described in complts, i, 232-239, complts, ii, 1685. Instantly all the newspapers took it up; it filled the world; it was announced all over Christendom. In a few weeks Mr. Bell became famous all over the world as the man who had invented that which the world had never known before; and so he went on. In the spring of 1877, he had got his instruments more and more improved. Appliances to go with them had been made. A business organization to put them into public use had been arranged. He went on, until now, as your Honor knows, the whole world is filled with them.

The advent of Drawbaugh. In the summer of 1880, there appeared in the newspapers this paragraph, from the *Cincinnati Commercial* of July 22, 1880 (complts, i, 13): —

"TELEPHONE COMBINATION.

Special to Cincinnati Commercial.

WASHINGTON, D. C., July 21.

"An application for a patent was filed to-day, that in consequence of its vastness of interest as well as wealth of prospect, renders it a subject of national interest. A company of leading business men has been formed that has bought up all the telephone patents antedating those now in use, and known as the Bell, Gray and Edison patents. The company is composed of leading business men from all parts of the country, Cincinnati being largely represented and interested. The cash capital of the company is $5,000,000, with headquarters in New York; and in about sixty days they will open up the telephone, which will certainly result in the driving out of all telephones in the market, save the ones they hold, or else the compelling the Gray, Bell and Edison lines to pay the new company a munificent royalty. It appears from the testimony now on file and in the possession of the new company, which is conclusive and exhaustive, that the inventor of the telephone is a poor mechanic, living near Harrisburg, Pa., named Daniel Drawbaugh. Owing to his poverty, he was unable to push his patent on the market. The new company have secured and are sole possessors of this invention, antedating those now in use. They are also owners of four patents for telephones issued to Mr. Klemm, of New York. A large number of capitalists were here to-day to see the filing of the application, and they assert, with a positiveness which is almost convincing, that it will not be long till they have entire charge of the telephones, not only in this country but in the world, and that they will be able to establish lines by which messages can be transmitted for almost a song.

"Mr. Lipman Levy, of the law firm of Moulton, Johnson & Levy, of Cincinnati, was here to-day in the interest of the Cincinnati parties, who, as already stated, are among the most prominent financial men of our city."

Of course we saw that. It was the first announcement, to the world at large at any rate, whatever may have been known in the vicinity of Drawbaugh's workshop, — it was the first announcement to the world at large that Drawbaugh claimed to be the inventor of the telephone. It came out over four years after Mr. Bell had become famous as the inventor. It came out when his instruments had been for more than three years in extensive public use in this country and abroad. We examined the matter. What was the story? It was, that a man living near Harrisburg, as it turned out the story was, had for ten or a dozen years in his possession instruments which he now said were speaking telephones; that fifty or a hundred people knew of them, but that not one of them had ever gone into use, and that they had never been brought to the Patent Office. It seemed to us at the first blush that the more men there were to prove that they knew of the existence of an instrument of which such things were alleged, and concerning which the facts were that it never went into use, and never went to the Patent Office, the more witnesses there were to prove that that thing was a failure, or that there was something about it which did not permit it to be used practically and usefully, and did not enable it or entitle it to be used as or called a speaking telephone. The more witnesses there were to such a story, the stronger the proof that no facts existed which could destroy a patent. We then brought this suit. The bill was filed Oct. 20, 1880. With it we filed a motion for a preliminary injunction, with affidavits and evidence in support of it, and the case came on to be heard in November, 1880, before Judge Blatchford. The defendants, in response to that motion, did not set up that Drawbaugh was the prior inventor. They had their pockets full of affidavits, they had lots of affidavits of these very persons whose depositions fill this record, but they did not set that up. They said nothing about it. Their answer to our motion for an injunction was, that they had not made any telephones, that they had not threatened to make any telephones, that they had not determined whether they would make any telephones, but that they were then waiting the opinion of counsel whether all these alleged inventions and pretensions of Drawbaugh's which they said they owned, were enough, or whether there was enough in that story to constitute a defence, and make it safe and prudent for them to make them (affidavit of Lewis Abraham). They had not yet reached that point. His Honor, Judge Blatchford, for obvious reasons granted an injunction, and that injunction has continued in force.

I now want to state the story of Drawbaugh, the story which the defendants set up as the history of his invention. The best way for me to do that, is to read one or two passages from their answer. That those may be the better understood, I ought to state that the bill itself was not simply a bill for infringement. It anticipated this defence. It was aimed directly at it. It alleged that the defendants, having determined to make telephones which they found were an infringement of our patents, having predetermined to do that, and hearing afterwards that Drawbaugh claimed to have made some early experiments, which experiments we alleged were incomplete, imperfect, unfruitful, and long ago abandoned, they bought him up for the purpose of setting him up as a prior inventor, and that neither he nor any of the defendants had done anything to advance the art of the transmission of speech; that the community had never acquired anything from them; that no instrument of Drawbaugh's had ever gone into use anywhere; that the instruments which the defendants had proposed to put into use were not his instruments, and were not copied from his in fact or in law; but that all instruments in use were instruments gotten up by independent inventors irrespective of Drawbaugh, and that the defendants hunted him up and brought him forward merely as a defence for an infringement already determined upon. It was in response to allegations of that character that they filed an answer in which they state as follows, — I read from defendants' answer (defts, i, 6): —

"Further answering, this defendant says: that Daniel Drawbaugh of Eberly's Mills, Cumberland County, Penn., was and is the original and first inventor and discoverer of the art of communicating articulate speech between distant places by voltaic and magneto electricity, and of the construction and operation of machines and instruments for carrying such art into practice; that, long prior to the alleged inventions by said Alexander Graham Bell, and long prior to the respective inventions of said Gray and said Edison, said Daniel Drawbaugh, then and now residing at said Eberly's Mills, constructed and operated practical working electric speaking telephones at said Eberly's Mills, and exhibited their successful operation to a great number of other persons resident in his vicinity and elsewhere; that the said electric speaking telephones, so constructed and successfully and practically used by him, as aforesaid, contained all the material and substantial parts and inventions patented in the said patents No. 174,465 and No. 186,787, granted to said Bell, and also contained other important and valuable inventions in electric and magneto-telephony, and were fully capable of transmitting, and were actually used for transmitting articulate vocal sounds and speech between distant points by means of electric currents; that some of the original machines and instruments invented, made, used, and exhibited to many others long prior to the said alleged inventions of said Bell, or either of them, are still in existence, and capable of successful practical use, and are identified by a large number of persons who personally tested and used, and knew of their practical operation and use, in the years 1870, 1871, 1872, 1873, 1874, and both subsequently and prior thereto; that certainly more than fifty, and probably not less than one hundred persons, or even more, were cognizant of said Drawbaugh's invention and use of said telephones, and of his claim to be the original and first inventor thereof, prior to the alleged invention of said Bell, or either of them."

Then on the next page it is further alleged: —

> "That the said Daniel Drawbaugh, after making, testing, using and extensively exhibiting his invention to others, and allowing them experimentally to personally test and ascertain its successful practical operation and utility, as aforesaid, and after the full and repeated demonstration of its successful working, as aforesaid, conceived that its range and capacity of usefulness to the public might be very greatly enlarged," and thereupon made additional improvements to "increase its value to himself and to the public."

Then near the bottom of p. 9, to meet directly the allegation made in the bill, that he was not a true and successful inventor of the speaking telephone, the answer alleges: —

> "That said Daniel Drawbaugh's original invention was complete, successful, operative, and practically and successfully operated and reduced to practice as a 'speaking telephone' on many occasions in the presence and hearing of many other persons, and knowledge thereof was freely communicated to the public by said Drawbaugh; and that said Drawbaugh's improvements, additional to his said original invention, were complete, successful and practical inventions; that all of his said inventions were fully reduced to practice and communicated to others."

That certainly states a defence.

We had put into our moving papers, not merely the date of the patents, but the date of Mr. Bell's invention as of the fall of 1874. In the face of that allegation, and obviously to meet it, the defendants allege that long prior to Bell's invention, and "in the years 1871, 1872, 1873 and 1874," Drawbaugh had a practical instrument, not only capable of transmitting, but which actually did successfully and practically transmit speech between distant points, in the presence of many persons; and that he freely communicated this invention to others. This is all admittedly false. The evidence does not profess to come up to that.

The statute requires the defendant, in a case like this, to state the names of the persons who had the prior knowledge or made the prior use, and the places where; yet the only name given, and the only place given, is the name of Daniel Drawbaugh, and at his residence. That is, he is the only person alleged to have had prior knowledge, and his residence the only place of the alleged prior use. I do not mean to say that that would disable the defendants from bringing other witnesses to prove that he did use them there, or that they assisted him in using the telephone, as it took two persons to use it; nor perhaps that others used it there in his presence or with his aid; but they could not, under that answer, prove use by other persons at other places. *They did not attempt to do so.* Although the allegation is that it was used for transmitting speech between "distant" points, and that the instrument with which that was done was "still in existence and capable of successful practical use," the most that he or any witness pretended to have done, was the transmission of sounds, whatever they were and whenever it was, between one part of his workshop and another; sometimes between one room and another, and sometimes between different ends of the same room. That is all The answer alleges "practical use." The strongest proof proffered is that there never was a moment of practical use in any proper sense. He never used them even for his own business, to communicate with his workmen, or with other people in the building, or for any purpose of utility. He kept them in a cupboard and from time to time took them out, — that is the story, — and connected them with wires, sometimes to wires standing in the building, and at other times to wires which he held in his hand, and talked from one part of the workshop to another to visitors who came in.

Now, we begin with this most persuasive allegation, that the instruments were "practically used" for transmitting speech between "distant" points; but it comes down to the use, in his own private workshop, from one room to another, to use the words of Judge Shipman in a recent case, "for the purpose of experiment, or to gratify curiosity," and never for anything else. That is not all. The anwser says "that some of the original machines and instruments made, used and exhibited to many others prior to the alleged invention of the said Bell, are still in existence, and capable of successful practical use, and are identified by a large number of persons who personally tested and used, and knew of their practical operation and use in the years 1870, 1871, 1872, 1873, 1874, and both subsequently and prior thereto."

They produced a number of exhibits, which they say were made during those years. *No set of instruments alleged to have been made during those years specifically named, is in such a working condition that it can transmit a sound;* parts remain; that is all. There is in fair condition one *receiver* (A) which is alleged to have been made in those years, and nothing else. It takes both a transmitter and a receiver to make a telephone. Out of all the instruments alleged to have been made in those years, or by means of all the instruments now produced as in existence at the date which we claimed in our papers for Mr. Bell's invention, or which are alleged to have been made in those years specifically named, it is impossible to transmit a sound of any kind, so destitute are they of proper working parts. They are wrecks and scraps. A defence resting on them is a scrap-heap defence. But that is not all. This thing never went to the Patent Office. No patent was applied for until the summer of 1880. Did it come into use? Let me read from the answer again. The answer says, in one passage which I read, referring to the use by others, that they used it only "experimentally." It further says (defts, i, 10): —

> "This defendant, further answering, says that so far and to such extent as electric speaking telephones were put on sale and into public use in this country, by others than said Drawbaugh, prior to said Drawbaugh's application for a patent thereon, as aforesaid, such specific machines and instruments, so put on sale and into public use, were not the specific machines and instruments invented by said Drawbaugh, as aforesaid, but were machines and instruments invented by others, subsequent to the original and first invention of the electric speaking telephone by said Drawbaugh, and subsequently to the invention of his said improvements thereon, as aforesaid; and that, as this defendant is informed and believes, such machines and instruments were so put on sale and into public use, not from or by reason of any information derived from or through said Drawbaugh, but by an inde-

pendent invention or independent inventions thereof by others, . . . and by reason of knowledge and information of their construction and operation not derived from or through said Drawbaugh."

Now we begin to get at the story which they undertake to prove, which is, that this man, for years before Mr. Bell's invention, had, as they say, instruments used only for the purpose of experiment or the gratification of curiosity, in his own workshop, and not for any other purpose, nor elsewhere; which now, so far as those which are alleged to have existed before Bell's *invention* are concerned, are mere wrecks incapable of use to-day; that he never took them to the Patent Office; and that although many people knew what he did, no instrument of his ever went into practical use; and no man, from all that he ever saw or learned of those instruments during all those years, ever learned how to make a telephone, or how to transmit speech, or did make a telephone, or did transmit speech in consequence of anything that Drawbaugh had ever done.

That is not the story which is set up in the answer, — there they tell a story which is colored to make a case, and the color is false; but the story they try to prove, stripped of the color which they admit is false, is a story that is very familiar to courts in patent causes.

There is one more thing I wish to state. We allege in our bill that this matter of Drawbaugh was not what led the defendants to make their telephones. It did not, even in the hands of the defendants, lead to the transmission of speech by them; but they had already made telephones, in forms of their own, which were mere colorable imitations or infringements of our patents; they learned how to talk from Mr. Bell; and after that, not for the purpose of using Drawbaugh's instruments, but for the purpose of using Drawbaugh's deposition, they hunted him up, and set up what he had done as a defence.

[*Intermission.*]

In May, 1880, three gentlemen, who are before your Honor in this case, Mr. Chellis of Harrisburg, store-keeper, who had been for about a year or a year and a half a partner of Drawbaugh in another invention upon which they were striving to get a patent,— an improvement in molasses faucets, — together with Mr. Jacobs of Harrisburg, the lawyer and counsel in litigation about that molasses faucet, and Mr. Hill of Washington, counsel also in part of that litigation, — Mr. Jacobs and Mr. Hill being the counsel who have had charge of the preparation of this case for the defence, and Mr. Chellis being a director of the defendant corporation, and himself an individual defendant; these three gentlemen arranged with Drawbaugh to take from him, and did take from him, three quarters of whatever pretension he had for any invention he had made relating to telephones; and for that transfer they paid him nothing, and they agreed to pay him nothing, except what might come out of their enterprise. They took three quarters of his pretensions, paying nothing, not agreeing to spend any money or do anything about it. Before the month was over, there had come to Harrisburg two men, one from Washington and one from Cincinnati, —Mr. Simon Wolf of Washington, and Mr. Moritz Loth of Cincinnati, — who negotiated with those three gentlemen for the purchase of whatever Drawbaugh had, more or less. They immediately consummated the purchase, and the consequence was, that in the course of a few weeks these pretensions, three quarters of which had been got for nothing, were resold to these parties for $20,000 in cash, and a large amount of stock, so large that the defendants decline to state what it was, except that it is a very considerable amount. A few weeks more passed, and these pretensions had blossomed from nothing into a corporation with five millions of capital. That is the defendant corporation.

Why did they want these pretensions of Drawbaugh? We allege in the bill, that these men, Simon Wolf and Moritz Loth, with two others, Marcus Marx and F. A. Klemm, had determined to put out telephones of a certain pattern which they were advised would be an infringement upon our patent; after which they bought up Drawbaugh's testimony, and the right to use his testimony to defeat our patent, and to protect themselves in that which they had already predetermined to do.

In the course of this case, the defendants put upon the stand, Chellis, one of these three men, the Harrisburg store-keeper; and Mr. Hill, another one of these men, examined him, and put to him this question (defts, i, 559): —

"*Int.* 106. When Mr. Wolf first came to you to negotiate for the purchase of the Drawbaugh invention, did he or not tell you that he represented a party who had already purchased the telephone inventions of Klemm and Tisdel, and were purposing to enter upon their manufacture and sale, and that they expected trouble with the Bell Telephone Company, who claimed to monopolize electric telephones of all kinds, and that they had already fully determined to test the validity and scope of the Bell patents, and the question whether the Klemm and Tisdel telephones were infringements thereof? What, if any, statements did he make on these several points?

"*Ans.* He did say something to that effect; it was in Mr. Jacobs' room in the hotel at Harrisburg, — I cannot recollect the exact words he said, — it was to the effect that they wanted to use it in evidence against the Bell Company — I mean they wished to use the Drawbaugh invention in evidence against the Bell Company."

I said before recess that the work which Drawbaugh did, whatever it was, never led to anything. It did not even lead to the existence of this defendant corporation, in a sense; it did not even lead to their infringing telephones, — they had made them, and afterwards, as a defence, they sought him out. He is a man whose work, whatever it be, has led to nothing except a defence to a lawsuit.

Look a little at the position of these two men, Bell and Drawbaugh, in the summer of 1880, when the defendants' newspaper proclamation came out. Do you want to know whether Mr. Bell had invented the telephone? Look at every instrument in every part of the world, which transmits speech by electricity; take every individual instrument; its history leads up to him as its origin, — actually leads up to him. In this country there were then one hundred thousand of them in use. Every one of them not only led up to him in a general sense, but they were actually manufactured and put into use by him and his associates constituting the Bell Telephone Company. He had done all that the law requires a man to do to get a patent; he had done all that which it is the object of the patent laws to have a man do, namely, he had disclosed to the world this great art of transmitting speech at a time when the world did not have it. No one else can ever do that again since 1876, when Mr. Bell did it; no man, be he prior inventor or subsequent inventor, could ever disclose that as a novelty. The community had no reason to offer the reward of a patent again, nor any longer, for it had got the art.

Mr. Bell had done more. Relying upon the patent which he had purchased by his disclosure of what he had invented, and which was given to him as a reward for that disclosure, he had taught this art to the public; under the promise of the patent he had made the disclosure, and under the promise witnessed by the seal of the United States, the public had got the benefit of it. He and his associates, relying upon the promise and the grant so earned, had gone on and added to his invention the many improvements due to the genius of subsequent inventors, together with their time, skill, capital and business experience. There were 100,000 instruments in this country. Think what that means; think of the capital which had gone into the business, and of the thousands and thousands of miles of wire that implies. That is what he had done. That was what the community owed him for, and had promised to pay him for. All that the patent can give, he and his associates have earned and paid for.

What have these other men done? Their instruments and their ideas, whatever they were, have led to nothing, taught nobody anything, and were used solely for the purpose of experiment, or the gratification of curiosity. If they had not existed the community would have had speech by electricity just as soon as it did. That is not an entirely new story. When that kind of story is presented, when such a patent as this is presented on the one hand and such a story as this on the other, — not the story of the answer, but that which I have stated, — such a defence against such a patent has always failed. Why? The pretender says, "I did not earn the patent; you earned it. I did not communicate the information; you communicated it. You earned the reward. What have I done? Nothing for the community; but *I have found a flaw in your title, and I want your property.* I have sat by for four years, until I have seen these lines of telephones and this great property grow and grow and grow, and money — your money — go into it, and now I have found *a flaw in your title*, and I want that property turned over to me. I want possession of all the telephones in the world, or else to be able to wring from the Bell Telephone Company a 'magnificent tribute' for the privilege of keeping what they have earned and paid for." Is that a case which will recommend itself to the court of equity?

Such defences have always failed for a hundred years, not merely because they do not recommend themselves to a court of equity, but *because a Court does not believe that kind of a story against that kind of patent.* The courts have again and again laid down the rules by which they are to be governed in these controversies. If I had time, I should like to read to your Honor a few of the authorities. They are collected in our brief, pp. 97–133. These authorities are not merely to the familiar rule that there must be a practical instrument, a successful instrument, but to the kind, the value, and the character of proof required to establish such a defence in such a case. One and all, they hold that it must be made out by proof that leaves no doubt on the mind of the judge; it must be clear, distinct, unmistakable. To doubt is to dismiss the defence, said one judge. "Every doubt must be resolved against the party who sets it up," said the Supreme Court. That is not all. What kind of proof is to be brought? Do you rely mostly upon the recollection of men who say that years ago they saw or heard of such a thing? The courts have decided over and over again that the only proof that is worth anything in such a case, where you have to go back a series of years, is proof of results, proof of consequences, proof of conduct. For the courts know that if a man had such a thing as a speaking telephone, something would have come of it, — it would have been heard of and in every sense; the courts look upon the conduct of a man, or his surroundings, what he did, what such things led to, not as evidence making the story more or less probable, but as the best and the only positive, direct and unequivocal proof for or against the fact; not as raising a question of probability, but as absolute proof. That is not all. They look upon the facts of a man's conduct — not to what the man says he did, but to what resulted from it — as the only proof satisfying to the mind in a contested case of an invention where the claim is brought forward at a late day.

Your Honor knows the case of Atlantic Works *v.* Brady, 107 U. S. 203. There nobody specifically contradicted, and nobody was able to specifically contradict, what Brady and a number of witnesses swore to. Yet the Court said that his conduct, "what he did and did not do," and his silence in his intercourse with his associates, were such evidence that no recollections and no depositions of men who say that he disclosed and described to them his invention could weigh against it. As a matter of law and public policy, the Court cannot rest on such evidence. Your Honor knows one of the earliest cases, that of the cotton gin, where men swore that they had seen the cotton gin and used it. The Court said there were facts known to everybody which far outweighed that. All those authorities have been collected in the brief (p. 107 *et seq.*), but I shall not stop to go over them.

There are one or two rules of proof which are important. Lord Mansfield laid down a rule which has been enforced by the Supreme Court in a great many cases, "that the evidence is to be weighed according to what it would have been in the power of one party to have produced and in the power of the other to have contradicted" (brief, p. 129). When evidence tending to support an issue of this kind produced by the party upon whom the serious burden rests, though of itself persuasive, yet falls far short of what the truth would furnish if his story were true, the courts do not look upon it as evidence tending to prove his case, but as tending to disprove it. If the evidence, however it tends to support his story, is far short of that which the truth of his story would have created and brought before the Court, the Court say that the fact that his evidence does not come up to the full measure of what the truth of his story would furnish is proof (if I may use the expression) that it does not fill the bill, does not come up to what the party would have produced as evidence if his story had been true.

But that is not all. These rules of proof are rules which are not merely laid down as suggestions for the Court, they are rules which a Court has got to follow, rules which come up almost to the binding effect of the statute of frauds; they have acquired a standing and position where the doctrine of *stare decisis* applies. Parties rely upon them. That is not all. It is not merely that, but parties make their arrangements relying upon the faith that the courts will follow them. Defendants prepare their cases in view of them, and if this defendants' record does not come up to what the rules require, it is because the facts will not permit it, not because they did not know what consequences would follow their failure.

What I am to deal with, and what I am to spend a little time on now, in my part of this case, is not so much a conflict of testimony, as where a man says that on one day he saw something, and another man says that being there on that day he did not see it; but what I now wish to set forth is this man's history, — in the language of the Supreme Court, his conduct, — what he did and did not do, and then ask your Honor whether, in that history, you can find a speaking telephone. If you cannot read it in his life, it is of very little use to try to read it in his deposition. I shall not deal with disputed facts, but with certain uncontroverted facts found in the defendants' volumes or proved by writings. Why was it? How can it be? How can you reconcile the story they have told of perfect speaking telephones for years and years and years, — instruments known to many people, — hundreds of people, — perfect speaking telephones, they say, — with the *facts* that no one used them, no one carried them to the Patent Office. There is one excuse, there is one explanation proffered in the answer, and only one offered in the answer, which I will read as they state it. I read from p. 7 of the answer: —

> "That said Drawbaugh for more than ten years prior to the year 1880 was miserably poor, in debt, with a large and helpless family dependent upon his daily labor for support, and was for such cause alone utterly unable to patent his said invention, or caveat it, or manufacture and introduce it upon the market."

Then in another place they allege, —

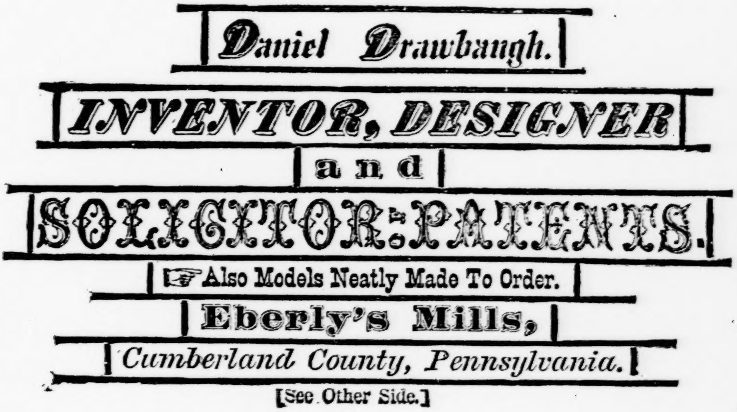
> "His utter want of proper mechanical tools, materials and appliances."

What do they mean by that allegation? Do they mean that, having conceived the invention, he was not able to reduce it to practice? We have heard of that in other patent cases; but that is not what they state here. For if they came here and stated that he had never reduced this conception to practice until after the telephone had been heard of from Mr. Bell, that would not be even a plausible case to aver to a court. Their story and their evidence, if believed, are to the effect that he devoted years and years of labor to it, made instrument after instrument, reduced the invention to practice, made perfect instruments, that he had the time for that, the materials for that, the tools for that, the means to support himself while he was spending years and years on this thing which produced no profit, — but their explanation is, that, when he had made a perfect speaking telephone after years and years of labor, he did not have the time or the means to make one more pair, duplicates of the last, to take over to Harrisburg, three miles off, and sell. That is the story. It is not the story that poverty prevented him from reducing them to practice, but that poverty had prevented him from using them after he had made them and reduced them to practice. Such a story is false on its face; but it is also disproved by the undisputed facts of his history. I am going to show from his own deposition, from papers, that he had plenty of means, plenty of materials, plenty of tools within his reach, and also plenty of rich and influential friends.

Perhaps I cannot begin better than by stating that in the summer of 1879 he gave a deposition for himself, in his own behalf, under the care of Mr. Jacobs, his present counsel, in an interference pending in the Patent Office between himself and a man by the name of Hauck, on an improvement in molasses faucets. In the course of that deposition he was called upon by his own counsel to give some testimony in the nature of expert testimony; the other party objected to it; his own counsel qualified him as an expert by having him swear that he had been making inventions all his life, that he had patented a good many of them, and had acted as solicitor of patents for other parties, not to a great extent, but in some cases, enough to show that he was familiar with patents and the way to obtain them. (See our brief, p. 196, and complts, iv, exhibits, p. 123.)

It was quite incredible that such a man could have had an actual speaking telephone for a dozen years and not have patented it. It was so impossible to reconcile the story with the fact that they thought it best to have him deny the fact, though he had once sworn to it. So he was put upon the witness stand, and denied that he ever considered himself capable of drawing a patent specification (brief, p. 197, defts, ii, 900); but afterwards a printed card was gotten hold of which he printed, and which he has never ventured to deny. We called the printer, put in the card, and since then he has never ventured on the witness stand.

There is the card. That card was published not earlier than



Daniel Drawbaugh.

INVENTOR, DESIGNER

and

SOLICITOR:PATENTS.

☞ Also Models Neatly Made To Order.

Eberly's Mills,

Cumberland County, Pennsylvania.

[See Other Side.]

the summer of 1874, at a time when, according to his story, he had had electric speaking telephones for six or eight years; at a time when for eight years he had been spending most of his time upon them, when, according to his own story, he was very poor; at a time when for years and years he had announced to his friends that the speaking telephone was the greatest invention in the world, and a fortune to any man who could bring it out, — if you believe what they want you to believe. There is his card —" INVENTOR, DESIGNER, SOLICITOR OF PATENTS." That is not all: he is a model maker, "MODELS NEATLY MADE TO ORDER." That card was published at least as late as the summer of 1874, and another edition after that (brief, p. 196; complts, ii, 1212, ans. 10). If this man's story be true, he had had for years and years the electric speaking telephone, which was the greatest work of his lifetime.

But that was not all. Some time, about 1875 or 1876, he printed a bill-head; it is in the record, and here is a photo-lithographic copy of it.

________________ *Cuml. Co., Pa.* ________________ *18*

M ________________________________

Bought of DAN. DRAWBAUGH,

PRACTICAL MACHINIST,

Small Machinery. Patent Office Models, Electric Machines &c. a specialty.

Now, what do you think of a man, —a model maker, a professional inventor, a professional patentee, —making the construction of electrical machines a specialty, and so advertising in print; who had a speaking telephone for ten years, and never made a practical use of it, never patented it, never made one for practical use? But that is not all. In that card, calling himself an "inventor," he puts, on the other side, a list of those things upon which he chooses to rest his claim to that title, — a list of sixteen or eighteen inventions, and contrivances, — *but no telephone among them.* Here is the other side of the card: —

Dan'l Drawbaugh,

INVENTOR OF

THE FOLLOWING PATENTS.

Stave, Heading & Shingle Cutter.
Barrel Machinery.
STAVE JOINTING MACHINE, Many in use.
Tram & Red-staff for leveling face of Millstone.
Rine and Driver for running Millstone.
Nail Machinery for Feeding Nail Plates.
PUMPS, ROTARAY & OTHERS.
Hydraulic Ram.
THE DRAWBAUGH Rotary Measureing Faucet. very extensivly used.
CARPET RAG LOOPER-- A little device by which rags are looped quick and firm, without Needle or Thread.
ELLECTRIC CLOCK.

MAGNETO ELECTRIC MACHINE,

For short line Telegraphing. Fire Alarm, and Propelling Electric Clocks. It can be applied to any form of Electric movement. Gives entire satisfaction USEING NO *GALVANIC BATTERY.*

☞ **For SIMPLICITY it has NO RIVAL.**

That is the story which he told in print, in the summer or fall of 1874, and again in 1875 or 1876. How many recollections, how much oral testimony, does it need to satisfy the Court beyond any possible doubt, that six years or eight years before that, the speaking telephone was the greatest ambition of his heart, made, completed, working successfully, not kept concealed, shown designedly to everybody; in the language of the answer, "freely communicated to the public," and left out of that list! Was it poverty that would account for the printing of that list *with the telephone left out*, if he had one? That list is a list of his inventions. It says on the other side "Patents"; which means a patent in the same sense as a paragraph which I read from the newspaper this morning, and in which it is frequently used in this record. It is a list of his inventions. Only about one half of the things in that list were patented. He was not manufacturing them; he did not own those patents, he had sold them; it was a list of inventions, a list of contrivances which he published to the world in order to show to the world the scope of his genius — if he had any, whether he had a right to advertise himself as an "INVENTOR"; and he left out the telephone — if he had one.

Well, may it please your Honor, after that I want to show the instruments. While the instruments are being brought out, I may as well state one fact, which will be shown more fully hereafter. In 1867, his partners in business fitted up an expensive machine shop in his village at a cost of about $20,000; it was run by water power. From that time he has had the right to occupy that shop and use that machinery rent free, and has done so.

I ought to say that the plan which I have marked out for myself is not so much to comment on specific facts which are disputed on the one side or the other, as it is to array before your Honor the history of this man, — incontrovertible facts, drawn from the papers or drawn from his own depositions, leaving to your Honor, without comment or argument from me, to judge of the weight and value of the facts upon the main question of the case.

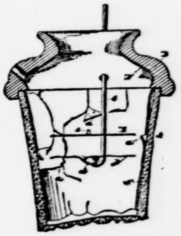
The defendants, at the outset, recognize that the fact that he never put an instrument into use, and never went to the Patent Office, is a fact, or a set of facts, which goes very much against the belief that he had an instrument fit to be put into use, or to be carried to the Patent Office. They therefore seek to bridge over this chasm by these allegations (and it is the only explanation by which they try to bridge it over) of want of tools, want of money, want of resources. In the first place, as I have already stated, so far as want of money goes, we shall presently show that it is not true, according to his own deposition. If that were the excuse, it would not meet the circumstances of the case; it does not meet, for example, the allegation that he had made a perfectly good telephone, but could not make one more pair to put into use; it does not meet the fact that in printing this card, he gave a list of sixteen inventions, and did not mention a telephone. It does not meet a good many other facts.

Upon the question of tools, I was going to say that in the spring or summer of 1867, his partners embarking in business with him upon an invention which he had made and just patented, furnished a machine shop in his own village with $15,000 or $20,000 worth of machinery and put him in charge of it; and that machinery, though changed from time to time, substantially remained there down to the time when this controversy began. He had the free use of that machinery, driven by water power, without rent; the machine shop and the use of a private room for himself, from that time for thirteen years after he began, without any rent. Now when you find that fact in his own deposition, with no controversy about it; when you find the fact announced on that card, that he not only made models, but especially made electrical machines, there is an end of all pretence about want of tools — except the effect which this proof has on the men who swore to such a pretence.

The instruments produced by the defendants as exhibits are now placed on the desk before your Honor. Here, on this side, are the instruments, or the remains of the instruments, which they allege were made *before* the date of the Bell patent (March 7, 1876) and in the following order: **F**, the remains of a broken tumbler; **B**, the remains of what we call the tin-can instrument; **C**, the remains of a sort of breastwork instrument, something like the top-sides of a ship; **I**, the remains of an instrument something like a cuspidor; **A**, this round, flat instrument with a brass bracket at the back carrying the magnet and a mouthpiece near one edge of the flat side; then these two small magneto intruments **D** and **E**.

On the other side of the desk are certain exhibits alleged to have been made *after* the date of the Bell patent (March 7, 1876), **L** and **M**, which are about alike; **G** and **O**, which are about alike; **H**, which is the large tall instrument with a sloping front and a bell on top; **N** and **Q**, small magneto instruments; **J**, which is a large instrument in an oblong box; **P**, which is a shield-shaped board, with a long rubber tube ending in a mouthpiece, coming from it near one edge, and a short wooden tube and mouthpiece about an inch long near the other edge of it; then **K**, this small round black-walnut instrument, with a little brass handle projecting from one side.

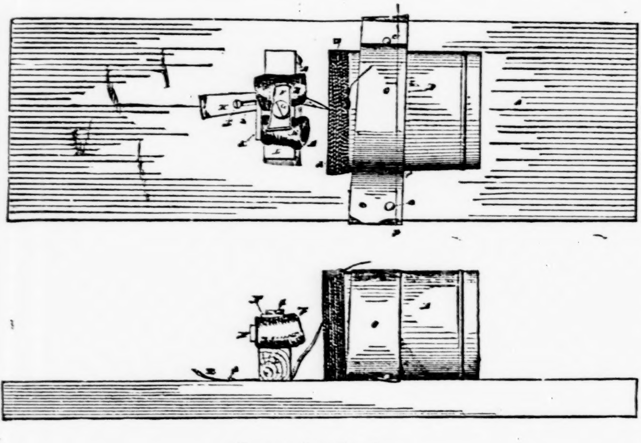
The allegation of the defendants is that **F** and **B** are the earliest in date of these. **F**, the broken tumbler, is alleged to have been a transmitter, and **B**, the tin-can instrument, is alleged to have been a receiver. Your Honor appreciates that it requires two instruments to make a telephone, properly so called; that is to say, the apparatus which is to transmit speech must have a transmitter at one end, a receiver at the listening station, and a line wire to connect the two. The defendants' story is that the first apparatus among all those produced consisted of **F**, the tumbler, at the transmitting end, and **B**, the tin can, at the receiving end. The tumbler **F** is alleged to have been a variable-resistance battery transmitter; that is, one in which the motion given to the diaphragm by the voice, served to vary the resistance of a circuit through which a battery current was passing, and thus produced undulations in the current, in the manner which I described this forenoon. It is not alleged that it had *hard* contact pieces. The construction which they allege for it was different from anything I have described, but it is alleged to have been a battery instrument which operated by varying the resistance of the circuit. This broken-tumbler instrument is a wreck, as you see. It is alleged that the instrument was either made out of a broken tumbler, or that the tumbler was broken soon after, and used in that condition ever afterwards; that it had a diaphragm of bladder tied over the top of the tumbler; that to that non-existing diaphragm there was attached a wire, not now in existence, which, it is said, ran down to this plate which appears



F, one fourth size.

as the upper plate in the cut. It is alleged also that the stiff brass wire which goes through the cap piece, and carries a plate about as big as a quarter-dollar, at its lower end, had a box around that plate, containing some powder of some kind. You see that this instrument is not only not a speaking telephone now, but it has not the parts which are essential to enable it to transmit any sound, if it was ever made as they allege. The construction of the original instrument must therefore rest on memory.

This tin-can instrument **B** is alleged to have had a bladder tied over the end of the can, where you still see the remains of a bladder.

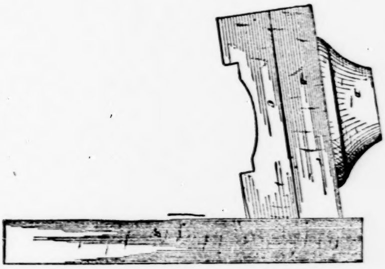


B, one fourth size.

It is alleged that to this non-existing bladder there was secured near its centre a piece of iron as an armature, which also does not now exist; that in front of that armature, and substantially in its present position, was arranged on a wooden block an electro-magnet. It is said that the one now on it was one that was used on it at a certain period, not the only one that was used on it — so they say. When the undulatory current produced by any proper transmitter comes to such an electro-magnet as this, it passes through the coils around the iron horseshoe and by its varying strength varies the magnetism of the cores, and the horseshoe thus attracts the armature more or less; and this alternately pulls in the diaphragm and allows it to retreat, moving it, vibrating it, as I explained this morning in the case of another receiver. It is alleged that this was so arranged and contrived as to act that way.

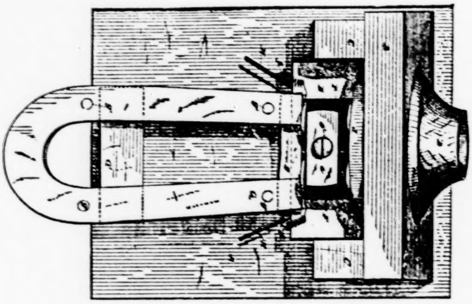
F, the broken tumbler, is alleged to have been a transmitter, and **B** is alleged to have been a receiver; and it is said that these two were made to be used together as the first set of which any remains existed. It is alleged that they were made in 1867; indeed, one of the witnesses, Snell (defts, iii, 412), says that he listened at **B** in the first half of 1867. The defendants have made what they call reproductions of these. I shall by and by show that what still exists in these exhibits shows that the originals never could have been like those so-called reproductions. Here are the so-called reproductions on the clerk's desk, marked "F reproduced" and "B reproduced."

The defendants say that the next pair which Drawbaugh made were the breastwork instrument **C** and the cuspidor instrument **I**. The breastwork instrument **C** lacks operative parts: here is a mouthpiece; here is now on it a diaphragm; it is alleged that in front of, or perhaps I should say, behind that diaphragm there was placed an electro-magnet, and behind that a large heavy horseshoe magnet, the poles of which were in contact with the cores of the electro-magnet. If it were so constructed, it would, in theory be capable of operating after the manner of a magneto receiver or of a magneto transmitter. This instrument on the clerk's desk is alleged to be a reproduction of it, with the parts of the reproduction which are not in this exhibit **C** supplied from somebody's memory.



C, one fourth size.

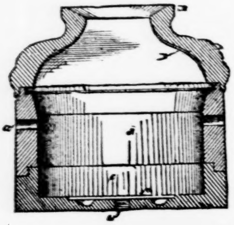
The Court perceives that this so-called reproduction is of the same character as the magneto instrument I described this morning. It has a diaphragm supported at its edges; in front of that an electro-magnet with soft iron cores, and still in front of that a heavy permanent horseshoe magnet. When the latter is placed in contact with the cores of the electro-magnet, its magnetism, so to speak, flows into the cores of the electro-magnet, and the latter become magnetized for the time being; and therefore it can operate either as a transmitter or a receiver in the way I described this morning.



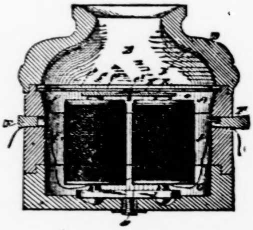
" C reproduced," one fourth size.

This cuspidor-shaped instrument I, when produced and sworn to in this case by the earlier witnesses, consisted of nothing but the walnut shell; it had no inside works at all.

The defendants have since taken the liberty to place in it a diaphragm while the testimony was in progress, which was not in the original; they have also placed in it a magnet which they say they



I, one fourth size.

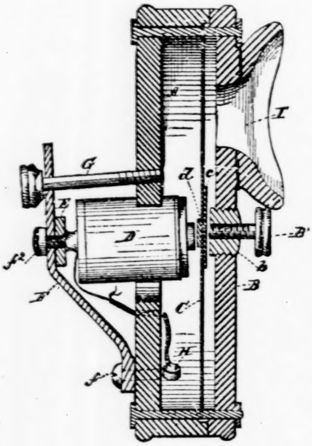


" I reproduced."

found in Drawbaugh's garret, and which they conjecture may have been used in it before, because they say it fits, though really it does not. It is worth noticing that the witnesses who pretend to identify this instrument swore to it just as freely when it was a mere shell as they did afterwards when the works were placed in it; and they have since identified it as positively as they do any instrument, although the diaphragm of it — one of the essential operative parts —has been made, constructed and placed there since we began to take testimony. All these witnesses are perfectly ignorant men, and know nothing except the looks of the outside of the box, even if they do that.

It is obvious therefore that any knowledge which the Court may have of the interior of these instruments, that is, of parts which are not found in these wrecks, must rest on Drawbaugh's memory alone, with perhaps some little help in some particulars from some of the witnesses.

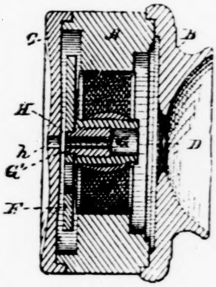
This instrument **I**, as it is found here, contains inside simply an electro-magnet with unmagnetic or, as we call them, neutral cores. It is alleged by the defendants that after a time Drawbaugh took out that electro-magnet and placed in it a somewhat smaller one, with a pair of horseshoe magnets at its back end to magnetize its cores. In that condition, when the cores were magnetized it would become a better receiver, — I speak to you of its theoretical operation, not whether it is good enough to work, — and could also theoretically be used as a magneto transmitter, generating currents by the vibration of an armature carried on the diaphragm in front of an electro-magnet in the way I described this morning. It is alleged that these instruments — **C** and **I** — were made about 1869 or 1870; that **C** was made a few months before **I**; that each of them were made with neutral electro-magnets merely, to begin with, and that afterwards the permament horseshoe magnets were added as an afterthought. The addition of permanent horseshoe magnets to such an instrument constitutes an important improvement; it is one of those covered by Mr. Bell's second patent; it does not change the nature of the operation, but it improves the instrument.



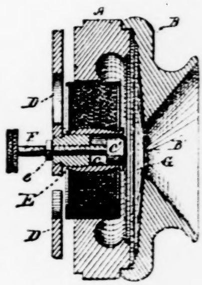
A, one half size.

The black-walnut instrument **A** is alleged to be the next in order. It is the round, flat, rather thin instrument, about five inches in diameter and an inch and a quarter thick, with a brass bracket at the back carrying an electro-magnet, and an oval shaped mouth piece near the edge on the opposite side. It is not worth while to take it apart; there are some illustrations of it in the book, which your Honor can examine. The Court will see the long black line C, which is a diaphragm. The diaphragm is of wood, which of course is no more a magnetic material than bladder; but fastened to the centre of that diaphragm is a piece of iron, *d*, to serve as an armature. This instrument is a receiver only, because, as the electro-magnet has neutral cores, the vibration of an armature in front of them will not generate magneto currents. When from a proper transmitter the undulatory articulating current reaches this electro-magnet of **A**, and passes through these coils, the magnetism of this core is altered in accordance with the variations of the current, and the diaphragm is correspondingly vibrated; and when the earpiece is placed to the listener's ear, he will hear a corresponding sound. That, I say, is the theoretical operation of the instrument; and in point of fact, with a good transmitter, this instrument makes a very respectable receiver; it is in fair working condition, and is good enough to be practically used for that purpose if there were no better instrument. It is an instrument, however, which requires a battery; you cannot use it in connection with a mere magneto transmitter; and the allegation for the defence is that it was used as a receiver with **F**, — the broken-tumbler instrument as a transmitter. Drawbaugh's story is that it was not so good an instrument as **I**. The Court will see that its workmanship is quite neat and nice. It is alleged that this instrument — as I understand it — was made in the fall of 1874.

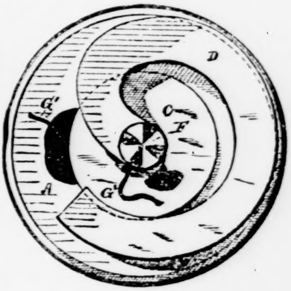
Next comes this pair of instruments **D** and **E**, small magneto instruments.



E, section.



D, section.
One half size.



D, rear view.

They are substantially, alike. I may say, exactly alike; the only difference is a slight change which was made in one of them in the interior cavity of the wooden case, which obviously would be, and which Drawbaugh says he found to be, no improvement and no injury: it was quite immaterial. **E** has a wooden bottom or cover you will see on the back; **D** has none; evidently from the rabbet in the wood there was one and it has been lost; its loss exposes to view the rather peculiarly shaped "curled magnet," as it is called, in the case, in the form of a snail. The instrument **E** contains just such a magnet arranged in just the same way, but it is covered by the wooden bottom or cover. These are very highly organized instruments, and their workmanship shows that the man who made them was a neat mechanic.

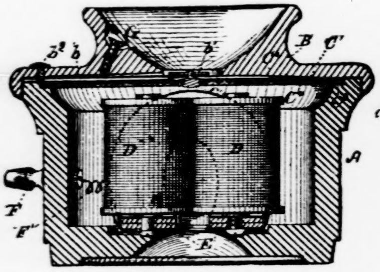
I will enumerate some of the details of these two instruments. The Court will remember that the magnetic changes which are essential to the transmission of speech take place not far from 2,000 times a second, that being somewhere about the period of duration of a vibration due to what are called the "overtones," and upon which the quality of the sound, that is, the distinction between one word and another, depends. It is obvious that the instrument, in order to respond to these slight and rapid movements, must be able to change its magnetic condition with the utmost rapidity. It is found that a very short core with a coil, short but large in diameter, was for this reason more effective than the long and large electro-magnets commonly used up to that time in telegraph instruments. It was also found that a magnet applied to the rear end of the core, I mean a permanent steel magnet which thus kept the core constantly magnetized, increased the excellence of the instrument, because under such conditions the core and the diaphragm are more sensitive and quick to respond to small and rapid changes. This instrument has a metal diaphragm which is much better than a bladder. Your Honor will recognize also the form of this mouthpiece. In the broken-tumbler instrument **F**, and in the instrument **C**, and in the cuspidor instrument **I**, and the tin-can instrument **B**, there was a great cavernous space between the exterior air and the place where the diaphragm is alleged to have been — a cavity.

In these instruments, **D** and **E**, you see the small flaring mouthpiece with the rather small hole in its centre, which opens into a cavity of the full diameter of the diaphragm, extremely thin, — the sixteenth of an inch or thereabouts. I take off the cover to show the interior of this mouthpiece, and you see that it is exactly the same as that of the ordinary commercial instruments which I showed you this morning. This thin air space and central opening — we are not quite sure exactly why — are great improvements over the large cavernous space of such an instrument as **C**, for example; and since Mr. Bell invented it, this has been universally used in all telephones everywhere. These niceties of detail, to wit, the short core and coil, the permanent magnet on its rear end, the metal diaphragm, peculiarly shaped mouthpiece and air space, are great improvements; they betoken an advanced state of the art; they are covered by Mr. Bell's second patent. In practice, Mr. Bell found, after a while, that he could carry these forms to a great excess with advantage, and the forms in commercial use exhibit these features in a very marked degree. Experience showed just how far he could carry these improvements and gain. These two instruments, **D** and **E**, contain all of them; they are refinements which come from a high state of the art; and whoever first made the instruments with all these little refinements had got a good ways along in the art, — must have had a long and varied experience with many instruments, — in fact, so far along that the best modern receivers of to-day contain no feature which is not in these two instruments. I ought to qualify that a little. These two instruments D and E are weak. It is essential that the core of soft iron should be highly magnetized, as nearly saturated as possible, with as much magnetism as you can get into it.

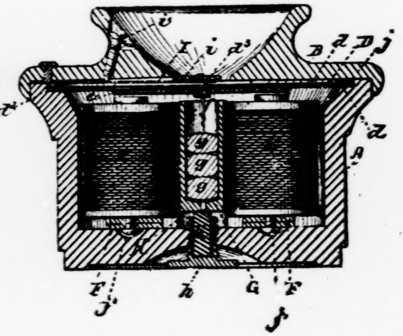
Now, if you attach a very large steel magnet to a very small core, there is magnetism enough in the large mass to flow into the small, soft iron core, and, so to speak, fill it; but if you apply a large core of neutral soft iron to a very small steel magnet, the magnetism will, to use an expression picturesque rather than scientific, be so diluted in the attempt to fill the large core, or, rather, so insufficient in amount to fill and saturate it, that the contrivance will be weakly magnetized. This core that I speak of is inside the coil. It is a small piece of soft iron, perhaps a quarter of an inch in diameter and an inch long. Now the defect I have spoken of, that is, the smallness of the permanent magnet, which you will see is not more than one sixth as large as that of the commercial telephone, makes these instruments weak; but it would not prevent their talking well enough to be heard on a short line. The defect is one in proportion but not in principle.

These are all the instruments which they allege were made before the date of the Bell patent (March 7, 1876). They are described at length in the brief, pp. 136–144.

The defendants' allegation is that L and M were made after the Bell patent; then G and O, then H, then J, N, Q, P, K. L and M are magneto instruments to-day; they do not differ in principle from D and E; I should say that they were a step backward from D and E. They have the metal diaphragm and the thin air space and a mouthpiece as in D and E, but they use two cores, that is, a horseshoe magnet instead of a single core, which experience has shown to be not quite so good; they have larger electro-magnets, which experience has shown to be not quite so good, and the permanent magnets which are to magnetize these much larger cores are very little larger, though somewhat, than in D and E. That is what the instruments are to-day; when they came into this condition is another question. The defendants' story is that L and M originally were in a different condition; that when first made these two magnets of **L** and **M** inside were farther apart, and between them was placed a microphone, just such a microphone as is now in **G**, so they say. Their drawing "**L** reproduced" shows the condition in which they say these instruments **L** and **M** were first made.



L, one fourth size.

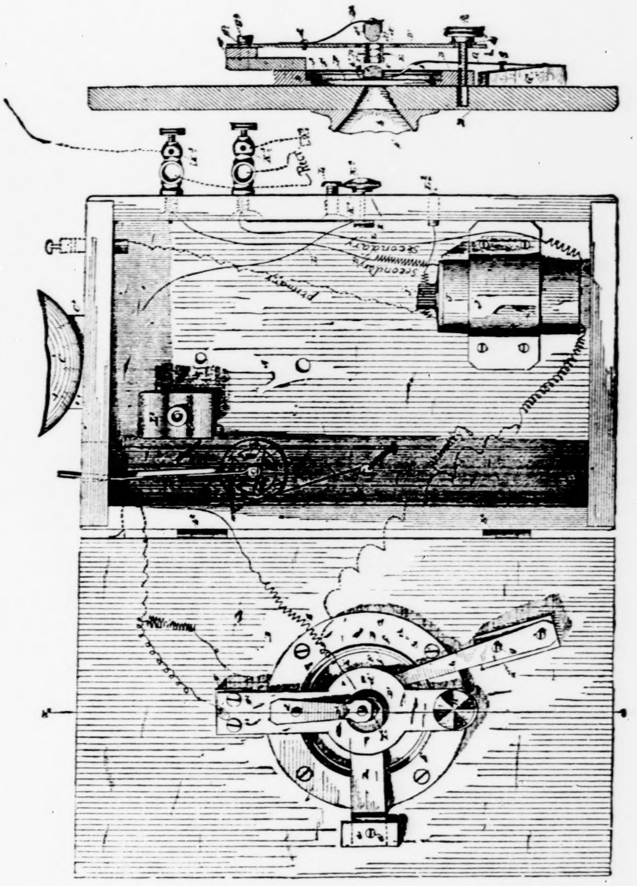


"**L** reproduced."

This microphone arrangement consists of a small wooden tube perhaps a quarter of an inch in diameter. In it are placed two or three carbon balls; in fact, they are flattened down a little like a lentil. One of them, nearest the diaphragm, is connected with it in such a way that the diaphragm as it vibrates presses more or less on that; the rear one rests against the body of the frame which carries the edges of the diaphragm. Thus, when the diaphragm vibrates, it presses these carbon balls more or less together in the way I have described to you about the microphone this morning; and a battery current flowing through them experiences the varying resistance and is thrown into electric undulations similar in form to the sound waves; that is to say, such is the theoretical operation of the contrivances.

I said that the rear carbon ball farthest from the diaphragm was supported on the frame of the instrument, but between the frame and that rear block is placed a spring, either of metal or rubber, and an adjusting screw; the object of the adjusting screw is to secure exactly the right initial or normal pressure, a thing quite indispensable to make such an apparatus work at all, while the effect of the spring is to enable variations of pressure to be produced with less liability to break the contact and interrupt the current, — a disaster which, as I have described this morning, is for the time being fatal to the transmission of speech.

Of all materials which have ever been used for microphone contacts, it is found that hard gas carbon, smoothed, and either alone



or in contact with platinum, one or both of the surfaces being rounded, is the best as material and as form; and it is found that a spring backing and an adjusting screw are practically necessary to reach good results in nearly all microphone instruments of this type.

These features are found in G, and are alleged to have been found in L when it contained the microphone. G and O and L and M, therefore, were very highly organized instruments, with many of the best modern refinements. They lack, however, one feature, which is very important, and which I have already spoken of, and that is, a weight attached to the back electrode. Still, G is an instrument which can be practically used in really skilful hands. The Court sees that it is a very neatly made instrument; there is in it not only good workmanship, but its shape and arrangement indicate a nice, and I may say a very fastidious workman; it is rather graceful, and considerable pains have been taken to give it an ornamental shape.

The next instrument in the defendants' chronological schedule is this tall large instrument with a sloping front and a bell on top, H. It is a microphone, but of a very highly organized character. It has a wooden tube with some carbon balls inside of it as G had, but the outer carbon, D^2, instead of being arranged with a small screw and rubber block to press it up, is carried on a long and delicate brass spring, which itself is carried on a long lever held at one end on an ear-piece which projects out from the iron ring, and furnished on the other with an adjusting screw. That arrangement enables a very nice adjustment to be secured and great delicacy of contact obtained.

The diaphragm is carried on this cast-iron ring, which itself is screwed to the cover of the box, which the Court sees when I shut the box; and a section in the drawing shows it also. The cover of the box has a mouthpiece terminating in a small central opening which leads into the large and thin air space like that already described in other instruments. On the inside of the cover also is this long finger-shaped spring of steel screwed to the cover of the box, with the free end of it pressing against the diaphragm near the centre. Its function is said to be to "dampen" the diaphragm. It is desirable to have this done, though not very important. Inside of the box in this little tin can is what is called an induction coil. It is not necessary for me to describe that, but it is a contrivance which, while it does not change the nature of the operation performed by a microphone transmitter, greatly increases its range and power when it is desired to use it over a line of any considerable length.

I open and place alongside of it the Blake transmitter, which I described this morning. Every feature which your Honor can see in the Blake transmitter is found in Drawbaugh's instrument **H**. Even the details of the structure — the way the things are mounted — are the same in both. The diaphragm of each is carried in a cast-iron ring, secured to the swinging door of the box; the mouthpiece is formed in that wooden door; there is a spring firmly pressing against the diaphragm; the back electrode, or anvil electrode as we sometimes call it,— this rounded piece of carbon,— is carried in a little brass cup piece which itself is fastened at the end of a delicate spring, the other end of which is attached to the long swinging lever fastened by a spring, hinged at one end and provided with an adjusting screw at the other. The induction coil is arranged inside the body of the box. The resemblance, as your Honor now sees it, is perfect.

They are different in size and there are some little differences in the details, but if a good workman had seen one without taking it to pieces, but merely looking at it for a few minutes, he could and naturally would be able to go home and make the other. But there are two things which are in the Blake transmitter and are not in Drawbaugh's instrument **H**, and they are the most valuable things in the instrument. When I described the Blake transmitter this morning (p. 27, *supra*), I pointed out that the variations of pressure which caused the variations of current were due to the fact that the quick-moving diaphragm pressed against the weight of this back electrode, or anvil electrode *c* as we sometimes call it, and that owing to the inertia due to the weight of the latter, its indisposition to get out of the way quite as quick as the diaphragm pushes it, pressure is developed at the point of contact; and it is that very pressure which makes the instrument a transmitter. To make it work well that way, it is essential that the anvil electrode should have a certain weight. The pressure of a spring will not take the place of a weight; and the excellence of the Blake transmitter is very largely due to the presence of that weight. The thing can be made to talk without it, but not with any degree of satisfaction; if the weight is not there, the slightest change in the volume of the voice makes the thing break, and it ceases to talk intelligibly. In the Blake transmitter you see that the delicate spring which carries the back electrode is one which ends in a brass cup about half an inch in diameter, carrying on its face towards the diaphragm the black piece, which is polished gas carbon; it is weighted; it has lead or something inside of it and weighs about seventy-five grains. In Drawbaugh's instrument H, the back carbon d^3 is also carried in a brass cup d^2, carried on the end of a similar long and rather delicate spring D^2, *but the weight is left out.* All that one can *see* in looking at that part of the Blake, even to the manner and material for holding the carbon, is in Drawbaugh's instrument, *but the weight, which is the soul of the whole, is left out.* You cannot see that; you see the outside of the brass cup, and you do not know, unless you have studied the instrument and really understand such things, that it is weighted.

Again, look at the spring finger which presses against the diaphragm. That is in both instruments. In making the Blake transmitter, Mr. Blake discovered that it was a great advantage to have the diaphragm free and untrammelled at its edges. In the earlier instruments of other constructors, the diaphragm was screwed hard to the frame. Mr. Blake found that it was better to rest it simply in a recess and hold it in place by a spring finger. I do not think your Honor noticed that when I showed you the Blake transmitter. You saw the cast iron frame, you saw the diaphragm supported by it, and you saw the spring finger, but you did not see that the diaphragm was loose and supported only by the spring finger, nor understand that that arrangement is the real reason for having the spring finger there and its chief advantage. Now what your Honor noticed this morning in the Blake transmitter in that respect is exactly what you find in Drawbaugh's instrument H, and what is in the Blake, but passed unnoticed, is not in Drawbaugh's H. He has got the diaphragm supported in the cast-iron ring; and he has this long steel spring finger pressing against it; but he has his diaphragm *rigidly attached to the cast iron by this brass wire and these screws.* He has got the finger there, but it is not doing the chief work for which Mr. Blake invented it.

If Drawbaugh *saw* a Blake transmitter, and went home and tried to copy it, he would have put into it exactly what he has got in H, and he would have left out exactly what he has left out of **H**. He has put in what he could see, and he has left out that which was covered up. In our testimony, Professor Cross described the Blake transmitter. Mr. Benjamin, the defendants' expert, points out (defts, ii, 1262, at the bottom of page, and at the top of page 1263) that Mr. Cross's description of the Blake transmitter is correct, and says, "*Take the word 'weighted' out of that quotation*, and it correctly describes the carbon-holding arrangement in Drawbaugh's instrument **H**"; and then he points out that Drawbaugh's instrument **H** and the Blake transmitter are identical even to the form and details of structure. Can anything be more significant than this?

The defendants allege that this instrument **H** was completed in August or September, 1876, and that **L** and **M** and **G** and **O** were made a few months before it.

These microphones **L**, **M**, **G**, **O**, **H**, and the alleged subsequent instruments, are considered in the brief, pp. 182–190.

So that their allegation is that, during the summer of 1876, at the time of the Centennial Exhibition, Drawbaugh had these instruments. He says that he has made since then three instruments, with some modifications which are not material for me to examine, because they introduce no new principle, merely some variations of detail. I refer to **J**, which consists merely of two such contrivances as **H**, still without the weight, mounted on one diaphragm; **N**, which is virtually a cross between **L** and **D**; **P**, which is merely two instruments nailed to one back board; and **K**, substantially copied from Edison, but never finished, because Drawbaugh could not make it work.

As I read Drawbaugh's testimony, he does not claim that any instrument which he made after **H** (whenever that was) was even quite as good, or certainly not materially better, than this Blake transmitter **H**. He reached the high-water mark in the summer or early fall of 1876, if his story be true. If his story be true, he had in this instrument then existing substantially all that the world now has, *except that weight back of the carbon contact and the free diaphragm;* all the improvements the four years of invention since then have put into the commercial instrument he had got in that summer, and that was the summer when Mr. Bell became famous by his exhibition of thing break, and it ceases to talk intelligibly. In the Blake transmitter you see that the delicate spring which carries the back electrode is one which ends in a brass cup about half an inch in diameter, carrying on its face towards the diaphragm the black piece, which is polished gas carbon; it is weighted; it has lead or something inside of it and weighs about seventy-five grains. In Drawbaugh's instrument **H**, the back carbon d^3 is also carried in a brass cup d^2, carried on the end of a similar long and rather delicate spring D^2, *but the weight is left out*. All that one can *see* in looking at that part of the Blake, even to the manner and material for holding the carbon, is in Drawbaugh's instrument, *but the weight, which is the soul of the whole, is left out*. You cannot see that; you see the outside of the brass cup, and you do not know, unless you have studied the instrument and really understand such things, that it is weighted.

Again, look at the spring finger which presses against the diaphragm. That is in both instruments. In making the Blake transmitter, Mr. Blake discovered that it was a great advantage to have the diaphragm free and untrammelled at its edges. In the earlier instruments of other constructors, the diaphragm was screwed hard to the frame. Mr. Blake found that it was better to rest it simply in a recess and hold it in place by a spring finger. I do not think your Honor noticed that when I showed you the Blake transmitter. You saw the cast iron frame, you saw the diaphragm supported by it, and you saw the spring finger, but you did not see that the diaphragm was loose and supported only by the spring finger, nor understand that that arrangement is the real reason for having the spring finger there and its chief advantage. Now what your Honor noticed this morning in the Blake transmitter in that respect is exactly what you find in Drawbaugh's instrument **H**, and what is in the Blake, but passed unnoticed, is not in Drawbaugh's **H**. He has got the diaphragm supported in the cast-iron ring; and he has this long steel spring finger pressing against it; but he has his diaphragm *rigidly attached to the cast iron by this brass wire and these screws*. He has got the finger there, but it is not doing the chief work for which Mr. Blake invented it.

If Drawbaugh *saw* a Blake transmitter, and went home and tried to copy it, he would have put into it exactly what he has got in **H**, and he would have left out exactly what he has left out of **H**. He has put in what he could see, and he has left out that which was covered up. In our testimony, Professor Cross described the Blake transmitter. Mr. Benjamin, the defendants' expert, points out (defts, ii, 1262, at the bottom of page, and at the top of page 1263) that Mr. Cross's description of the Blake transmitter is correct, and says, "*Take the word 'weighted' out of that quotation*, and it correctly describes the carbon-holding arrangement in Drawbaugh's instrument **H**"; and then he points out that Drawbaugh's instrument **H** and the Blake transmitter are identical even to the form and details of structure. Can anything be more significant than this?

The defendants allege that this instrument **H** was completed in August or September, 1876, and that **L** and **M** and **G** and **O** were made a few months before it.

These microphones **L**, **M**, **G**, **O**, **H**, and the alleged subsequent instruments, are considered in the brief, pp. 182–190.

So that their allegation is that, during the summer of 1876, at the time of the Centennial Exhibition, Drawbaugh had these instruments. He says that he has made since then three instruments, with some modifications which are not material for me to examine, because they introduce no new principle, merely some variations of detail. I refer to **J**, which consists merely of two such contrivances as **H**, still without the weight, mounted on one diaphragm; **N**, which is virtually a cross between **L** and **D**; **P**, which is merely two instruments nailed to one back board; and **K**, substantially copied from Edison, but never finished, because Drawbaugh could not make it work.

As I read Drawbaugh's testimony, he does not claim that any instrument which he made after **H** (whenever that was) was even quite as good, or certainly not materially better, than this Blake transmitter **H**. He reached the high-water mark in the summer or early fall of 1876, if his story be true. If his story be true, he had in this instrument then existing substantially all that the world now has, *except that weight back of the carbon contact and the free diaphragm;* all the improvements the four years of invention since then have put into the commercial instrument he had got in that summer, and that was the summer when Mr. Bell became famous by his exhibition of the telephone at the Centennial. He had got in that summer (although not before Mr. Bell's patent) everything that the community has since commercially used.

The COURT. Before his first patent?

Mr. STORROW. Before his second patent, not before his first.

Now I want to make some observations on these instruments. If these instruments could speak and tell us their date, if their dates were burned into them by nature so that they could not be falsified, how this case would be simplified!

To prove the dates of these instruments, the defendants depend upon recollections and nothing else; the dates rest upon men who say that they recollect that at a certain time they saw these instruments or listened at some of these instruments. There is not a piece of paper which connects Drawbaugh's name with the telephone before 1878; and by and by your Honor will read those papers of 1878. Everything on the part of the defendants depends upon recollection. I do not mean to say that there is not some attempt to create an appearance of something better. A man says that he recollects that he saw a particular instrument while he lived in a particular house, or when he raised potatoes in a particular field, or when he made cider. He has got the deed to show when he bought the farm where he raised the potatoes.

But these are mere efforts of memory, — memory in some form or other is the link and chain on which they have to rest their claims.

But these machines, although they cannot tell us their date, do tell us something else which will help us. Look at these two instruments **L** and **M**; look at that microphone **G**. This man was a very nice, skilful mechanic. No man can doubt it. He not only was a good workman, but a fastidious workman. That instrument **G** was not made for sale; it was not offered for sale; but was made for his own private gratification. It is not only a well-made instrument, but tastefully made and fastidiously made.

Look at this, the broken glass tumbler **F**. Some of the defendants' witnesses say that the instrument was made of a broken tumbler, and some that the tumbler was broken soon afterwards. It is impossible to believe that a man who could make that instrument, the finished one **G**, would be contented with such an instrument as that, the broken glass tumbler **F**, as the representative of his speaking telephone, without making something better, when he got any results. It is at most but one or two days' labor to make this more perfect instrument.

And now, in the first place, they say that throughout this whole time, from 1864 or 1865 down to the time when this controversy began, he believed (that is the allegation) and told his neighbors — his neighbors come and say so — that the speaking telephone was the greatest invention he had ever made, that there was a fortune in it. Undoubtedly neither he nor anybody recognized all the value of it as it has since come out. But they say that *he* recognized it and told others that *he* recognized it, and his neighbors, called by him, say that *they* thought if he could complete it, that there would be a fortune in it, and that it would be the greatest invention of the time, and would supersede the telegraph and everything of that kind. The quotations from their record to this effect are collected in our brief, pp. 79–86.

I hold it to be perfectly certain that a workman with the skill that could produce that one (**G**), would not have kept this pair, — the broken tumbler **F** and the tin can **B**, — as the only pair for a week, *if he ever got results which he fancied would entitle him to call it a speaking telephone.*

Now, the story is that these instruments talked so well in 1867, 1868 and 1869 or thereabouts, that they transmitted whole sentences and newspaper advertisements.

Well, if that be true, they might be kept as precious relics of the past; but they would at once have been banished from the scene of action by better structures; yet the defendants have brought witnesses who swear to the actual use of that pair of instruments — the broken tumbler and tin can — for nearly nine years, until after the date of the Bell patent; that is, they have got witnesses in their record who swear that these were used in 1874, 1875 and 1876. That is a pretty hard thing to believe of any one, still more of such a workman, — a professed maker of electrical apparatus.

Well, we go back a little further in the deposition of Mr. Drawbaugh, and see what he has got to say about it. His story is that this pair of instruments, **C** and **I**, or the originals of which these are the remains, were made after **F** and **B**, and were much better than **F** and **B**, gave better results, better speech, every way better. Brief, pp. 150, 152 *et seq.*

Can you account for it, that after he got that pair (**C**, **I**), which gave much better results than these, that he should have gone on using these (**F** and , the tumbler and tin can) to gratify the curiosity of strangers — mere farmers and farm laborers and loafers, who came in there from habit or curiosity — when he had better?

Not only that, but these instruments **C** and **I** they allege were instruments which from their construction required no battery, required no troublesome adjustment; arranged once, they never required change; but these, **F** and **B**, if made as alleged required the most difficult and careful readjustment almost from moment to moment, from word to word, if they could talk at all.

Now, is it not incomprehensible (with that allegation in their record about the relative merits of these instruments, which is their story) that he should have gone on using these, **F** and **B**, for years and years and years, showing them to chance outsiders, and that he never showed those more perfect ones once. I won't say that he never showed them once; there are two witnesses, possibly three, in this record, out of three hundred and sixty-six witnesses, who say that they saw those improved instruments **C** and **I**. There are only two who pretend to have used them down to 1876, — two witnesses, possibly three, — and yet they swear to continued use of **F** and **B** all that time.

That is not all. Suppose that he had in the tumbler **F** a variable-resistance battery transmitter. He then makes **C** and **I** and **D** and **E**, two sets of apparatus, in each of which the transmitter is a magneto transmitter. It is thinkable that he might still wish to experiment with a battery transmitter. Their story is, that **F** was made in 1867; some of their own witnesses swear that it was in daily use in 1876, and in every year between. Even if he wanted to experiment with a battery transmitter, it is not within the limits of possibility that so good a workman would have continued to use **F** as his sole battery transmitter for nine years. Yet the story is, and the defendants' depositions (if you believe them) are, that he had no other for nine years, and then suddenly jumped to the refined instrument G.

Nor is this all. If you can conceive that he should continue to use the tumbler F, still that requires a receiver to be connected with it. They say that the tin can B with a bladder was made to go with it in 1867. In 1869 and 1870, he made, so they say, the magneto instruments C and I, each with metal diaphragms. Each of them was a receiver; each was a receiver better than B, he says. He says that I was the best receiver he made until he made D and E, alleged to have been in 1875. He says that he used C as a receiver connected with F as a transmitter, and that he used I as a receiver connected with F as a transmitter, and that each of these gave better — far better — results than the tin can B did when used with the same transmitter F. Now if he were experimenting with F, or if he were exhibiting to idle visitors what could be done, and wanted to use F, he would certainly use his best receiver. Yet their own witnesses swear that he used the tin can B in 1876, after the date of the Bell patent, and not a single witness for the defence (except the claimant Drawbaugh) pretends even to have witnessed any use of I with F.

But the proof does not stop here. Drawbaugh swears in his deposition that, in point of fact, after he got the alleged later and better ones, C and I and A and D and E, he did not use the tin-can and bladder instrument B. He says that not long after he made C, — a year or two perhaps, — that one, B, the tin can, went to the garret, and the mice ate off the membrane, — the diaphragm, — and he never put on another. The shop was an old clover mill, and was overrun with mice; and that is what became of the membrane. (Brief, p. 154.)

I am going a little further into this matter. Here are instruments A, D and E, a great deal nicer than F or B or C or I. Not perfect instruments, but good enough for commercial and practical uses. Is it thinkable that when he used a telephone merely to gratify the curiosity of farmers, or when exhibiting one under circumstances that required him to produce his best, as, for example, when he had a man there whom he says he wished to induce to invest money in this invention, that he would not have produced his best instrument? Is it conceivable that having much better instruments, he should still use these, tumbler **F** and tin can **B**, or either, when it was desirable to make the best impression, and show the best that his instrument could do? Not only is it not conceivable, but it disproves itself.

Indeed, he swears that when he made his next pair, after **F** and **B**, or not a long time after that, **F** also, as well as **B**, went to the garret, and was destroyed by the mice. (Brief, pp. 154-5.)

Now when we find that at a certain period his own witnesses say that he was using the tumbler and tin can for examples, we *know* that there was then no better one in existence; we know that this particular receiver, the tin can **B**, used at any particular time, displaces these better ones, disproves their existence at that time, puts them out of the field as certainly as one body displaces another in space.

These considerations, and the evidence bearing upon them, are set forth in the brief, pp. 151–158.

It is true of and **B**, and also of **C** and **I**, not only that they are plainly mere experimental instruments, but their extreme rudeness is such as to show that they never yielded results enough to warrant a couple of days' work in making better ones. The story is that they were all he had for seven or eight years. It is certain that at any time when he was using them, he had not got results enough to warrant him in spending a day in making better ones. This is the more certain because he was a very neat and fastidious workman, as witness the instruments confessedly made after the Bell patent. Seven or eight years of continued use of those rude contrivances would have been impossible. Results which would have tempted him to much experiment if he was really an inventor, would have made him at once construct better instruments. (See brief, pp. 147–150).

The answer says that "during the years 1870, 1871, 1872, 1873, 1874," and prior and subsequent thereto, — particularly and specifically mentioning those years, and none others, — he had instruments which successfully and practically transmitted speech, and that they "are still in existence and capable of successful practical use" (p. 42, *supra*).

There they are, — **F**, **B**, **C**, **I**, **A**, — all which are alleged to have been made during these years. With the exception of the receiver **A**, which is only half an apparatus, and incapable of use by itself, they are wrecks, incapable of transmitting a sound, all the operative parts gone. No sound can now be transmitted by means of instruments alleged to have been made during the years named.

Here is an answer under oath, made when they had had these exhibits six months, — the record so shows (defts, i, 558; ii, 1073–4). There is in it no more persuasive nor important allegation than this, that instruments which existed before our invention and in the years named are still in condition to speak for themselves. That is all that lifts this above the level of a scrap-heap defence. The assertion is false. They knew it to be so when they swore to it.

Let me be perfectly accurate about this. Two instruments, **D** and **E**, are in working order or nearly so; but they are alleged to have been made in 1875, and though doubtless these are provable under the pleadings, yet the specific allegation about the years specifically mentioned is false.

May it please your Honor, it is not only that the answer insists upon that group of instruments as made before the close of 1874, but that date is itself plainly material. If we are right in our views of the facts and the law relating to Mr. Bell's invention, the date which the law gives him is in the fall of 1874. These gentlemen knew that when they filed their answer. With our moving papers we filed Mr. Bell's affidavit which stated the facts, and in their answer they not only say that Drawbaugh had made this invention in a successful practical instrument before Mr. Bell's patent, but in terms *before his invention*. If the allegations about the years specifically named are true, Drawbuagh was before the date we alleged for Mr. Bell, but not otherwise. That allegation was not a mere accident. It was the most material allegation in the case. How could they swear to that allegation when they had the instruments which they now produce? I cannot understand it.

We have in the record three hundred and sixty-six witnesses for the defence; all to prove that Drawbaugh made a talking telephone before Mr. Bell. If they do not come up to that, that the thing talked, and practically talked, they amount to nothing, except so far as they tend to prove that they go for nothing.

Now, if those witnesses prove anything, they prove this, that the first crude apparatus, the tumbler and tin can F and B, and every other set alleged to have been made before the close of 1874, were perfectly good, successful and practical telephones. Between four fifths and nine tenths of their witnesses are as to that group of instruments alleged to have been made before the close of 1874. That is not all. Half their witnesses are as to that first couple F and B, the tumbler and tin can. That is not all. Fully two thirds of their witnesses, if they prove anything, prove that an apparatus made up of that tumbler as a transmitter, and either the tin can or the flat instrument A — the farthest one — as a receiver, were perfectly good, successful, practical talking telephones. If you are going to believe their record, nine tenths of it, or three quarters of it at least, (not three quarters of four witnesses, but three quarters of three hundred and sixty-six), prove that these instruments, F, B, C, I, A, all that are alleged to have been made before the close of 1874, make perfectly good talking sets. The pair of little magnetos, D and E, those with the curled magnets, will talk; they are good enough to break any patent, if early enough. Well, may it please your Honor, they have got eight men out of three hundred and sixty-six witnesses to swear that they listened at D or E before the date of the Bell patent. Only eight, *and Mr. Drawbaugh is not one of them.* When you come to see those eight, you will know that they had better have left out half of them, who are bad enough to spoil any case. So plainly the defendants' proofs go to the same instruments as the specific allegations of the answer. Are they equally false?

Would your Honor like to know whether those instruments ever did or could talk? Would your Honor like to have been there when they were in working condition, if they ever were, and tried them? Would that help you in trying whether you should believe half or three quarters of this raft of witnesses? These instruments were produced. They have had man after man, farmer after farmer, with all the intelligence that belongs to the Dutch farmers of the interior of Pennsylvania, to come and swear to your Honor how well they talked; and when they got through with that, they finally thought it would be a good plan to find out whether they actually ever could talk or not; so they had Drawbaugh, their man, make what they called reproductions. The working parts, the most important of them, are all gone. Not a witness to all these instruments can tell what the insides were. They have the intelligence which belongs to their class, — they can tell a bootjack, perhaps a corkscrew. As to telling the mode of operation, or even the structure of those instruments, they do not know it. All they can say is that they went there at such a time and they listened and they heard speech. If those instruments are to be reproduced, Drawbaugh, the claimant, the party interested, has got to do it out of his own head, — nobody else, — restrained or assisted, as the case may be, by what remains of them.

I am going to read a passage to your Honor from the opinion of Judge Sprague, in the Howe sewing-machine case. That was a case like this. Witness after witness came and said they saw the machine. The remains of it were produced — brought into court. The witnesses said the machine sewed capitally — better than Howe's machine sewed. They always say that in these cases. All the witnesses remembered that it was better than anything now in existence. They produced the remains, and the man made what he called a reproduction and brought it into court, and it sewed, — they took a piece of cloth and made a seam, — carried the thread through, back and forth, not very well, but it sewed. They said, that is proof that the old machine was a sewing machine. I will read now from p. 146 of our brief: —

> "We come then to another part of the evidence, — *these old remains.* These are very important, undoubtedly; for, when a new invention is sought to be intercepted by a former one, the production of a former machine is, I will not say essential, but of a very great importance, showing that it does not rest merely in the recollection of witnesses that there was such a thing. These are the remains of a machine claimed to be invented by Mr. Hunt as a sewing machine, which was in the hands of Adoniram Hunt, and transferred to Arrowsmith, kept by him, and found by him, as he states, in 1851, in the rubbish of his workshop. They exhibit some of the instrumentalities, but certainly to the eyes of those who are not experts, but few of the means, of forming a sewing machine; and to the eyes of the experts they present the same deficiency. One, at least, of the defendants' experts, when he was called upon on a former occasion, looked at them, and then testified that there was nothing there from which a sewing machine could be constructed. He says now that he has changed his mind, upon a more careful ex-

amination. At first view, then, they would present no satisfactory evidence of having been a sewing machine.

"The reasoning of Cuvier, by which, from seeing a few bones, he could reconstruct the whole animal, proceeded upon the assumption that the animal was a perfect work made by a Creator perfect in His operations; and if the animal were a perfect work, then he could see from its remains what must have been necessary to make that perfect work. But that would be assuming the point in controversy here.

"The experts say that several parts of the old machine are the same as those parts in the new. Undoubtedly, as far as those parts go, they are the same as in the new machine. But how is it with those parts that are *not* in the old machine? These experts cannot say, reasoning by analogy, except upon the assumption that it was a perfect sewing machine." (Howe *v.* Underwood, 1 Fisher, 175.)

We have got in this case what the defendants allege to be the reproduction of what they say *these* were. The story which these tell, in the language of Judge Sprague in another part of this case, is, all that they necessarily prove is, that they are "imperfect remains of an imperfect machine." To prove that they are remains of a perfect machine is going something beyond what the remains themselves can prove. These defendants, or Drawbaugh, are to make what he calls a reproduction. He has had ten or fifteen years of experience since the time when he says he made the originals. I am going to show your Honor by and by that the so-called reproductions are far better than the alleged originals which the witnesses testified about ever could have been; by which I mean that they have in them, not only parts which are not now in the originals, and which may or may not have been there, which may have been of one character or another; but that the alleged reproductions contain parts and instrumentalities, in their most important features, for the transmission of speech, which parts not only are not found in the remains, but are inconsistent with the parts that are in the remains. But before I do that, let us see what use we are to make of the so-called reproductions. The defendants made them, and having made them, they called their patent solicitors and expert, Mr. Benjamin, to try them; and they put him upon the stand and had him testify that they were good, practical, operative, full-sized speaking telephones. Strong language. When we came to cross-examine him, we simply asked him to do it again. We said to the defendants, "Take your own time, your own place, your own conditions, your own operators. Let one of your men talk into the transmitter, and let the other listen. Do it your own way. We do not want to be open to a suspicion of doing it with a half-heart. Do it yourselves. But we will have a reporter to write down what is said by one of your men in the transmitter, and another reporter to report what your man at the receiver says he heard." We did that.

We spent three days at it. We printed those reports and put them in evidence in parallel columns. That is a trial by the Court: more than by the Court. It is a trial by the defendants, in the presence of the Court. More than that, it is a trial by the defendants of better instruments, as I shall show you, than they ever had. Now what is the result? I shall show you that they were under better conditions, were tried by better men, than ever they had the advantage of at Drawbaugh's shop. This was no longer a speech by one unskilled farmer to another unskilled farmer; but it was an attempt to use his apparatus by skilled experts. Now what is the result?

Let me, before I begin to state what was done, — that you may see that I am not exaggerating, — let me read just what they say they got out of the instruments in bygone years. I will take the quotation at page 160 of the brief. This is a question they put to Drawbaugh: they asked him what he got out of the first set, the tumbler and tin can. Every succeeding set was better than the former, he said. Not only that, but every succeeding receiver coupled with the tumbler **F** made a better couple than the tumbler and tin can **B**. The first was the tumbler and tin can, **F** and **B**. Now they ask what these were (defts, ii, 810): —

> "*Q.* 178. During that time, and before you made instrument **C**" [which is alleged to have been about 1868 or 1869] "what results had you been able to get with the instruments **B** and **F**?" [**B** is the tin can and **F** is the tumbler.]
>
> "*A.* Sufficiently good to be heard distinctly; there were even words that were whispered; you couldn't just hear the words exactly, but you could hear the whispering; I did that often; spoken words you could hear — the whole sentences — I mean words spoken out loud and not whispering merely. I would have persons in the cellar reading printed matter, — some advertisement

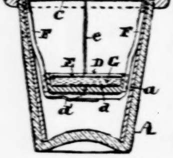
r something, — and I could hear the words that were read; and at other times I would go down into the cellar and read something, and, coming up, they would repeat the words to me that I had read."

That business was carried on in the machine shop with an unskilled farmer at one end; and, with these instruments, that couple, before 1870, they say that they got whole sentences and newspaper paragraphs. If you can do that, that is a speaking instrument. There is no doubt at all about that. Not that once in a while only they got it, and most of the time did not; but they got it constantly right along. Such an apparatus would be good enough for use. There is no dispute that it was good enough to use, good enough to anticipate, if this be true.

Drawbaugh himself testifies that at that time he thought his instruments, the tumbler and tin can, had reached such a point that they were good enough to patent (defts, ii, 926–7, 1096). There is no doubt about that, if they can do what he says of them. Now, can they?

We met in New York in a building in Fourteenth Street. By and by I am going to describe the instruments more particularly. We met there to try the alleged reproductions. Here is the alleged reproduction [*indicating the instrument*]. There is a picture of that "reproduction" of **F** on one of the cards, there is a picture of the "reproduced **B**." We met at rooms on Fourteenth Street, which the defendants had provided.

Perhaps I may as well here explain how "**F** reproduced," which your Honor has in your hands, operates.



The current from a battery comes down one of the side rods F, then half way across the bottom of the stirrup to d', then through the metal rivet d' to a metal plate d which lines the bottom of the wooden cup D inside. This cup is filled with a powder G, which will conduct electricity, though not very well. On top of this powder rests a metal plate E; this by the stiff metal strut e is fastened to the metal diaphragm C. To this diaphragm is soldered the silk-covered wire H, which leads to the receiver and through it to the battery. The current, therefore, flows from the battery down the rod F, the rivet *d′*, the lower inside plate *d*, the powder G, the upper plate E, the metal strut *e*, the diaphragm C, and the wire H, through the receiver and back to the other pole of the battery. If the cup D were of metal, this would not work, because the electricity would flow through it; it is of wood, which will not conduct electricity; so the current, to get from the lower metal plate *d* to the upper metal plate E, *must* flow through the powder with which the cup is filled.

Mr. DICKERSON. Inside of the wooden box. The wooden box is put in to be a non-conductor. In the bottom of that wooden box inside is a rivet, riveted through the wood, a metallic rivet, so that the current can get through the wood and pass into the lower plate, then through the powder and out by the top plate that lies on the top of the box.

The electricity, your Honor, goes down that wire F, goes up through that rivet *d′*, and strikes the bottom plate *d*. Now, in order to get out, it must flow through the powder G that lies in the cup. Then you see it runs up this wire here *e* and goes off on to the line H. That powder in here, if it is pressed more or less, varies the intensity of current.

Mr. HILL. Varies the resistance, you mean.

Mr. DICKERSON. Yes; and therefore varies the current.

The COURT. How does it get through the powder?

Mr. DICKERSON. The powder is a conductor, but a bad one. In order to make it go through that powder, that thing you see, that box, must be wood or some non-conductor, because if it were a good conductor like metal, the current would flow through the sides of the box and not through the powder. That is the reproduced instrument; here is the original instrument, which has no such apparatus as that about it. That is the original one; this is the reproduced instrument. This reproduced instrument is the one we are explaining, and the one that was tried in New York.

The COURT. How did the current get through there in the old one?

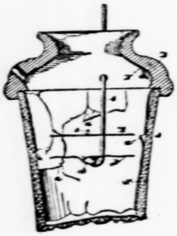
Mr. DICKERSON. It is said that there was a wooden box around this, and that it was riveted by a rivet through the bottom of it. This went through the bottom, and the wire is soldered fast to the bottom plate there. Here is the bottom of the plate in the old one; and here is the thing that did all the talking in the "reproduction."

The COURT. Of course there must have been a box around this apparatus to hold the material, whatever it was.

MR. DICKERSON. Yes, sir; there must have been a box around that, if it was such an instrument as they want us to believe it was. Now, that is the thing that hung by that loose wire in this one. In that instrument ("F reproduced"), your Honor sees, you pick up the top and then you have picked up the whole apparatus. The tumbler is a mere case to enclose the whole. You might hold it in your hand perhaps, just as well; it could be done. The relative parts are united to one base, as it were; that is, to the cap piece of wood. That is the diaphragm, varying the pressure to be put upon the powder by reason of the circumstance that this cup of powder is held up by these two suspenders against that top; and the diaphragm is held by its edges in the same top, while the centre of it to which the upper plate is attached, vibrates up and down. They say that in the old instrument F there was a bladder across here on the top of the tumbler for a diaphragm, and by some means or other this wire was run through the bladder. (See brief, pp. 170-4)

The COURT. The bladder was tied over the top of the tumbler for a diaphragm.

MR. DICKERSON. Yes, sir.



Original F.

Then the remains of the original show that the wire C, to which this lower plate is soldered, hung in that loose hole in the cover like that. In order to make "F reproduced" work, it is necessary to have the distance between the two plates exactly right; an infinitesimal distance out of place will spoil it. With such a thing as F,—that single wire,—you could not touch it even to try to adjust it without knocking everything out of place. That is one difference between the two.

In this F nothing can be got through. In that "F reproduced" there could. In the so-called reproduction, in order to keep the relative distance apart of these two plates, that cup and the plates are suspended, and both are fastened to that top — the wooden top.

Now, in the old one there is a single wire on one side. You could not touch that wire without throwing it all out of position. This membrane diaphragm instrument has never been tried.

The COURT. This is the reproduced instrument.

Mr. DICKERSON. Yes, sir; that is the reproduced instrument. They never tried a reproduction of the membrane-diaphragm instrument.

Mr. HILL. He had it in both forms, but he reproduced this form of instrument to show what was in both.

Mr. DICKERSON. There was no original produced of that one with the double rods. It was made for the purpose of being tested in this case. There was no attempt to make a test of this original F, or one like that.

The COURT. How about the tin-can instrument?

Mr. DICKERSON. The new tin can. This is an electro-magnet. This has two cores, around which are spools to hold the wire. That is called an electro-magnet — a coil of wire around a core. Here is a pair of binding posts. Those binding posts are not in this original.

Mr. HILL. Those are for binding posts.

Mr. DICKERSON. Here is a pair of binding posts, by means of which the wire going around the magnet can be kept fixed — to these binding posts. There are none on this original instrument.

Then here is a diaphragm of bladder. It has a metallic strip fastened there, which is the armature. That is riveted or glued fast to the bladder.

Now, when the varying current passes through the electro-magnet it varies its magnetic strength and makes it attract that armature more or less, and causes this diaphragm fastened to the armature to vibrate in unison with the variations of the current. Then the listener puts his ear to the open end of that can and hears.

Your Honor will see that on this old thing the listener could get his ear out here somewhere [*indicating a certain length of wood not appearing in the reproduced instrument*]. In that reproduced instrument, when first produced, the wooden board was of the same length as this old one; but when Benjamin, the expert, tried to use it, he sawed it off close to the open end of the tin can, so that he could get his ear to it (defts, ii, 1307).

That is the armature on the diaphragm; here is the electro-magnet. Then it was supposed that there was fastened to that diaphragm this armature; that is, fastened here to this. Then when they vibrated under variations of pressure, the listener was out here and heard it, having his ear placed here.

Mr. STORROW. The operation of the so-called "F reproduced" is this. When the mouthpiece is spoken to, the diaphragm vibrates. When it vibrates downward, the upper plate fastened to it presses down on the powder and makes it a little more compact. In that condition it becomes a better conductor; the current passes more freely and becomes stronger. When the diaphragm and attached plate move upward in vibrating, the opposite effect is supposed to be produced, and the current becomes feebler. Thus the vibrations of the diaphragm change the strength of the current furnished by the battery, by changing the electrical resistance offered by the powder inside this cup. That is what it was hoped the instrument would do.

The so-called reproductions were made at Drawbaugh's shop, by him and his brother, under his direction, for the purpose of being put in evidence in this suit (defts, ii, p. 905, ans. 650; p. 1036, x-ans. 1296; p. 1040, x-ans. 1326; p. 1074, x-ans. 1510). The defendants' expert, Mr. Benjamin, tried them Nov. 29 and 30, and Dec. 1 and 14, 1881 (defts, ii, 1294). They were put in evidence and sworn to by Drawbaugh as reproductions after that, to wit, Jan. 11, 1882 (defts, ii, pp. 904–5).

Mr. Benjamin had actually tested them — so he says — by transmitting sounds (whatever sound it was) through them before they were offered in evidence. They were not instruments that we asked them to make; they made them of their own accord. It was not we who first asked to have them tested. They made them — Drawbaugh made them — and he and their expert tried them, before they put them in evidence. When they put them in evidence and swore to them as correct reproductions, with more or less modifications, each of which was confessedly an improvement, we have got to take it that they were at least as good as those he remembered years back. Then they put Mr. Benjamin on the witness stand and they had him describe the trials of all those instruments that were made (defts, ii, 1224–1248), and then they put this question (defts, ii, 1256): —

> "*Q.* 54. Please refer to the various instruments made by Mr. Drawbaugh, and state whether you find any, and if so, which ones, to be good, full-sized, practical working, speaking electrical telephone instruments.
>
> "*Ans.* All of Mr. Drawbaugh's instruments that I have tested I know to be good, full-sized, practical working, speaking electrical telephone instruments; and with regard to his instruments and forms of instruments to which I have referred in my previous testimony, but have not tested, I consider that these, by reason of their form and construction, may fairly be included in that description."

Certainly, it was painting the lily a little, after they had got one hundred and twenty-five witnesses to swear that they talked, to call one more; and yet no one can deny that if the thing to-day would not do it, it does not make any difference how many witnesses they had. And they recognized that in their answer, when they swore that the old instruments were *to-day* practical, successful, working instruments. Not a word of that was true.

They had Drawbaugh make reproductions, and they got a man to swear that they were practical, working instruments. Then when we came to cross-examine him, we simply said, "Repeat the test that you have been swearing to." (Defts, ii, 1296.) He did it. I am going to read the result. These tests continued three days. They were not all tests of these two instruments. We tried most of those on the table. We tried the large instrument **H**, the Blake transmitter. I should add that it was agreed that Drawbaugh might repair all the instruments, so far as was needed to put them in the same condition as when Mr. Benjamin tried them, and this was done. (Defts, ii, 1300.)

I am going to read a little from the deposition of Mr. Pope, or rather state a little of it. The reports at each end were taken in long-hand and in short-hand. There were writers and reporters for both parties at each end, and the reports were all printed, and make a considerable portion of our volume IV. Mr. Pope collated them, and put them together in parallel columns and summed them up, and where there was any fair ground for question, he followed the defendants' notes. But there was no difference of consequence in these notes.

We met March 28, 1882, in the morning and began, and the first instrument we were to try was the "reproduced **F**." Mr. Benjamin in his deposition calls it "**F**"; your Honor will remember that what he refers to is the "reproduced" instrument. We had several experts on our side, and Mr. Benjamin and their experts on their side. They connected these instruments, and were proposing to ourselves to hear, as Drawbaugh said, whole sentences and newspaper paragraphs or advertisements, or something of that kind read so that even the common farmers could understand them through this "full-sized, practical working, electrical speaking telephone"; and when we met — we were about ready to begin — Mr. Benjamin said all he expected to get out of those first instruments ("**F** reproduced" and "**B** reproduced") was "*a sound and now and then a word.*" (Complts, iv, exhibits, p. 584; ii, p. 1323.) Prophetic speech! It was all he did get.

The instruments had already been rigged up and tested on lines which were run from the rear of the building in Fourteenth Street to the front room.

In the rear room were the transmitters as they were used from time to time during the experiments. In the front room was the receiver and the person listening. And yet I should not say in the front room, because the lines for the receiver were carried into a closet in the interior of the building, and the listener, generally Mr. Benjamin, the defendants' expert, retired into that closet and shut the door; and the window of the adjoining room was shut and nobody was allowed to move or whisper. Under those circumstances, very different from the noise of the machine shop, a trained listener practised with this particular instrument, a man of acute intelligence and trained faculties, instead of a country farmer, was listening with his utmost capacity to what he could hear, because the salvation of his case depended on it.

What did he get? In the first place, we arranged, — rather they arranged and adjusted "**F** reproduced" — I shall speak as to this adjustment by and by — by putting on a modern instrument for a receiver. Drawbaugh and the farmers did not have that advantage. After that was done, they put on the listening end the "reproduced" tin can as receiver, with the "reproduced" tumbler as transmitter. I will ask your Honor to turn to Mr. Pope's deposition, complts, ii, 1323.

The first thing the listener heard was that some one was counting from one to twenty: he recognized that. The next he heard was, "*I am now talking into transmitter.*" We found after a while that that was an old and familiar phrase. The next thing that was heard was a sentence spoken, the whole of which was, "I am speaking into the tumbler instrument with a galvanometer in circuit," of which the listener heard only the words "*galvanometer in circuit.*"

The next thing he heard was, "*Do you understand?*" Next, several sentences were spoken, out of which only three detached words were heard. Then they heard the word "*answering*" and the words "*what I say.*" Then several newspaper sentences were read, but none understood; that is all that was accomplished in half an hour.

Then we tried another test (compl'ts, iv, exhibits, 487). I have here in parallel columns what was said into the instrument at the transmitting end, and what Mr. Benjamin, listening at the receiver in his closet, thought he heard, the instruments being "F reproduced" and "B reproduced." The first thing that Mr. Benjamin said he heard was, "*I am speaking now into the old tumbler instrument; do you hear me?*" That was spoken.

Next, a sentence was read. Not understood.

Next, a sentence was read. No articulation.

Next, a sentence of 31 words is read, and only 3 of them heard, and those 3 are detached words.

Next, a sentence of 18 words is read, and 2 words were believed to be heard and those were not spoken.

Next, 13 words were read, but no words understood.

Next, a sentence of 24 words was read, of which only the word "*and*" was heard, and nothing more.

Next, a sentence of 24 words was read, and 2 words that were not spoken at all were believed to be heard.

Then a sentence of 16 words was read, but nothing was heard.

Then a sentence of 22 words was spoken, but Mr. Benjamin said that passing horse cars drowned the voice and he got nothing.

Then a sentence of 20 words, and he didn't get it at all.

Then 107 irregular numbers were uttered into the transmitter; Mr. Benjamin said he heard 63 of them, but when they came to compare notes, 16 of them were right and the others were all wrong. How is that for an instrument for practical purposes as a means of transmitting intelligence? If he had heard 16 numbers out of 107, and heard correctly all he did hear, it would not have been so bad.

Then they went on and read a sentence of 23 words, of which nothing was heard.

Then one of 27 words; none understood.

Then one of 36 words; none understood.

Then the same sentence was repeated, but could not be understood.

Then a sentence of 29 words, of which nothing was heard.

Then 22 words; nothing understood.

Then the sentence, "How is that for high?" was heard, whereas the sentence spoken was, "I see five cats."

Then followed four or five phrases not heard, and then there came again the everlasting "*I am speaking into the tumbler transmitter.*"

Then three sentences with 30 words; nothing heard.

Then came eleven phrases of 70 words; not a word of them understood.

Then 11 numbers, of which 4 were heard; 2 of these were right and 2 wrong.

Then 28 words; 2 words were believed to be heard, but they were not spoken.

Then 28 words again, and 2 words of that — "*New England*" — were heard.

Then another, "Did you hear the music? the music box is not now playing"; they heard the words "*music box.*"

Then, "A disconnected LeClanche battery stands on the table"; the word "*battery*" alone is heard.

Then, "Let's adjourn for lunch"; they did not hear that.

Then, "Everybody seconds the motion to adjourn for lunch"; it was now half past two, and they heard the words "*adjourn for lunch.*"

The tests were continued three days.

The case continued two years after that; they called two hundred and twenty-eight witnesses after that, but *they never repeated the test, even with those two "redroductions."* That is their test with better instruments, under better conditions: *their* test, full and fair. We spent three days there; we spent nearly a year afterwards in Harrisburg taking testimony. If they thought they could do better in Drawbaugh's shop, with Drawbaugh's farmers as operators, we should have been only too happy to have tried further experiments. They never tried it again. Nearly two years more testimony, but no more tests.

Now, farmers testifying from memory, Drawbaugh testifying from memory, and everything else of that character, — does all that go to make you believe that the originals, if they existed, of which these things are improvements and "reproductions," were practical speaking telephones, or speaking telephones that could even speak anything?

We will go on to the next set of instruments. The next set of instruments we find in these tests were the tumbler ("**F** reproduced"), and this marked "**A**," — the flat one. That, according to his story, as near as you can make out, is about as good a couple of instruments as he had until you get to **D** and **E**. His assertion is that he had no better couple before the end of 1874. This couple was said to be better than those, **F** and **B**, through which he asserts that whole sentences and advertisements were heard. We tried this couple; not **F** and **A**, but "**F** reproduced" and **A**. I will read from complainants' proofs, Vol. II. p. 1325, Mr. Pope's deposition. I may as well say here, that though they called over two hundred witnesses in surrebuttal, they called no witness to say a word in contradiction of this report and testimony of Mr. Pope. This is what Mr. Benjamin, listening at the receiver, says, after the utterance of each phrase or sentence into the transmitter, and I will print in italics all that was heard correctly. "Not heard"; "Not heard"; "What?" "What?" "Not heard"; "Not heard"; "Not heard"; "Not heard"; "Pretty faint"; "Great deal louder, but a peculiar twanging sound"; "Not heard"; "Nothing at all"; "Not a thing"; "Nothing at all"; "Quite good; can't you give us a sentence?" "*Answer back to me what I say*"; "Too faint": and so on for fifty minutes. This is a favorable specimen of results: I ask your Honor to read the rest. That was the best they got from that apparatus on that day.

The third day we tried again. We tried again tumbler "F reproduced" and A. Look at the precautions they took. The trouble with the instrument "F reproduced," if it operated as they say it should, was that the slightest disturbance threw it out of adjustment, so that you couldn't work it. A person walking across the room would disturb it; a strong sound applied to it would disturb it; a person putting his fingers on the table would disturb it. On the first and second days they had arranged it on a heavy office table; the last day they put up a heavy block of artificial stone on the heavy office table. They placed the transmitter on that. The operator leaned over it with the most scrupulous care and carefully modulated his voice; and got what? There were 137 phrases uttered into it on the second day; 7 of those were understood, and some words out of seven more, and that is all. The third day they had got better. They uttered 175 phrases into the transmitter, 35 of these were heard. On the last day when they had this block of stone and several days' practice, they (not Drawbaugh, but Mr. Hill and Mr. Benjamin) got through 35 short phrases out of 175 — familiar phrases for the most part. Now, your Honor knows that if an instrument, ten years before the Bell patent, had given that result, — and add to it the fact that the man who made that, being a first-rate workman with a machine shop at his command, a professional patentee and inventor, making his living that way, had never during ten years afterward put it to practical use, never went to the Patent Office with them, — why you would know how to account for his conduct.

If the instruments he had, had behaved as well as that, they would not anticipate this patent.

Then they went on with the so-called reproduction of C and the so-called "I reproduced"; the results were that out of forty or fifty sentences uttered into one end, the listener at the other end did not hear a single complete sentence. He heard detached fragments of several sentences. That is the best they could do with so-called reproductions of instruments C and I. For all these tests see brief, pp. 156 *et seq.*

This is what was done with instruments Drawbaugh made with the skill of 1882; how much could he do with the skill of ten years earlier?

Mr. Dickerson has called your attention to some features of the "reproductions" which made them better than originals could have been. Chief among these is the difference between what the "reproduced F" and the tumbler F must have been if F ever existed. The great trouble with that instrument "F reproduced" was that the pressure between the upper plate, which is fastened to the diaphragm, and the cup of powder had got to be exactly right. As Mr. Benjamin described it, the movement of the screw through "an infinitesimal fraction of an inch" would throw it out of adjustment. If it got so that the instrument "broke," as it is called, — parted contact between the carbon and the copper plate, — the consequence was that a loud sound was produced in the receiver, which could be heard several feet away. It was not only inarticulate in itself, but the loudness of the sound produced so stunned the ear that a person listening for sounds, so faint that he could not in a closet hear them, would have to wait for the next that came along.

See brief, p. 167 *et seq.* for the falsity of the so-called reproductions.

The original instrument F in the first place had a bladder diaphragm, as they say. The "reproduction" has got a metal one, which is a great deal stiffer, better, firmer, and more true. One of the advantages of the metal over the bladder is that it keeps its adjustment. Again, the upper plate, carried on a rod depending from the centre of the diaphragm in the upper plate, is firmly secured or soldered to the plate of metal. In the other, it has got to be fastened by a piece of bladder and perhaps a couple of washers, giving it very little stability.

The COURT. Mr. Dickerson has explained the difference between the two pretty fully.

Mr. STORROW. I did not know whether Mr. Dickerson explained it or not. Another difference was this: during the tests in New York, note the care with which this tumbler was placed on a heavy block of stone — an instrument of such delicacy that the slightest jar threw it out of adjustment. One can't but think that a nice workman falling on that difficulty — and if he ever had such an instrument he encountered this trouble every minute — with a tumbler with a broken bottom for nine years — would have tried to remedy it at least as far as to use a whole tumbler or make a better case. Think of a tumbler with a broken and uneven bottom resting on a bench in a machine shop as compared with the instrument and conditions in New York. Why! they could not have got a word through under such circumstances.

But that is not all. The value of these tests is not merely that they throw the instrument out of the case. Judge Sprague said in the Howe machine case that the fact that Hunt's machine would not work (when he had reached that conclusion), "made the oaths of the witnesses as inoperative as the machine." More than half of their testimony here, if it is to be believed at all, shows that the instruments **F** and **B** were practical speaking telephones. That is not true. Such witnesses are worthless.

Moreover, the very rudeness of instruments which, if constructed as alleged, required great delicacy, is fatal to the story. If Drawbaugh had got any results, or even used the thing half a dozen times, he would at once have made certain obvious changes.

There is some difference between having a whole tumbler and a broken tumbler, but there is no invention in it; nothing but workmanship. Is it possible that a man who got results which made him believe that that instrument was the greatest invention of his time, would have gone on using that? I think Mr. Dickerson pointed out to you how they used the tin can. As soon as Mr. Benjamin wanted to use it five minutes, he sawed this piece of wood off at the end. Would a man have gone on using that for nine years, getting a sound so faint that, in New York, Mr. Benjamin had to retire into a closet to hear it? What did Drawbaugh get? That he stuck to this for a week proves that if he got a sound, he got nothing which led him to hope that he could use it to convey words. Again the story is, they have witnesses to swear to it, Drawbaugh says, that a farmer down stairs would talk into **F**, read a newspaper paragraph, and he, two stories up stairs, would listen. They have got another witness who swears that one person who used their transmitter was Drawbaugh's boy, between five and six years old at the time, — he and the farmer. Why, that countryman and that boy did a thousand times more than these experts in New York could do with a better instrument. We simply *know* that is not true. Away with such witnesses!

In New York, we ran, as I told you what we called a tell-tale line between one station and the other. It was put up originally to enable the observers to know what was going on in the other room. But the particular advantage of that line in testing the instrument was this: The person listening at the tin can when "F reproduced" (the tumbler) was used as transmitter, would say, "It is too faint: it is too loud," or, "There is too much pressure," or, "There is not pressure enough"; or that he heard or did not hear; and the skilled man at the transmitter knowing every five words what was coming out would know whether he should speak a little louder or more gently, or whether he should screw it up a little more, or loosen it; whether he should bring his mouth a little nearer or farther off. These were advantages so inestimable that one can hardly measure them. Think of the condition of things. Mr. Drawbaugh at one end and a farmer at the other end. The listener runs down two flights of stairs. "Can't hear a word." "What is the matter?" "Shall I adjust it up or down?" "What is the trouble?" "Louder or lower?" The operator may guess, the farmer can tell him nothing. You might go a month there with that and not get even the few words that we got in New York.

The consequences of those tests knock out three quarters of the witnesses, so that you cannot believe what they say. It knocks them all out, — witnesses who have sworn to perfect speech through that tin can. It knocks out all who have sworn to speech with anything before D and E, that is, three fourths or more of their record.

These tests show that even if practical results had been attained in New York, they could not have been got with worse instruments by Drawbaugh's farmers at his shop.

D and E I am going to speak of by and by. They talked. It is a question chiefly of their date and their identity.

Now, I want to state to your Honor the history of this man's life.

It does not seem possible that a man who was a professional inventor, the virtual proprietor of a machine shop, not owning it, but having the free use of it, a maker of electrical apparatus especially, should have had such a thing as a practical speaking telephone all those years, and never sent it to the Patent Office, and never put it to use except for the gratification of mere curiosity. But when we come to look at his life, our amazement, — it is no use to say "amazement," the impossibility of believing that he could have done as he did if he had a speaking telephone, — it becomes, I say, enormously impossible that such a man, possessed of such an invention, could have done as Drawbaugh did. Not only that, we wonder, we are struck with amazement, we find it impossible to believe it. We find that not only the things that he did not do, but the things that he did do, exclude the speaking telephone from this case and from his life.

Among those is that card which I showed your Honor to-day (p. 53, *supra*). Would poverty permit a man to print a list of sixteen inventions and leave out the telephone which was to give him glory?

One of the most conspicuous witnesses — a particular friend — by the name of Holsinger, says that he lived alongside this man from the fall of 1873 to December, 1876, from a period two years before Mr. Bell's patent to a period after Mr. Bell's patent, and after Mr. Bell had become famous as the inventor of the speaking telephone. This man, Holsinger, was a printer by profession, had been an editor of a country paper, and is now. His story is that he was one of four or five men who helped Drawbaugh experiment with his talking machine. He says Drawbaugh's whole heart and soul were in those machines; he seemed possessed by some power by which he could never leave them. He says they not only got ordinary speech, but they tried something more difficult than common speech; common speech was not enough. They scratched on pieces of wood, and crumpled paper, and did other things; and the man at the other end would tell just what was being done. Speech was no test for them; they wanted something harder. Holsinger testified that during that time he did not know that Drawbaugh was working on anything except the speaking machine, unless it might be a magneto telegraph key. He says that he never knew that Drawbaugh was working at anything else. Holsinger is the man who printed that card. Holsinger says he did not know whether he worked on that telegraph key as completing a former invention or making a new one. By and by, we shall find from Drawbaugh's testimony a list a page long of the things he was working on *during those years;* all sorts of things. That is not all. Holsinger, in October and November, 1875, wrote newspaper articles for a country paper. One of them, about an octavo page long, had half its length, devoted to Drawbaugh, and what was going on in his shop. For two years he had been there, and he said Drawbaugh's heart and soul were in the talking machine; that it was the greatest invention that ever was, and he knew it. Drawbaugh was yearning to give publicity to it. And what Holsinger said in his newspaper article about Drawbaugh was that they were carrying on the manufacture of axles in his shop according to a patent of another man, and that Drawbaugh was making an electrical clock to exhibit at the Centennial.

Mr. DICKERSON. What page is that, and what exhibit?

Mr. STORROW. It is in the brief, page 201, and complts, ii, 1216. This printer was the one who printed the advertising bill-head I read to you this morning, as well as the card. He writes to the newspaper of Nov. 16, 1875:—

> "We have the pleasure of announcing to the wide world that our Milltown (Eberly's Mills) has now the new axle factory established in the old machine shop at this place by a company of four live and energetic members, one of which is our friend Wilson Bear, of Camp Hill, as general business manager, and M. N. Grove of Harrisburg, as corresponding secretary. They make the Kline conical compensating axle, a new invention of Mr. Kline's of Camp Hill, we wish them every success, for we think it is a very good improvement in that line.
>
> "ELECTRIC CLOCK WITHOUT A BATTERY is being gotten up in our town by Daniel Drawbaugh, to be exhibited at the Centennial next fourth. It will be one of the things not dreamt of by every one, and will be a great credit to the nation for its wonderful simple workings and great convenience."

He has got something which is a wonder; he is going to exhibit at the Centennial,— not the telephone that he has got, but a clock, which he is going to make. That is not all. What becomes of Mr. Holsinger? "Heart and soul in the telephone," and "never knew of his working on anything else." When he writes to the newspaper and puts it into print, the wonder of the world is the clock. Well, that clock attracted attention from time to time. This poor man in abject poverty could not raise $15 for a caveat.

We know it, because it is sworn to in the answer. In utter want of necessary tools and materials, even to duplicate his last perfect telephone, he makes an electrical clock. This particular one was about four feet high. When he got that done, he made another and another, and in 1876 and 1877 and the beginning of 1878 he made, out of his own resources, out of the depths of his own poverty, and in his utter want of tools and materials, — he made three electric clocks, from four to seven feet high, the last one being a handsome structure seven feet high, with a walnut case, with carvings; he had the castings made at the foundry; polished and finished them; had a compensation pendulum, etc. (See brief, p. 326.) That was when he had not tools enough to copy his last telephone, or means enough to raise $15 for a caveat. Well, that clock attracted the newspaper people. (See brief, p. 207.) It attracted the attention of his bosom friend, the newspaper writer, Holsinger.

In 1878 it was taken to Harrisburg and exhibited in a hall. He did not take it, but some man who bought it took it. It attracted a good deal of attention, and in the spring of 1878 a half dozen friendly newspaper writers go to the shop of this inventor of the telephone, at a time when the telephone was attracting everybody's attention, — getting into extensive commercial use, — these half dozen newspaper writers go there and come in contact with Drawbaugh. Now we are going to see what this man had. Nothing could be so sensational as the telephone for them to write about, if he invented it. The first newspaper writer, Musser, who had known Drawbaugh ten years, wrote about clocks. Drawbaugh and he spoke of telephones; Drawbaugh showed him one he had made, the tin can **B**, but did not attach much importance to the thing, and gave no hint that he was the inventor.

The next man who came along was Mr. Matthews, not merely a reporter, but one of the editors of the *Baltimore American*. This gentleman travelled from Baltimore to Harrisburg to see the clock. He meant to have an electrical friend go with him, who would understand it better than himself, but the friend could not go. He did not write his article at once after coming back, but wrote it six months afterwards. It was a long article. Drawbaugh knew him to be a newspaper man proposing to write an article. They spoke of telephones. Drawbaugh said that Bell ought not to be considered the first inventor of the telephone. Why? *Because it was found in a French book.* Then they went on, and Drawbaugh said he had experimented on the transmission of sound, but did not transmit speech, and never expected to. Mr. Matthews was called by us as a witness, and gives extremely interesting testimony. I will read part of the article that he wrote and printed in 1878. (brief, pp. 211 *et seq.*): —

> "It may be mentioned that Mr. Drawbaugh constructed a rude telephone long before Edison loomed up as the boss inventor. He never expected to send articulate sounds over a magnetized wire, but he believed that an alphabet could be arranged after the manner of the musical scale, and that messages could be transmitted and understood by the variations of tone and pitch. This unlettered country mechanic came very near anticipating Edison and Bell in the invention of the telephone. Nothing but his poverty prevented him from conducting his experiments to a successful issue."

That was Drawbaugh's own statement in his own behalf, — blowing his own trumpet to a man whom he knew was going to write a laudatory article about him in the newspaper, when Mr. Bell's instruments were in successful commercial use, and he knew it. After the article was published he received it and made no complaint. You may make every allowance that you please, for misconception, errors, faults of the reporter, faults of the newspaper editor, — although Mr. Matthews was a lawyer and had practised law for four years, — it is impossible to believe that one who said what led a newspaper writer to write that could have been the inventor of the telephone. But that is only the beginning of what he said to Mr. Matthews and to other persons.

[*Adjourned to Sept.* 23, 1884, *at* 11 *o'clock*, A. M.]

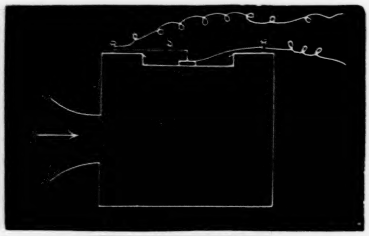
NEW YORK, Sept. 23, 1884.

May it please your Honor: There are one or two features in this tin-can instrument "B reproduced" which I showed you yesterday, that I wish to call your attention to again. I think it was explained yesterday how the varying currents, passing through these coils on this horseshoe magnet, varied the power of the magnet and thus its pull on that piece of iron which is the armature, and vibrated the diaphragm by the variations of pull which they exerted. When the varying currents produced in the transmitter are passed through those coils of the receiver, they will vary the magnetism of the iron cores which are included in these coils, and they will vary the pull which the magnet exerts on that armature or piece of iron which is fastened to the central part of the elastic diaphragm; and, as the pull is greater or less, it must follow that the armature and the diaphragm will vibrate in that way. Of course it is essential in an apparatus of that kind, first, that the armature should be within reach of the magnet. Although theoretically a magnet may extend its influence a considerable distance, yet practically the armature must be brought close to it in order to be seriously affected by it. If you put it an inch away you might as well put it a mile. In practice it is put as near a sixty-fourth of an inch as possible and within less than a thirty-second of an inch. It must also not be so as to touch; because, if, as it vibrates, it touches, it impairs the freedom of movement, and there also arises a difficulty which is known as "sticking." When the armatare actually strikes the magnet it seems to stick there; and it "sticks" quite strongly. This does not arise when you separate the armature and magnet by placing a piece of paper between; but when the two actually come in contact they "stick." Of course it is desirable that they should never come in contact, because they stick. There is no trouble in arranging them so that they will not stick; in every electrical apparatus that is done; and a man would readily know how to arrange it well. In using this instrument, this tin-can reproduction, in the tests which were made in New York, Mr. Benjamin experienced one difficulty, which occurred once or twice. In his endeavors to press the tin can to his ear so as to hear, he pushed against it, and it slipped once or twice under the strap which held it so that the armature came in contact with the magnet and it had to be drawn out again. Of course that is an inconvenience at the time, but it is nothing more than that, and it does not spoil the machine permanently, so to speak. The tin can is held down in this "reproduced" instrument by this broad strip of sheet iron. In this instrument, the original **B**, it is held down by this flimsy little piece of tin, held by two tacks only. It does seem impossible that that could have been used, without causing the same trouble or a great deal worse. It is a flimsy attachment with one tack at each end, and there never were any more tacks in it; there are no other tack holes, and it seems impossible that an intelligent mechanic, capable of making such a nicely organized arrangement as those which he made after Mr. Bell's patent, could have used B in that condition, without any attempt to remove that defect, when a moment's trouble, requiring no invention, but the simplest precaution, would have remedied it.

It seems impossible that a man could have used that half a dozen times without seeing the need of remedying that difficulty, and remedying it at once. A tack driven through the can directly into the board would have done it.

I now want to speak to your Honor of one other thing. I have told you what the speaking telephone was, and I think it will now be convenient to explain the Reis telephone. It is not a speaking telephone. Reis endeavored for a great many years to make a speaking telephone. He began about 1852 or 1853 to try to make a speaking telephone. He never succeeded, and the reason he did not make one was not because he was not a good enough mechanic to make what he wanted, and to construct such an apparatus as he had in his mind, but because he had not got the thing in his mind. He did not know how a telephone ought to be made, what it was, or how it ought to operate. He worked for years and years trying to make a thing which would talk. His idea was this. If I can make an electrical apparatus in which the sound waves, the air vibrations due to the voice, shall actuate it at one end, and in which the electrical changes produced by the voice shall actuate a receiver at the other end, I shall have produced at the listening end, by the voice of the speaker, sounds. He supposed that if they were due to the voice, the sounds would be the same as the voice. He made an apparatus, the mode of operation of which was such that when you pronounced a particular word at the receiver, you produced vibrations at the listening end, but failed to produce words. Reis made an apparatus which not only did not produce words, but what it did do was fatal to any approach to words. The thing which he did was this.

This woodcut will represent the essential acting parts of a Reis transmitter of one form. It consists of a box four or five inches square with a round hole in the top about an inch and a half diameter, across which is stretched a membrane *m*. On the middle of this is a little patch of metal at *m*, which you see, and that patch is connected by the wire which goes curling off to the right to one pole of a battery. A bent piece of wire *s* is so arranged that it is loosely jointed at the left-hand upper corner of the box, while its bent-over point rests by its own weight on the piece of metal at the centre of the diaphragm. The jointed end of this piece of wire is connected by a wire which you see in the cut that goes off to the receiver, and, passing through the coils of the receiver, continues to the battery. In this condition the current coming from the battery passes to the little piece on the centre of the membrane and then to the bent wire in contact with it and so on through the receiver. Now as that piece *s* is loosely jointed on the end, I can lift it up with my fingers, and the moment I lift it off from the patch on the middle of the diaphragm the circuit is interrupted and the current ceases; when I replace it, the circuit is closed and the current flows again. In that way I can, by lifting up the piece *s*, make and break the circuit and thus interrupt the current as often as I please. If I strike on the lower side of that membrane diaphragm with a little stick, this bent piece of wire, *s*, hinged to the frame of the box, will hop up and contact will be broken between it and the patch at *m* on the centre of the membrane, and the current will be interrupted. We frequently call *s* the hopping piece. I can thus break the circuit and interrupt the current by rapping with my pencil on the under side of the membrane or, indeed, on the upper side, instead of taking hold of the piece with my fingers. When the current thus alternately caused to flow and to be interrupted passes through the coils of any receiver, the core inside of these coils alternately becomes magnetized and demagnetized; it will then alternately attract and lose its hold upon an armature placed in front of it, and if that



Reis Transmitter.

armature be fastened to the centre of a diaphragm it will set that diaphragm vibrating. Each time the circuit is closed and the current flows, the diaphragm moves towards the magnet; each time the current is broken and the current ceases, the diaphragm will fly back. I can thus make that diaphragm waggle just as often as I make and break the circuit; if I can do that a hundred times a second, the diaphragm will vibrate a hundred times a second and produce a sound whose pitch corresponds to that frequency.

Striking the membrane with my pencil or a little stick is not the only way to make it vibrate. Suppose I speak into the open mouthpiece where the arrow is; the sound vibrations due to the voice will also shake and vibrate that membrane *m*, and if the parts are properly proportioned and the hopping piece *s* is made quite light, these vibrations will throw it up in the air and break contact and interrupt the current. If my voice, speaking in this mouthpiece where the arrow is, produces vibrations at the rate of one hundred a second, then the membrane will vibrate at that rate, and will make and reak the current a hundred times a second, — interrupt the current a hundred times a second and make the receiver, worked by its interruptions, vibrate a hundred times a second, and I shall get a sound of the corresponding pitch. But, as I have already explained to your Honor, an apparatus which works merely by interrupting the current with a frequency corresponding to the pitch of the voice, while it will produce a sound of the requisite *pitch*, cannot give any articulation, for it fails to take note of those peculiarities of vibration which occur during the time when there is no contact and the current has ceased, and it introduces other troubles. That mode of operation is perfectly incapable of transmitting speech. That is why the Reis is not a speaking telephone.

If you look at that, and are familiar with modern microphones, you will be struck with a certain resemblance. I explained yesterday that a microphone, which might be represented by a diaphragm like this, can be vibrated by the voice as to vary the pressure *without* ever breaking contact. This instrument of Reis was so devised, constructed and arranged, that whenever the voice is applied to it, it *will* break the contact; that is what he made it for. That is what it accomplished. That is the mode of operation which he intended it to have. That is all he hoped from it. He found after years of experiments that the thing would not talk; why, he never knew. He did not know that in a microphone the essential thing is that these parts shall never part company; that the pressure which one exerts on the other must vary, but that the parts shall be so arranged and proportioned and constructed and mounted, with springs or otherwise, that while they vary the pressure they never shall part contact, because if they do, it ceases to be a speaking telephone and becomes merely a kind of musical instrument.

Why is it that the microphone, which has a good deal of resemblance to that, as you look at it across the room, operates in one way, while this operates in another? I will not stop to explain fully why. There are a great many contrivances introduced in the microphone to give it its due and proper operation, which are not now material to be considered; but one of them, to which I alluded yesterday, is the fact that it has a weight to it. You see, as I play with this Reis transmitter, a strong blow on the diaphragm will make the hopping piece fly up quite a distance; a lighter blow, a less distance. It will be the same thing if I apply the same force by means of air vibrations; if I give it a strong blow, it will break the contact; if a light one, it will not. It can be so arranged that a given strength of vibration will not break the contact. If I should weight the part by putting an ordinary copper cent on the free end of *s*, the ordinary vibrations of the voice would not be enough to throw it up and break the contact. Even though that was made very light (and Reis intentionally made that very light), it might happen, because of the thing sticking, or because the voice was a little feebler than was expected, that for a moment it would not fly up and part contact. But Reis did not intend that. He instructed the public in his descriptions and advertisements (because he sold this thing quite extensively to colleges as an interesting scientific toy) that it was to be so used as to break the contact. But it might happen that a given tone of voice would not quite break the contact. Now, if it did not break the contact, what would happen? Why, the force of the voice, making a single vibration upwards, not quite enough to throw off that hopping piece and break the contact, might yet develop an increase of pressure at the point of contact; a little upward motion, not enough to throw that off, but sufficient to exert some force which would be manifested by a slight increase of pressure.

There you have very nearly the condition of the microphone. So it might happen that that instrument of Reis, although described and intended to be used normally and naturally with sufficient force to effect that vibration, might, once in a while, stick on that contact, and then it would be for an instant under conditions which would produce this true undulatory current, and a word might perhaps come through. I do not know whether a word ever did, but it has been asserted that occasionally words would get through. Mr. Benjamin, the defendants' expert, says in substance, that although this instrument is not a speaking telephone, and although Reis did not invent the speaking telephone, for he had not conceived the mode of operation which it is essential to base a telephone on, yet that it might happen now and then that this would stick on the contact, and that something like a word might get through (defts, ii, 1187). That, your Honor will see, is the state of the art which had been reached before the inventions, actual or alleged, of the two parties now before your Honor. The trouble with that was, not that Reis did not have the mechanical skill to make what he intended to make, but it was that what he intended to make was entirely a wrong thing. He had not got the right mode of operation. He had not got the right idea. He had not even got the notion in his head that the repetition of articulation, or the creation of articulating vibrations at the receiving station, required that they should be of a "*form*" appropriate to repeat a word as well as of the frequency to repeat the pitch. He could control the pitch, but he could not control the "*form*" of vibration. He does not seem to have had an idea on that subject. He does not seem to have known that this was required. He did not invent an apparatus to do that, because he did not know that it was to be done. It was a matter beyond his mental horizon. The chief promulgation of discoveries about the "form" of sound waves and the form of articulation came along some years after Reis's invention; they were fully announced in German in 1863, by Helmholtz, but not translated into English for a number of years thereafter. They were not known, except to well-educated men, even in 1876.

We might have said of Reis, and Reis might properly have said of himself, when the Bell patent came out, that he had been working at the attempt to transmit speech for twenty years. He had for more than twenty years; and he had failed; not because he did not make a nice enough instrument to perform the operation he intended, not because he did not have good enough mechanics, but because he did not know how to transmit speech. It was an old problem, a thing that people had worked on and talked of for a great many years, — attempts to transmit speech.

Mr. Bell was not the first who desired to transmit speech. He was not the first who experimented with the hope that he might learn how to do so, but he was, — apart from whatever Drawbaugh may or may not have done, — he was the first who told to the public how to do it.

Your Honor will kindly look at complainants' Vol. I. p. 540.

The COURT. Is the reference in your brief correct?

Mr. STORROW. Well, sir, yes, in a sense. Our brief, p. 211, contains all the reference about it. It had better be changed to complts, i, page 540. The article to which I refer is printed twice in our record; in Vol. IV. of Exhibits, p. 327, which is intended to be the reference in the brief, and Vol. I., bottom of page 540. That is the whole of the article of Mr. Matthews, beginning on p. 540, — the article in the *Baltimore American*.

I forget whether I said yesterday, — I think I did not, — that Mr. Matthews went there expecting to have an electrical friend go with him. The electrical friend didn't go. The consequence was, when Mr. Matthews returned he didn't write the article at once, expecting to go up again with his electrical friend. But the second visit never took place; and in the fall of 1878, about six months afterwards, he saw in the paper an account of a perpetual-motion machine or motor, built by Gary, which was to run by utilizing the force of a permanent magnet, or something of that kind; to run without winding, without a battery, and so on, and he said — probably not believing in perpetual motion, of course — that there was as much perpetual motion in Drawbaugh's clock as in that thing or in anything else; he therefore would write an article about Drawbaugh, which he did. It is in the book, two pages and a half long, and it closes with the paragraph which I read yesterday and which I will read again.

Your Honor will find the paragraph at the bottom of p. 542. If you should read the whole article you would find it extremely laudatory of Drawbaugh. Mr. Drawbaugh says that he knew Mr. Matthews's was a friendly visit; he perceived that at the time, and he knew he was a newspaper editor (defts, ii, 1075-8, 1090-1).

> "It may be mentioned that Mr. Drawbaugh constructed a rude telephone long before Edison loomed up as the 'boss' inventor. He never expected to send articulate sounds over a magnetized wire, but he believed that an alphabet could be arranged after the manner of a musical scale, and that messages could be transmitted and understood by the variations of tone and pitch. This unlettered country mechanic came very near anticipating Edison and Bell in the invention of the telephone. Nothing but his poverty prevented him from conducting his experiments to a successful issue."

Now that is his own statement and in his own favor, to a gentleman whom he knew was about to give him notoriety, when they had been discussing the telephone, then making a great noise in the newspapers and coming into successful commercial use. That is what he says to a newspaper writer in search of a newspaper article, — a laudatory article; and there is nothing in that article which Reis could not have said. Reis was experimenting twenty years before. He never conducted his experiments to a successful issue. He didn't know how. He didn't get speech; he finally gave up the idea of speech. When, therefore, you learn, either from that, so far as the man's own statement after occasion for a boast came in is to be read in his favor, or, if you learn from anything else, that he was at work on a talking machine, if you please to say so, or trying to make it, you have got nothing which will help you towards this case.

Now if your Honor will turn to complainants' Vol. IV. p. 398, — the thickest volume there is Vol. IV. of Exhibits.

Mechanicsburg was a considerable town, the largest in that immediate neighborhood, about four or five miles from Drawbaugh's shop. He lived in that town from the spring of 1876 to the spring of 1877, bought a house there, owned it and lived in it. Then he moved back to Eberly's Mills and let his Mechanicsburg house.

There were two or three newspapers in Mechanicsburg; two, the *Saturday Evening Journal* and the *Independent Journal*, were both published in the same office, almost different editions of the same paper,— published by the same editor and in the same office.

They had published articles, so it appears in the record, about the telephone, mentioning Mr. Bell as the inventor, as every other newspaper had. In the spring of 1878, one of the writers for that paper went to Drawbaugh's shop to see his curiosities; and, in short, talked with him, saw whatever Drawbaugh showed him, and, among other things, talked about the telephone. But what he brought away from that shop and wrote in his paper was not that Mr. Drawbaugh had invented the telephone, not that he had had a telephone for twelve years or ten years, but that he was *then* engaged, just as your Honor knows hundreds and hundreds of others then were, in inventing a new kind of telephone.

Let me read the particular paragraph. The first article (at the top of page 398) begins by describing the string telephone, of which your Honor knows, I suppose, and which is sometimes called the "lovers' telegraph." There is no electricity employed; it is an entirely different thing. It is generally made of two tin cans, the end of which is covered with bladder (not unlike that on your Honor's desk), and connected by a string. You speak into one end and the vibrations are mechanically transmitted along the string just as they would be through the air, vibrating the diaphragm at the other end; and what you speak in the one tin tube you can hear at the other. It is a mere mechanical contrivance. I don't know whether your Honor has ever seen one.

Mr. Dickerson. They are sold here on the street, as a toy.

Mr. Storrow. They have nothing to do with electricity and do not depend upon that at all; they could hardly be called a speaking telephone, although they are in a sense speaking telephones. You can speak from one place to another, but not as you can through a speaking telephone. People have used them for some time, and have improved and perfected them very much, so you can speak half a mile with them. They have become so perfected that the string or wire can be carried around corners and on poles by various contrivances, and are used quite extensively in this country, and have been for many years; there are some lines I think, half a mile long.

Mr. DICKERSON. The countrymen use the ordinary wire fence as a telephone.

Mr. STORROW. This article first describes the string telephone, which it says the boys and others were putting up around Mechanicsburg, and continues (complts, iv, 398; brief, p. 209): —

> "We have been informed that Daniel Drawbaugh, the celebrated mechanic of Eberly's Mills, *is* inventing a telephone on a different plan from that now occupying the attention of the scientists, which will produce the sounds louder and plainer than the mother invention."

And then it goes back to the string telephone, describing one put up in the town. There is the writer; he is a neighbor and acquaintance of Drawbaugh; going to his shop in 1878, — the shop of the man of whom this story is told. Drawbaugh *now* says he had been at work on telephones for ever so many years; that he had these perfect microphones; that he had been experimenting with a telephone for ten years, telling the public freely all that he had got. But what this newspaper writer learned was that Mr. Drawbaugh is *now* inventing a telephone which will be better than the mother invention; not that he originated the mother invention, not a bit. That is all that newspaper writer in search of a sensational article learned. He had all these telephones within reach of his hand if their story be true; he could not have helped knowing if their story be true, that Drawbaugh was the man who originated the telephone which he and everybody else had been attributing to Bell; and yet he said not a word about it.

Then a week or ten days afterwards he wrote another article in the same paper. I don't know whether it was the same man, but it came from the same office (complts, iv, 398; brief, p. 209): —

> "At Eberly's Mills, this county, is an establishment that rivals Dickens' 'Old Curiosity Shop' in many particulars, and in some instances outrivals it. About the time of the Revolution, we suppose, it was a grist and flour mill, and when it ceased to grind out flour for the bread of life, it passed into the realm of mechanics. For many years it has been the laboratory of Daniel Drawbaugh, the well-known successful inventor. There is nothing engages the attention of the scientific world that does not also interest Drawbaugh."

That is a curious expression to apply to a man who is an "original" inventor, that, when a new thing came up in the scientific world, and engaged others' interests, *then he* begins to take hold of it.

> "His fancy in the mechanic arts is oddly assorted and various, as can easily be imagined. His inventions have been many and useful, and his prospects for turning out something great and wonderful, as bright as ever. Among some of his best productions are nail machines, faucets, and electric clocks."

There is another list of what he did, — "his best productions" — with the telephone left out. If a man were going to name the best productions of a person he had spent an hour with, who had had these instruments long before Bell was heard of, who then had instruments in his laboratory — if the story is true — far surpassing the best in commercial use to-day, would he name as the "best" the nail machine, the molasses faucet, and the electric clock? Your Honor has the list of machines; it would take some time to run over them all. The article continues: —

> "Of this last invention he has quite a number constantly keeping time in the old mill. One has been running for more than five months, and has not varied from the true time over a few seconds. It has been examined by scores of people, about two dozen of whom have given orders for clocks of the same kind, which is encouraging to the inventor. Mr. Drawbaugh is an indefatigable worker in his special line, and never gets discouraged. He labors like he talks, with a rush and gush that nearly bewilders his auditors. He can talk more theoretical and practical science in half an hour than an ordinary mind would gather in half a lifetime. We are under obligations to him for much information in general, and telephones in particular, and the *Independent Journal* will be glad to announce the completion of the new telephone he is now constructing, and hopes the speaking machine will bring many dollars into the pockets of its ingenious inventor."

After that, may it please your Honor, after they had offered him the columns of the newspaper, he went to see the editor, so one of our witnesses testifies; Mr. Grissinger says that shortly after that time, in that spring, Drawbaugh came to his shop in Mechanicsburg with a pair of telephones in his pocket, — little magneto instruments **D** and **E**, — and he said he was on his way, or had just been to see Mr. Thomas, the editor of the newspaper (brief, p. 210; complts, i, 530).

Well, the next article that came out in that paper about telephones was to the effect that an Englishman had invented a microphone, — yet never a word about Drawbaugh's.

The next thing that took place in the order of events — perhaps not the next, just before that — there appeared one of the articles that I have spoken of, in addition to these, about the clock. A short article appeared in one of the Harrisburg newspapers, about the 1st of February or 2d of February, 1878, saying that Drawbaugh had got a remarkable clock which went by electricity from the earth, and never needed winding.

That started up a couple of gentlemen in Harrisburg who went over to see him, thinking that the article had not done justice to him, and they would do better. Those two gentlemen were Mr. Lloyd and Mr. Worley, school teachers of Harrisburg. Mr. Lloyd was an old friend, and had known him about ten years. He was principal of a grammar school, and Mr. Worley was principal of a high school. Mr. Worley had known him about ten years; had met him in Harrisburg; had been to his shop several times; had talked with him about electricity. Mr. Lloyd was a man given to electricity; he occupied a part of his time electroplating small articles of hardware for hardware dealers. He had that kind of intimacy with Mr. Drawbaugh which, although not as constant as that of a laborer living next door to him, was just of the kind to draw out from him the story of the telephone, if he had had a telephone. In all those ten years Mr. Lloyd had never heard a word about it; among his other inventions he had never seen that. Drawbaugh at one time brought his electrical clock and some of his other inventions to Harrisburg and exhibited them; took Mr. Lloyd to see them, but never spoke of telephone to him. He knew nothing about any such thing.

These two gentlemen went over and saw the clock, and they wrote an extremely laudatory article about that, saying that the State ought to make an appropriation and buy one and put in the Capitol.

I read from complts, ii, 1551, an extract from the Harrisburg *Telegraph* of Feb. 13, 1878, written by these gentlemen in consequence of their visit: —

"At Milltown, one mile from White Hill Station, on the Cumberland Valley Railroad, can be seen one of the most finished and unique clocks ever constructed by mechanical genius. It was invented and built by Mr. Daniel Drawbaugh, who, although rather unused to technical terms of the schools, is deeply versed in nature's secret workings. His invention is not the result of blind groping in the dark and accidental stumbling upon a new application of power, but the triumph of systematic research, patient investigation, and remarkable mechanical skill. The magnetism of the earth, an inexhaustible source of power, is made to oscillate the pendulum."

The COURT. It is hardly necessary to read all that here, to take up the time of the Court.

Mr. STORROW. Those gentlemen, one of them an old friend, found that to write about him in his praise; that was all. But they talked about the telephone, at that visit; both were called to the witness stand and testified that he said he was experimenting on telephones in the year 1878; this was in the spring of 1878, when Mr. Bell's telephone was out and thousands were in commercial use, and hundreds of people were experimenting on telephones.

It is in proof in this case that an army of inventors were at work, as is always the case when a new art is created, in trying to improve the instruments. (Defts, ii, 1259.)

He told them that he had made an instrument. That I may not misstate it, I will quote the language. Mr. Worley's testimony is in complts, ii, 1554:—

"*Ans.* 17. In speaking of the applications of magnetism, he was experimenting for the transmission of sound; but, while he could produce sound, it was indistinct and confused, and he thought of remedying that by receiving the sound in a box to which he could apply the ear."

Mr. Lloyd testifies that what he said to him as he remembers it was that he had produced sound by electricity, but that the sound produced a kind of back lash, and that he intended to control it by some means "that I cannot describe to you now."

He had, according to that phrase, got something which was like the sound he wanted; but it was not right, it was not plain, it was not distinct, it was not articulate, and he was trying to remedy that defect by controlling the sound "by some means that I cannot describe to you," says one. Says the other, "by receiving the sound in a box" to which he "could apply the ear." (Brief, p. 208. See especially brief, bottom of p. 219 and top of p. 220.)

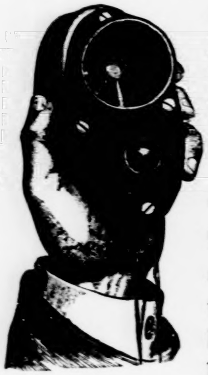
He was plainly a man who had got a telephone that didn't talk or didn't talk plainly, didn't talk well, and he was trying to improve it by a little mechanical contrivance connected with the receiving instrument to make it a little better. This is very much like what he said to the Mechanicsburg writer; he was trying to make a new kind of telephone which would produce sounds louder and plainer than the mother invention. Everybody was trying to do that.

Speaking telephones were introduced into commercial use in Harrisburg about January, 1878. A lot of newspaper extracts are put in evidence stating the way they were introduced and spread in Harrisburg. Harrisburg is three miles from Drawbaugh's shop, in sight of part of the village. About May of 1878 he went to the telephone office in Harrisburg; the telephones were then put out there by the Western Union Company; there was a quarrel between them and the Bell Telephone Company, and at that particular place the Western Union Company were putting out the telephones.

Drawbaugh went there under very peculiar circumstances. There was a man by the name of Stees, now dead, living in Harrisburg, superintendent or manager of a saw mill. He had a telegraph line from his office to another office, which he had used for about eight or ten years. He had had a great deal of trouble with it because he wasn't a good operator, nor were his clerks, and they had tried different instruments and were very much dissatisfied. The moment the speaking telephone came into use, he put them right on to his existing telegraph line, took off his telegraph instrument and put the telephone on, and was one of the very first who put them on.

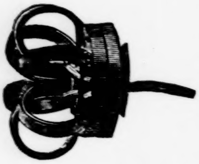
Drawbaugh in that spring went to Mr. Stees's office to try the commercial telephone. Mr. Stees had the usual faculty of grumbling at what was furnished to him by everybody, and he went on one occasion to the office of the Western Union Company and said to them, "Old Dan Drawbaugh is getting up a telephone that will beat yours" (complts, ii, 1035). That is all he ever said to them about Drawbaugh in connection with telephones.

Now, Mr. Stees had known Mr. Drawbaugh for ten or fifteen years, had been concerned with him in some enterprise, they got up a stamp canceller in 1865, and that was the remark Mr. Stees had to make then, — for whatever it is worth, and that is a good deal.



Presently he took Drawbaugh to the telephone office and introduced him, but not as the inventor of the telephone. He introduced Mr. Drawbaugh, and said that he would like to look at the telephones in the office. They showed him one. It was opened at Drawbaugh's request, and he saw the inside of it.

This is the pattern, — what is known as the "snuff box" with the mouthpiece off at one side. This is the one they showed him. He opened it and looked inside. Either that day, or a day or two after, or at the time when he opened it, he had with him his own instrument **A**. One cannot but see a certain resemblance between the two. He had this instrumment **A** with him, which, according to his story, he had had for four years. He showed it to the telephone manager and asked the latter, "Is yours patented?" "Yes." Then says Mr. Drawbaugh, "Mine will not do; it is too much like that."



The next thing he did, he went not long after, within a few days or a month or so, again to the telephone office, and asked them would they do him the favor to loan him one of their instruments, which they did. He took their instrument, a "Phelps Crown," said he wanted to study and examine it, carried it to his shop, kept it a fortnight and brought it back again.

Now, if this story is true, he had for four years, yea, for ten years, instruments which put these all out of sight. If his story is true, he then had at his office in his shop, microphones which far exceeded anything thought of then; yet he went through that experience and never said to anybody concerned in that office, "Why, I am the man who invented this thing years and years ago." (See all this in brief, p. 221.)

Next, in the summer of 1878, a man by the name of Scott, a publisher, undertook to get up a history of Cumberland County, one of these county histories which are not uncommon, and he employed a Mr. Nesbit to write a sketch or history of the town of Lower Allen, the town in which Eberly's Mills, where this man lives, was situated. (All this about the history and autobiography is in our brief, pp. 222–225.)

Nesbit, and Hull who assisted him, went there and saw one or two of the old residents. This was early in August, 1878, or the last of July. They went to Drawbaugh's shop, talked with him, had quite a talk with him, and wrote a sketch or history of that village, — a village of about twenty houses, and seventy-five inhabitants, containing a grist mill and this machine shop. They wrote a sketch or history of that village in Drawbaugh's shop while there. The original manuscript, written in that shop by Mr. Hull, was produced by Mr. Nesbit and identified by him. Mr. Hull is dead. It was, of course, rewritten and modified a little before it was published. It was published and will be found on complts, i, 689. It makes about two thirds of a printed page.

Half of that article was devoted to a description of Drawbaugh's shop (brief, 223; complts, i, 689): —

> "What was once a clover mill has been remodelled and fitted up as a machine shop. The present proprietor, Daniel Drawbaugh, some years since formed a stock company for the manufacture of measuring faucets and rotary pumps, and for a while the machinery was used for the purposes of this company; but finally the faucet machinery was removed to Mechanicsburg, and the works were much reduced. They are now applied, under the care of Mr. Drawbaugh, to the manufacture of his patent electric clock, which is a marvel of ingenuity, and promises to supersede all other clocks. They are said to be run by a turbine wheel of fifteen horse-power, and to be worth not less than $7,000."

It is not conceivable that a man wanting to blow the trumpet for that county, for that township, for that village, and getting up his trumpet in Drawbaugh's shop, should have left out the speaking telephone, if he had the least intimation that Drawbaugh claimed to be the first inventor.

Mr. Nesbit testifies that no such information was given him.

Besides that, Mr. Scott, the publisher, went to Drawbaugh to obtain his subscription. Drawbaugh subscribed $10 for this history, on condition that they would publish his biography in it, and they did. The arrangement made was that he was to write his own biography for them; not an uncommon arrangement where money passes in that direction, where it is the author who pays the publisher, and not the publisher the author. Mr. Hull and Mr. Nesbit were engaged by the publisher to write the *history*, or the part which I have read, but not any biographies. In an appendix at the end were a number of biographies got from other men in the same way.

Mr. Scott testifies that he had some blanks with questions for people to fill out who were proposing to print their biographies. He read those questions to Mr. Drawbaugh, and Mr. Drawbaugh had so much to say to him, "that his paper was not big enough; so he told Drawbaugh to write it out himself and send it, all he wanted to say." It was so agreed. Mr. Scott received by mail a biography which he understood came from Mr. Drawbaugh. It was put in the hands of his daughter, Mrs. McDowell, to revise, or perhaps prune down a little for publication, and after some pruning it was published. It covers about a third of a printed octavo page.

When we were taking this testimony, this took place. I called Mr. Nesbit, who had to do with the article, but nothing to do about the biography; he so expressly testified, and Scott, the publisher, so expressly testified and is not contradicted. He proved the writing of the historical part to which I have already referred your Honor. Then I proposed to prove the biography, and for that purpose I had Mr. Scott, the publisher, hunt everywhere to see if he could find the original manuscript, but it was all destroyed when the printing was finished. His daughter, Mrs. McDowell, then living in Cincinnati, had been brought to Philadelphia where the evidence was going in, to testify about that article. We had been extremely anxious to get the original, because if we could have got the original article in Mr. Drawbaugh's handwriting, it would probably have given us some information. The best we could have was the thing as printed, and Mrs. McDowell's recollection that she left out nothing of importance, and that she certainly didn't leave out anything about the telephone.

While cross-examining Mr. Nesbit, the defendants, evidently expecting this, produced from their own possession what they asserted to be, and what undoubtedly is, the original draft of the biography. It is in the handwriting of Mr. Hull. It was not the copy that was sent to the publisher. Mrs. McDowell thinks that was in Drawbaugh's handwriting. This was a copy or rough draft in pencil produced by the defendants themselves. Now we have all we want, — the rough draft of Drawbaugh's own biography, or his autobiography in his possession. And it is enough to settle the case. It doesn't spare epithets any more than such biographies generally do.

I read from complts, i, 705: —

> "DANIEL DRAWBAUGH. One of the greates inventive geniouses of *this* [the] age (so prolific of great men) is the subject of this sketch,"

Upon the occasion when he published his advertising card in 1874, modesty forbade him to mention his telephone; but part of his modesty had been gotten over by this time.

> "Danl Drawbaugh, who was born in the year in the quiet secluded village of Milltown three miles S. W. of Harrisburg where he has spent the greater portion of an active life conceiving & producing as a result of the conceptions of an unusually fertile brain, a score of useful ingenious machines & devices. It appears [that the] *by an* [in] examin*ation* [ing] the list of his inventions that the leading manufacturing intrests of the place (Milltown) in [his youthful] *his* boyhood days, gave direction to his thought & incentive to action. We propose to give herewith a sketch of his inventions but are sorry that we cannot accompany it with [a] *such* a discription of each as their importance merits His first invention was an automatic sawing machine, then a No. of machines used in wagon making next a machine for boring spoke tenets then a machine for sawing tenets a barrel stave jointing machine, patented 1851 this machi
> was pretty generally introduced & its merits apreciated, an *ated*
> matic grinding machine was next invented to meet a deman chines
> by the introduction of the jointer, then followed sever patented
> dressing

electric machinery attracted his attention and an electric machine was produced throwing out of consideration the galvanic Battery and [voltaic] *electric* pile, then a machine for alphebetical telegraphing; then the justly celebrated electric clock & the machinery necessary for its construction & several kinds of telephones one of which [was] is opperated by Batery and another by induction It will be seen from the foregoing that Mr. Drawbaugh has has penetrated vast fields in search of information & with what success, we leave the reader to determine. We are proud to own Mr. D as a citizen of our Township & deem him worthy of a position (of) at the head of the list of our prominent men and are hapy to accord him that position," — for ten dollars.

There is the list, there are his inventions, — every one of them. I will come to the telephone presently, but unless there is something different about that, all of them were *improvements in old and well-known devices,* — improvements in shingling machines, in nail-making machinery, in photography and so forth. He was plainly a man who picked up what was going on, experimented and entertained himself with the luxury of experimenting.

When we come to the last clause, "electricity and electric machinery" are mentioned, "throwing out of consideration the galvanic battery and electric pile."

There is no trouble in recognizing that as the magneto key which worked without a battery, as a small dynamo machine, or small call bell would.

"Then the justly celebrated electric clock, and the machinery necessary for its construction, and *several kinds* of telephones."

Would anybody speak of Howe as inventing "*several kinds*" of sewing machines? Or, would anybody speak of Mr. Bell as the inventor of "*several kinds* of telephones"? One man invents *the* telephone. Other men invent "several kinds" of telephones. Four months before he wrote that, three newspapers, from two of which I have already read, and another newspaper in Harrisburg from which I have not read, announced that Mr. Drawbaugh is now engaged in constructing or inventing "*a new kind* of speaking telephone." "*Several kinds*" by this time, and that is all he had to say about it.

Now I come to his next statement about telephones. You must remember that these articles were written and printed, not at a time when the telephone did not attract attention. There has never been a year when the telephone attracted so much attention, perhaps, as the year 1878. The novelty had not worn off. It was still marvellous, startling, surprising. Many people had not seen it. It was not only marvellous and startling, but the speed with which it was coming into commercial use promised a fortune to the owners of the patent.

Theodore Grissenger, of Mechanicsburg, was a dealer in agricultural implements, apparently a man of some means, a man who has made several inventions and taken out some patents himself. In April, 1878, he and his brother Jacob, and his brother-in-law, Jacob Shettel, the latter a connection of Drawbaugh's by marriage, became Drawbaugh's partners in the matter of the manufacture of electrical clocks. They paid him $500 down for their share, and were to pay all the expenses, etc., and for his labor in making clocks, and he was to receive certain other money out of the profits and proceeds — a certain share of the proceeds. Not long after the 1st of April, Mr. Grissinger, being one day at Mr. Drawbaugh's shop, said to him jokingly, "You had better have invented the telephone; there is more money in that than in the clock." Then you have the reply of Mr. Drawbaugh, "I did something in that way." Whereupon, Mr. Grissinger pricked up his ears and he thought, "There is money in telephones; I know that; and if this man has done anything, I would like to have a hand in that business." So he asked Mr. Drawbaugh a few questions, and the conclusion he came to from Mr. Drawbaugh's statements which he made to him was, in substance, that he had experimented some, but had not got any results,— had got nothing to show for it. (Brief, p. 220; app. 409.)

Next we find that Mr. Drawbaugh went to the office of Mr. *Theophilus Weaver*, a patent solicitor of Harrisburg, who was employed by this Clock Company to take out patents on the magnetic clock, which had never yet been patented. He had sold the clock before it was patented; and the purchasers were to bear the expense of patenting. Mr. Weaver had known Mr. Drawbaugh for ten or twelve years, and had been intimate with him, and they had talked much upon mechanical matters. Mr. Drawbaugh had been in the habit of going to his office and reading the Patent Office reports, from time to time, and he had got Mr. Weaver to look up the state of the art on various subjects. All this appears from Mr.

Drawbaugh's own cross-examination, and from letters and other papers that are introduced. During all those years Mr. Weaver never heard that Mr. Drawbaugh had a telephone. Now, here was a man consumed with a desire to get that thing patented; there was a fortune in it for him when he got it patented. You must bear in mind that he could have gone to the office of Mr. Weaver, and Mr. Weaver, without the $20 (which was his fee for taking out a patent), would have done it quick enough on credit for such an invention. During all those years Mr. Drawbaugh had been discussing with Mr. Weaver one contrivance and another, but never mentioned the telephone. That is not a matter of memory, merely; Mr. Weaver goes on the stand and testifies positively to it and is not contradicted; but it is not a matter of memory merely. Why, if such a thing had been brought to Mr. Weaver before telephones came into use, an application for a patent would have gone to Washington within twenty-four hours. Mr. Drawbaugh does not pretend that one word was ever said to Mr. Weaver on the subject.

Drawbaugh was examined and cross-examined, and on cross-examination was asked once or twice to whom he had applied for aid. He named two or three persons, but he did not name Mr. Weaver; but he did say that he had had Weaver look up the state of the art about other subjects on several occasions. Mr. Weaver, upon one occasion, examined Mr. Drawbaugh as a *quasi* expert witness. He was conducting an interference, and put Mr. Drawbaugh on the stand to testify about the models; that was in 1875. One would have thought that in the intercourse about that interference in his shop the subject of the telephone would have been drawn out; but nothing of the kind was said. In the spring of 1878 we find that Weaver was drawing an application for a patent on the clock, and Mr. Drawbaugh was in his office, and the conversation turned on the subject of telephones, which were then in extensive use in Harrisburg, and Mr. Drawbaugh said, and Mr. Weaver's answer is a long one, so I will read the most important part (complts, i, 398):

"That he, too, had experimented on the electrical telephone years ago, and before Bell came out with his invention, and that he had some results, but that they were not of such a satisfactory nature as to go ahead at the time with his experiments; that he had given up his experiments for the time being, and now it was too late for him to hope to have any standing as an inventor of the electric telephone." (Brief, p. 221; app. 390.)

Now, if your Honor will observe just what that is, and what Mr. Drawbaugh said about it. It was not a question whether he had made a successful telephone out of his own head, and did not know whether it was before Mr. Bell, or that he did not know what Mr. Bell's date was; but, as he stated it, it did not turn on any knowledge of the date; it was that he had never done the *thing*. He said, in substance, "What I did was years ago, but it was not a speaking telephone." Reis could have said that. At this interview with Mr. Weaver, Drawbaugh not only told him what I have read to you, but also told him that he was *then trying to improve the telephone*, — to make the sounds louder and more violent, — the same kind of statement which got into the newspapers of that month and which was mentioned to Lloyd and Worley and by Stees (pp. 109, 112, 113, *supra*); and he made a sketch of an amplifying lever to be attached to the diaphragm for the purpose of giving a greater range of motion; and that sketch is preserved, and it has been put in evidence; and it is not only put in evidence, but it is written on the back of a rough draft of the magnetic clock application, which was not begun until about the 1st of May, 1878; that fixes the date. So that there is no doubt about that incident. There is no doubt about the date. There is no doubt about the fact. If there is anything in Mr. Weaver's testimony which is not just what it ought to be; if he has overstated, understated, omitted or added anything, Mr. Drawbaugh could have gone on the stand to contradict him, but *he has not dared to do it;* after Mr. Weaver testified, the defendants examined two hundred and thirty-eight witnesses, *but they never produced Mr. Drawbaugh.* There was a diaphragm; and a lever was hinged at one side which extended to the centre of the diaphragm, and a motion given to the centre of the diaphragm would be greatly amplified at this end of the lever.

Mr. Dickerson. A mechanic would have thought of that, and so would any electrician.

Mr. Storrow. In Harrisburg there has resided, for nearly twenty years past, a dentist; his name was Dr. Moffitt, and he was rather an intimate friend of Mr. Drawbaugh. He had known him for twenty or twenty-five years, and he was called as a witness for the defendants. From a period as early as 1870, and some time before that, he had been in the habit of going to Mr. Drawbaugh's shop, partly for trout fishing in the neighboring run, and partly "on account of the interest he took in Mr. Drawbaugh's numerous inventions"; "almost any mechanical pursuit the man was working on, being interested that way myself to some extent." He was himself somewhat of an inventor, and had taken out a number of patents, and was interested in that way, appreciative of such things. He is called as a witness for the defence; and I am going, by and by, in another connection, to call upon your Honor to consider this testimony, as to what he knows and its effects. It is certain, that he did know all that Mr. Drawbaugh had done that was generally known to the community. With his knowledge, a man, to be presumed of respectable education from his profession, interested in inventions, with an acquaintance with Mr. Drawbaugh of twenty years' standing, visiting his shop on account of the interest he took in Daniel Drawbaugh's various inventions, Drawbaugh would have disclosed to him the speaking telephone the moment it existed.

In the fall of 1878, Dr. Moffitt determined to embark with Mr. Drawbaugh in some invention, and the one that he selected was another improvement in molasses faucets, — an improvement on an improvement in molasses faucets. He solicited to go in with him as another partner, Mr. Chellis, the storekeeper in Harrisburg, who kept the ninety-nine cent store there, a very enterprising man, and a man apparently of considerable means, and one of the defendants in this case (he is one of the three, as I explained yesterday, who got three quarters of Drawbaugh for nothing in May, 1880, and expanded him into five millions of dollars, — not directly into hard money, but into five millions of stock). They considered and determined to go in with Drawbaugh as partners in the manufacture of this new improvement in molasses faucets, then untried and unpatented; but before doing that they thought of telephones. Will your Honor turn to the brief, pp. 230–31? I will read from the top of p. 231.

They actually went into the faucet business about December, 1878.

Mr. Chellis testified on this point, and his testimony will be found in defendants' proofs, Vol. I. p. 548. Mr. Moffitt testifies (defts, i, 519): —

" *Q.* 24. Why did you finally decide to go into the faucet rather than the talking machine?

" *A.* Because I understood the faucet business better than the talking machine, and having asked Mr. Chellis what he thought of the talking machine as a speculative enterprise, he discouraged it and encouraged the faucet business, because, as he stated, there was more prospect of making money out of it, the faucet, in a short time, than out of the talking machine."

" *X Q.* 28. How long before you went into the faucet business did you have a conversation with Mr. Chellis about the relative merits of the talking machine and faucet?

" *A.* As near as I can remember, a month or two.

" *X Q.* 29. Your conversation must have been somewhere in the fall of 1878, I suppose?

" *A.* I think so.

" *X Q.* 30. Did he tell you why he thought there was more prospect, etc., as you have stated?

" *A.* Yes, sir. I remember that one of the leading points stated was that the telephone was already in use, and that Dan would have a hard time to establish his claim on it, and that there would be more money in the faucet than in the telephone business; his meaning was that Drawbaugh would have to establish priority of invention, etc."

Mr. Chellis says that Drawbaugh urged him to go in with him on the telephone, but that he did not. I read from defts, i, 548: —

" *A.* 12. Because I was interested in the faucet and motor business and wished to push them, and I did not think we could do much with the telephone, as Bell had a patent, and I didn't know that he could antedate them.

" *Q.* 13. During any of your early conversations with Mr. Drawbaugh on the subject, did you say anything to him about Bell's patent and claim of priority over all others?

" *A.* Yes, sir; and I advised him to drop it, the telephone, as he could not antedate Bell; he said he did not know about that; that he had been working on it a good while; it was his way of expressing himself; when I would say, You cannot antedate Bell, he would say, I don't know about that; I have been working at it a good while."

Reis might have said that. "It was his way of expressing himself," he was heard to say it more than once apparently. "It was his way of expressing himself; and when I would say, You cannot antedate Bell, he would say, I don't know about that." Does your Honor know better than he did?

Dr. Moffitt knew, Mr. Chellis knew, that he could not antedate Bell; and having had that conversation, those were the words that were addressed to Drawbaugh, "You cannot antedate Bell"; and Drawbaugh's reply was, "*I don't know about that;* I have been working at it a good while." This is what you learn from the testimony of Grissinger, who said that Drawbaugh told him also in 1878, that he tried it years ago, but never did it.

Now, I come to the next thing. That attempt to get a patent on that improvement in molasses faucets, in the year 1879, resulted in an interference contest between Drawbaugh and David Hauck, a mechanic in the neighborhood, who alleged that he was the first to make that invention. In that interference contest Mr. Jacobs, one of the three gentlemen who produced Drawbaugh to the world, was counsel for Drawbaugh and his partner Chellis and his partner Dr. Moffitt. Mr. Hill subsequently became counsel for them after the evidence was closed. Mr. Hauck, the other contestant, was a man who, with his brothers, had in July, 1873, bought out Drawbaugh's faucet patents. Drawbaugh had made two improvements in faucets, one in 1867, and had been manufacturing them in his shop for a while. In the summer of 1873, David Hauck and his cousin, of the firm of Hauck Bros. & Co., bought that patent and went on with the business and carried on there the manufacturing business for one or two years, more or less, in that shop. David Hauck worked there personally alongside of Drawbaugh, on the same floor, and in the same room most of the time. All that Drawbaugh had, he knew. It was impossible that he could have had a talking machine without Mr. Hauck knowing all about it. Mr. Hauck was an ingenious mechanic, — quite an intelligent man, — a man of some education apparently, if you may judge from the language of his deposition, and it is a fact proved by Drawbaugh himself that he was very intimate with Hauck, — very free in showing him his inventions. Indeed the evidence is that he showed him at one time this magneto key, which was intended to be an improvement on the telegraph key, and Hauck got him a chance to have the telegraph operator try it. The testimony of David Hauck in that faucet interference was taken in May or June, 1879, and Drawbaugh and his counsel thought it would be a good thing and it would enhance his standing as an inventor if they could make the Court believe that he was a man of great genius for inventions. So they opened the cross-examination of David Hauck, which was conducted by Drawbaugh and his counsel, Mr. Jacobs, first by proving that David Hauck was a frequenter of the shop of Daniel Drawbaugh, and that he knew all about Daniel Drawbaugh's inventions; that Daniel Drawbaugh was very free in communicating with him. And then they went on with a great mass of testimony, of which I will read a few words only. It will be found in complts, iv, 251 *et seq.*

Drawbaugh showed that both the Haucks certainly knew of all his inventions; each question is Drawbaugh's own assertion. They examined Samuel F. Hauck, as follows (complts, iv, 242): —

"*X Q.* 19. You and David A. Hauck frequently went to Drawbaugh's shop, and talked with him on the subject of machinery and of his inventions, did you not?
"*Ans.* We were frequently there together, but did not go there together; and talked with Drawbaugh about machinery and his inventions.
"X *Q.* 20. He was very free and accommodating in giving ideas and hints on those subjects to friends who asked him?
"*Ans.* Yes, sir; he was.
"*X Q.* 21. And David A. Hauck and the members of your firm were always on friendly terms with him, up to the time of this controversy?
"*Ans.* So far as I know, they were."

Then they examined David (complts, iv, 254): —

"X *Q.* 29. While he was perfecting his clock, he told you about his invention, and his experiments upon it, did he not?
"*Ans.* He did.
"X *Q.* 30. Once, or more than once, did he talk to you?
"*Ans.* He talked to me about it a great many times.
"*X Q.* 31. Did he ever talk to you about any of his other inventions?
"*Ans.* He did.
"*X Q.* 32. He was generally pretty free in communicating his ideas to his friends, wasn't he?
"*Ans.* He was."

So, plainly they knew everything.

Then they went to David Hauck on the issue they raised (complts, iv, 251): —

"*X Q.* 1. Mr. Hauck, you have been acquainted with Daniel Drawbaugh for a number of years, have you not?
"*A.* About ten years.
"*X Q.* His shop, which has been spoken of in this testimony, is situated at Eberly's Mills, in this county, a few miles from here?
"*A.* What he calls his shop is located at Eberly's Mills, this county.
"*X Q.* He is a machinist, is he not?
"*A.* That is one of the trades he is proficient in.
"X *Q.* Then he is a man of versatile talents, is he?
"*A.* He is.
"*X Q.* And a born inventor, is he not?
"*A.* That I cannot say, as I have only known him for about ten years.
"X *Q.* You are aware, however, that he has made a great many useful and ingenious inventions, are you not?
"*A.* What he has made since I have become acquainted with him, that I have any knowledge of, I would call imitations, although some of them might be patentable."

Then he went on to name as among such inventions the blower, the boiler feeder, the magnetic clock, the steam pump, the hydraulic ram; and said, " That is all that I can think of at present."

"*Q.* Mr. Drawbaugh has also invented a measuring faucet, did he not?
"*A.* He did."

May it please your Honor, they were trying to have David Hauck admit that this man was a great inventor. If there is a word of truth in their story, there is not a man in the universe who knew better than David Hauck whether Daniel Drawbaugh had telephones there or not in 1873, 1874, 1875. Think of it. They ask him the questions in order to show that he knew all that Drawbaugh had done. "Was he not in the habit of communicating his inventions to you? Were not you and your brother and Daniel Drawbaugh quite intimate?" They put these questions to him, and *he did not know anything about telephones.* That was not all. Then after he had asserted that Mr. Drawbaugh was an imitator and improver on other men's ideas and not an originator, they went on to question him: "Did he not invent this?" "Did he not invent that." And so *they* go on through two or three pages, putting to him questions of that kind, but *never once saying telephone.* They questioned him about clocks, faucets, blower and nail machines. Drawbaugh filled the record with suggestions, but *they never said telephone.* They wound up as follows: —

> "X Q. 52. And you undertake to swear that Daniel Drawbaugh is an imitator, and not an original inventor?
>
> "*Ans.* I believe him to be an excellent imitator, while I do not say that he could not be called an inventor."

And there they stopped. There are three or four printed pages of that. There it is; that record don't lie. *And they never said telephone once.*

We pointed out these facts and drew those conclusions on the record (complts, i, 836–8), and the defendants have not even attempted to meet them.

But that is not all; they had introduced this issue whether he was a great inventor. They had thought over it beforehand, and that is the evidence they offered to sustain it; no telephone mentioned.

Go a little further, may it please your Honor, and turn to page 118 of the same volume. After they had finished David Hauck's examination, the claimant's brother, H. F. Drawbaugh, went on the witness stand, and it appears from his testimony that he was in the habit of going to Drawbaugh's shop once a week for years and years; he has now gone on the witness stand and sworn that he saw talking machines there in 1872, that he was there constantly for several years after that, and down to the time when the suit began; that he never went there without seeing Daniel Drawbaugh working on these machines, and that they were perfect and practical machines; and not only that he saw Daniel Drawbaugh working on these machines every time he went there, but that he himself spent hours and hours himself in experimenting with them. That is what he *now* says he did. What did he say in 1879? Drawbaugh and his counsel having raised that issue, and that issue having been put into that case, as to whether he was a great inventor or not, Hauck and his counsel asked the witness, Henry Drawbaugh, this question: "Is not your brother, Daniel, a boaster?" He answered, "Oh, no; not at all." I am reading from complts, iv, 121, cross-examination, middle of the page. They asked him, "Is not your brother Daniel a boaster?" and he replied: —

"As regards the bragging, I say no; he is no braggadocio. And further, I never saw him make a machine that did not work. And as regards the faucet paying, he said it was a good thing, and would pay, and I was satisfied of that myself."

Think of the inventor of the speaking telephone, who had not a patent on it, who could not find means to get a patent on it, spending a whole year litigating on a faucet, and that only an improved kind of faucet!

But I will read further.

"*Q.* Please enumerate the machines that you have seen him make of his invention, that worked satisfactorily."

The COURT. When was this testimony given?

Mr. STORROW. In June, 1879. I have stated these things in order. It was after all these various publications, etc. The counsel for Drawbaugh in this case was Mr. Jacobs, one of the three gentlemen who produced him to your Honor; and one of his backers was Mr. Chellis. The witness, Henry Drawbaugh, answered: —

"*A.* Stave joiner, two stave cutters, two heading cutters, a shingle cutter, a harvester, a heading rounder, a nail feeder, a felloe saw, an electrical clock, a rotary pump, two faucets, a water engine, and a great many more, and not one of them but what would work; and the man had not the money to go into them and push them. That was what was the matter."

But he had the money. He did push the electric clocks. He found partners to put in money to go into that. Then he had partners to carry on the lawsuit about the faucet. He had other partners of whom I shall speak by and by who put $20,000 into the first faucet business. He could get money to go into that business; yet the telephone must wait.

I will go to another deposition, at p. 142 of the same volume (complts, iv). By and by Daniel Drawbaugh went on the stand; and Mr. Hauck and his counsel not being aware that he was the inventor of telephones, put to him a conundrum, and began by asking this question (complts, iv, 142): —

"*Q.* Since 1866 what machines have you conceived and perfected that have worked satisfactorily?

"*A.* To the best of my knowledge, I think that they all have. The nail machine gave satisfaction. I had it running in the works, but the nailers drove me out. The tram and red staff was a good machine, and adopted by a number of millers, and acknowledged by them to be a good machine. The magnetic clock I consider a good thing, but I am not through with experiments on it. I believe this last faucet is a good thing."

Where is the telephone mentioned? He does not say that he has invented that, and that he considers it a good thing.

We put David Hauck and Samuel Hauck and their workmen on the witness stand, and of course they testified they never heard anything about the telephone, and did not know anything about it. When Drawbaugh was under cross-examination we handed him this deposition, and asked him to read it. The question is (defts, ii, 1065): —

"*X Q.* 1480. Will you look at your own testimony in that record and say whether or not, according to your best recollection, the statements therein made by you were correct, and whether or not you wish to modify or explain any of them?

"[*Objected to by Mr. Hill as incompetent, irrelevant and immaterial,*" — the man's own sworn statement, — "*and as new matter not called out by the examination in chief,*" — I should suppose it would not have been called out in chief, — "*and as a matter not between parties to this suit.*"]

"*A.* I think the answers there made were correct, to the best of my recollection at the time. I don't know that there is anything there that I could wish to modify; I could look over it, but it would take a good while to look over it."

Then he was asked to look over it, but said he would prefer to take it away and look over it at home. Then he came in the next day, and the question at the top of page 1070 and bottom of page 1069 was put to him: —

"*Q.* Have you examined farther your deposition in the interference case to which your attention was called yesterday?"

He replied that he did not read it all; that when he got home that evening the neighbors had gathered for a prayer meeting, and requested him to be present, and could not decline, and so had not had time to read all of the deposition. He was then asked to complete the reading of it, and to answer the question, and after reading it he said: —

"I do not find anything there to modify. It was given to the best of my recollection at that time."

For this, see brief, 224–7.

Now let us put together in a series the facts I have mentioned.

Some time after June, 1874, he published that card which contains a list of his inventions. I want to read to your Honor the testimony about that (complts, ii, 1212). Holsinger was his most intimate friend, as I have explained (p. 96, *supra*); he lived next to Drawbaugh three years, and says he experimented with Drawbaugh more than did anybody else; and that the telephone was substantially all the invention that he ever knew of. He printed this card, and we recalled him simply to prove the card he had printed, and some newspaper articles that he had written.

" *Q*. 9. Please look at the advertising card which I now show you, and state whether you printed it while you lived at Eberly's Mills.

" *A*. Yes, sir.

" [*Objected to as immaterial.*]

" *Q*. 10. State, as near as you can recollect, how many of them you printed.

" [*Same objection.*]

" *A*. I printed one hundred and fifty the first time, and think I printed a second lot of one hundred and fifty; I am not positive as to the second lot.

" *Q*. 11. Did you deliver them to Mr. Daniel Drawbaugh, and did he pay you for them?

" [*Same objection.*]

" *A*. Yes, sir; I think he came to the office and got them; the understanding as regards paying for them was in consideration of the five dollars that Drawbaugh had given me.

" *Q*. 12. Was the first lot of them printed after he had given you the five dollars?

" [*Same objection.*]

" *A*. It would seem so from the fact that the type which I got with the money given me by Rupp and Drawbaugh is used on the card, which I did not have before I received that money; the card is printed on both sides and is as follows."

Then follows the card, already printed pp. 53–4, *supra*.

Drawbaugh had loaned him five dollars to buy the type with.

Although the witness was not positive as to whether a second edition of this card was printed, yet, inasmuch as he was not cross-examined on that subject, and as Mr. Drawbaugh didn't come on the witness stand to contradict his testimony, I think it must be taken as fairly proved that there were two editions. Your Honor will search in vain for any reason why the telephone was not mentioned in that list. Drawbaugh knew of it and Holsinger knew of it; and yet there is not a word, with reference to the telephone, printed on this card.

The next thing was the article by Holsinger in the fall of 1875, about the electric clock as a great invention. Then all the statements made in the spring of 1878. Then there was the visit to the telephone office, and no pretence made that he had invented the telephone. Then the biography. Then the adjudication by these parties, *suo judice*, in the case of Chellis and Moffitt. *Chellis now wants this Court to reverse that decision and on Moffitt's evidence.* Then this interference matter.

I have now stated Mr. Drawbaugh's history, or so much of it as is necessary for me at the present moment to go over, beginning with the year 1877. I want to go back and state to your Honor the history of that man before that time. I want to state if I can the main events of his life, his means, his resources and his surroundings from the time when he says he made this invention, until the time when he heard that Mr. Bell was famous as the inventor of the speaking telephone.

He was, as your Honor knows, a professional inventor and patentee. On p. 236 of our brief is a list of his patents, a dozen or more of them, from 1851 down to 1877. Their story is that he invented the telephone (I speak of that as distinguished from the perfected commercial instrument) in 1863 and 1864. He says that he talked through it with a daughter born in 1857, when she was about six or seven years old. One witness was produced who said that Daniel Drawbaugh showed him, in 1864, a drawing, or sketch (which shows nothing at all), and told him that he was *then making* a machine. Another witness says that Daniel Drawbaugh told him in 1865 that he *had talked* through it successfully. Now I want to show what his life was from that time, because the testimony is uniform from all their witnesses that this absorbed his whole thoughts from the time he first struck it, whenever that was (brief, pp. 236 *et seq.*).

On page 80 of the brief we have collected a considerable number of quotations, from something over forty of the defendants' witnesses, in which they say Drawbaugh told them he had a machine of the greatest value.

One witness said, "Well, he said a good bit about it. Yes, sir; he said it was the greatest invention ever was known."

Another witness said, "He said he could run it out for miles, and parties could talk in at the one end, and be heard at the other end, the same as persons in a room together." "He said it would eventually take the place of telegraphs." "He told me that he had n't the means, but that as soon as he ever got the means he was going to have it patented."

Another witness says that Drawbaugh said, "Uncle Dan, I am working at something now; if I can accomplish it, it will be worth thousands to me. He said if he had some person to help him they could make a nice thing of it very soon. He asked his best friends, he said, and they all refused him."

Another witness says, "He said, 'I have invented a great many machines, such as telegraph.' Then he showed me that he could telegraph by writing on a silver paper, tin paper, and put that to the wire, and it would write the same at the other end. Then he said, 'I have a talking machine that beats all the other of my inventions.' Then he showed me some fixings for talking in; I said, 'Daniel, this is wonderful.'" But they did not talk through it.

Other witnesses said that he said that it was a great thing, and he would make a great deal of money out of it. His neighbors had the same view about it, that if he could make a talking machine, — not that he had made one, but if he could make one, — there would be a good deal of money in it. "One of the men made this remark: Look at Daniel Drawbaugh: personally, you would not think there was more in him than a block of wood; and the idea of a man like him to try to invent a talking machine." One of the others remarked; "If he is successful in getting it finished, he will be the richest man in the valley."

That was the talk: "If he can succeed in getting it finished, he will be the richest man in the valley."

Again on page 84 (these quotations cover a number of pages), we have collected a number of passages as to what the rumor or story in the community was. The defendants have introduced witness after witness to say that they had heard Daniel Drawbaugh's machine spoken of generally. Generally it is put to them in the form of a leading question: "Did you hear Daniel Drawbaugh's talking machine spoken of?" and the witness says, "Yes." Now, you might have said as much as that about Reis. That merely shows, or at most tends to show, that he was trying to make one. Every now and then we get out from the evidence some real indication. Here is one; I take that of Jere Fry: he says that Drawbaugh did not talk, but sang through them; and, after that, "I talked with several persons that it is a very good thing if he gets it accomplished." That was as late as 1875.

Another man says: "I urged him to get it patented; he said that he had not it completed or in shape to get it patented, — that he wanted to make some improvements on it." This was 1874. "Afterwards we spoke about getting it patented, and his plea was poverty." "I know he pleaded poverty several times that I spoke to him about it after that first conversation, when he said that he did not have it in shape yet."

Another man, the cobbler of the village, says that in the fall of 1872, when a number of them were together, "I heard Emanuel Dietz make a remark in my shop about Daniel Drawbaugh and his talking machine. Daniel Drawbaugh was going along with his hands in his pocket, with his head bowed down, and Dietz said, 'Here comes Dan Drawbaugh, the damned fool, he will go crazy trying to make a machine to talk to people away off.'"

That was a remark which the defendants say was addressed by one of the villagers to another villager in the village exchange, the cobbler's shop, and the witness represents that all recognized it as true. It was not that Drawbaugh, in 1872, had had, for five years, a talking machine which talked perfectly well; but that he was then so far from success that failure was driving him crazy (defts, iii, 369): —

"*Q.* 17. You say that Mr. Drawbaugh was coming along in a stooping position at the time, and you illustrated it by rising in your chair and bowing your head down as if in deep thought; does that describe the appearance of Mr. Drawbaugh at the time?

"*A.* Yes, sir."

Ridiculous as this is, they want your Honor to believe that he had completed it five years before that, and had a completed talking machine; and yet here he was, with head bowed down, engaged in thought, trying to invent a telephone; and the remark is made that "he will go crazy *trying* to make a machine to talk to people away off."

By conversations of that sort you are able to get a little insight into what the villagers thought of him. There is a lot more of the same sort. It appeared afterwards, by their cross-examination of one of our witnesses, that Dietz was frequently in that shop, had lived for twenty years in that village, and lives there now; and yet the defendants did not call him. They put in, against our objection to it as hearsay, the cobbler's verson of what Dietz said, twelve years before he testified; and yet there was Dietz himself, living for years right alongside of Drawbaugh, still living there; and yet they did not call him (brief, pp. 291, 293, 310; app. 466). But I do not want to complain of that particular piece of testimony.

They say that Drawbaugh made this invention and made his first instrument in 1864 or thereabouts. If you believe his story, he talked with his daughter in 1863 or 1864. That daughter is not living. About that time he made an improvement in nail machinery, an attachment to a nail machine to feed nail plates; he found no trouble in getting partners and money both. He got three partners who put in money, paid for his time and had the invention patented. They paid for his time in experimenting, and for making a machine and for materials and for the expense of putting it up; a patent was taken out in December, 1865, and another in November, 1867. These three gentlemen put in a number of hundred dollars each. Mr. Drawbaugh did not know exactly, but as far as one can judge from his testimony, how much, they must have put in from one to three thousand dollars. Is that the case of a man who could not get assistance? *One of these three partners was Governor Geary of Pennsylvania.* Could there be a man better able than he to give publicity to the invention of a speaking telephone? It was just after the war. Governor Geary was then the foremost man in the State. Another partner was Governor Geary's brother-in-law and private secretary, Mr. B. Frank Lee. That business continued until

1872 or 1873. Just think of it! Living three miles from the capital, he had, for a partner, Governor Geary for five years, with a perfect speaking telephone in his possession, and nothing ever came of it. Try to believe that. Mr. Lee died in 1877. Mr. Eberly, the other partner, is living, and his deposition has been taken by the defendants; and in that deposition he says he never talked through one, but he thinks that Drawbaugh showed him one, and said to him if he wanted to go in, Mr Drawbaugh would take him in as a partner, but he never tried the telephone. That is all that Mr. Eberly knows about it. It appears from Mr. Eberly's deposition that he is a man stricken in years and broken in mind, and his testimony was so ludicrous about things which he swore to as positively as he swore to this, that it cannot have any weight. He swore that in 1867 he saw the flat instrument A, which, as a matter of fact, the defendants allege was not made until 1874. He is that kind of a witness. For the nail-machine enterprise see brief, pp. 239–243.

Next he invented an improvement in molasses faucets. One day the village storekeeper found fault with his molasses faucet, and said that it would not operate in cold weather. Mr. Drawbaugh said that he thought he could make something that would remedy the trouble. He made a wooden model, brought it to the storekeeper in a day or two, and asked him if he would like to put money in and get out a patent, and carry on the business of manufacturing them for half an interest. That was done; and Daniel Drawbaugh afterwards sold for $1,000 his remaining half interest, and got a good indorsed note for it; that was in 1867.

It turned out that the invention involved in the faucet (which was a rotary faucet, — you turned a crank, and it measured off the molasses something as a gas meter does) could be used as a pump for pumping water instead of molasses. Drawbaugh, having sold to these two persons the right to use that invention for a faucet, he proceeded to get up a company to buy of him the right to use the invention in a pump. He got up a pump company among his neighbors. The company was formed of six persons, and it began by raising and paying him $6,000 for the right to use that part of that invention. Daniel Drawbaugh received $5,000 of it in money, and $1,000 in one sixth share of the stock, one sixth of the property.

They did not pay him all in cash at the moment; they paid part in cash and part in notes, which ran along for about two years; but they were all paid in full. That was not all; they next proceeded to fit up a workshop; and, in order that I may be accurate about that, I will read from a deposition, which will be found in the brief at page 243. It is the deposition of John Drawbaugh, Daniel Drawbaugh's brother, who describes it. This company was known by several names at different times. It was sometimes called the Faucet Company, sometimes the Pump Company, and sometimes the Drawbaugh Manufacturing Company; but it was substantially the same concern, under different names. It was substantially and practically one concern, one enterprise. The whole matter of this enterprise is spread in the brief, p. 243. I will read from John B. Drawbaugh's deposition (defts, i, 616; brief, p. 243): —

> "*X Q.* 121. The Drawbaugh Manufacturing Company was the company composed of Gorgas and others who made your brother's patent faucets; was it not?
>
> "*A.* Yes.
>
> "*X Q.* 122. It was the same concern that was sometimes known as the Pump Company; was it not?
>
> "*A.* I guess that will want a little explanation to show the difference. In the commencement, the Pump Company and the Faucet Company were two different companies. After the invention of the faucet was completed, Daniel discovered that he was not able, for want of funds, to bring the faucet into the market. He sold the right of the faucet to a company by the name of Gardner & Crull for $1,000, for which he took Mr. Gardner's paper, with Jacob Croover's name as security. Then Daniel turned the faucet into a pump, or rather made a pump on the same principle as the faucet. On that they formed a company in the name of Mr. Gorgas, Musser, Hursh and others. They were to pay him a consideration of $6,000 as I heard. That company established a machine shop at Eberly's Mills, which some of the company told me cost them from $20,000 to $25,000. After manufacturing the pump for about one year they found the pump to be a failure. The company then purchased the Drawbaugh rotary molasses faucet from Mr. Gardner and others; the price they paid for it I do not know."

Mr. Drawbaugh was examined about that. Mr. Gorgas was one of the partners and bookkeeper of the firm, and was called by the defendants. The details they give are a little different from those stated by John Drawbaugh, but not materially. Mr. Gorgas testified (defts, i, 677; brief, p. 247):—

> "*Q.* 7. Up to what time did that company continue to manufacture and sell faucets and pumps?
>
> "*A.* I think up to the time of the sale to Hauck Brothers & Co."

Which was in July, 1873, six years after the company was formed, when the stock, good-will and everything was sold out to a new concern. I do not think they continued the business all that time very actively, but they were carrying on some business up to that time. Mr. Gorgas says they were carrying on some business up to that time. This shows that he had around him, therefore, during those six years, from six to nine partners at different times. They were men of means. One of them was worth $90,000; another was worth $40,000; another was worth $30,000; and another $20,000 or $30,000; and another is described as "well fixed." They were his immediate neighbors, farmers who lived in that wonderfully rich country, the Cumberland Valley. These were people who had lived within a stone's throw of him; and who, on the faith of his inventions, raised that money and paid it to him, and fitted up a shop. The concern went on; but apparently the demand for faucets was not enough to occupy their works and their capital; so in the spring of 1869 they proceeded to turn their attention to the manufacture of something else; and the first thing they did was to ask Daniel Drawbaugh (who was their master mechanic, their draughtsman and designer of machinery, for they did a general jobbing business as well as the particular business of manufacturing faucets) to furnish them with some other invention of his own, to occupy their $20,000 of capital and their machinery. He suggested that they make a stamp canceller, and a machine for making carpet tacks, and some other contrivances which he had formerly devised. There did not seem to be much money in those, and they did not take them. Finally, it was suggested that they should make a gas governor which he had invented; a contrivance to be attached to the private pipes of consumers, to regulate the flow of gas. It was an old contrivance, but I presume that he had made one of a somewhat different shape, or somewhat different in detail. He went to work and made a new gas governor to exhibit. Let me read from the records of the company what is stated as to them, — I refer to our brief, p. 250: —

"Jan. 29, 1869. Daniel Drawbaugh agreed to give his gas governor that he is now preparing to secure a patent for, to the company, for the company's use and benefit, the conditions to be agreed upon hereafter."

Daniel Drawbaugh testified (defts, ii, 1001; brief, p. 250): —

"I made the second gas governor more complete in order to show it to the Drawbaugh Pump Company for the purpose of illustrating it to them, for the purpose of getting them to take an interest in it. There were some inquiries made about the machine, and it was found that the gas companies would not allow it to be attached to the meter. I guess for that reason there was nothing done. They did not take an interest in it."

Not because they did not believe in him as an inventor, but because the gas company would not let them use it. They went so far as to have the thing tried in the shop. He fitted up a retort in the forge, put up a line of piping in the shop, put in the gas governor, and fired the gas retort. It leaked and destroyed the exhibition, and nothing more was heard of it. Not a word about the telephone. His whole company assembled at his shop to examine his inventions, in order to find something to put their money into; all there in his shop where, if his story be true, he had had telephones for two years: but no exhibition of them, no mention of them. That was in the spring of 1869. But they did not lose faith in him then. The next thing on the records are the minutes of a meeting held March 26, 1869, where you will find the following (brief, p. 251): —

"On motion of Henry S. Rupp and Daniel Drawbaugh, it was agreed that Daniel Drawbaugh shall, as speedily as possible, not to interfere with other necessary work, get up and make a screw machine for the use of the shop and for its benefit."

They had exhausted his list of inventions, and this company, with a machine shop and $20,000 of capital, now they wanted him to invent something new. Mr. Dorsheimer, from Buffalo, a relative of Mr. Gorgas, came there, and he told some of the members of the company that there was money to be made in manufacturing screws.

He said that it was a paying business; and Mr. Drawbaugh said he could easily invent a machine or get a machine that would manufacture screws. But what he did never came to anything.

In 1870 this concern reorganized. They had been a partnership up to that time, and they then reorganized as a corporation under the laws of the State of Pennsylvania, with a capital of $20,000, which was less than they had actually paid in. They called themselves the "Drawbaugh Manufacturing Company"; they named it after him, and formally elected him "Master Mechanic and Draughtsman." They got up a bill-head and an advertisement of what they manufactured, including a list of half a dozen of his inventions.

Now, may it please your Honor, there was that organization (which had raised $25,000 on the faith of his inventions), which had been going for six years, and was now seeking for something more of his to make; seeking some new invention of his; making some of his things and asking for more; he offered them one thing and another, and another, *yet never so much as mentioned a telephone to them during the whole of that time.* What is the use of saying that he never patented or used the telephone because he could interest no one? He never even asked them to put money into it; he never even mentioned it to them! What is the use of saying he had a practical speaking telephone, and that all he wanted was to get some one to put money into it, and to get $75 to patent it, and could not? *He never said one word about it* when he was there offering all these other things to his company. See p. 147, *infra.*

That is not all. On p. 245 of the brief we have a list of the partners, and a pretty fair list of the workmen. There were nine partners, and there were from time to time as many as eight workmen at one time.

We have got the names of sixteen, seventeen or eighteen who, at different times, worked for that company. Over six years this extended, with a shop full of telephones, and everybody knew it, so they say. Nobody could go there without seeing them, they want you to believe. One of their witnesses, George Hosler, the cobbler, testifying about the year 1872, says that a man must have been a deaf man in that village not to know about it, because even the children were talking about it. During those six years he was one of a firm of nine men, appreciating him, naming their company after him in the third year of its existence, with from fifteen to twenty workmen in their employ, and *not one of these twenty-five men ever talked through the telephone or ever was talked to through the telephone, or ever saw the telephone in a condition to be talked through;* yet with the exception of what is pretended by possibly two or three doubtful and discredited witnesses, it is not pretended that one of these men even so much as heard of a telephone during that time. It is certain that they did not. That is a pretty strong statement; but that is what the proof is; the uncontradicted proof, — the proof drawn from the defendants' own record. What is the use, if that turns out to be so, if these parties were there, ready to put money in his inventions, and were asking for more of his inventions, — and we have the positive testimony of partners and workmen who worked alongside of him that they knew nothing about it, — what is the use of bringing in those who only occasionally were there, farmers and idlers who loafed in there at times, to say that they knew all about these things?

At page 245 of the brief you have a list of the partners, — nine of them. *William L. Gorgas* was the bookkeeper, superintendent and time keeper, daily engaged at that shop for a considerable length of time, not for the whole six years, but during 1867, 1868, 1869. The *defendants* called him, and had him testify about some money transactions between Daniel Drawbaugh and the company, but *did not once ask him about telephones.* They called man after man, and man after man, from fifty miles away, to say that they had heard somebody say, that they had heard somebody say that they had heard that Drawbaugh had a talking machine. They put on the witness stand the claimant's partner, the foreman and timekeeper of the company, now the teller and bookkeeper in a bank in Harrisburg, yet they did not ask him one word about that.

Then they put on the witness stand *Samuel F. Hertzler*, a twenty-year-old friend of Drawbaugh, a farmer who lived close to the village, only one field distant from Drawbaugh's house, a man worth $40,000, a wine grower, — makes and sells wine, — who naturally would have known all that was going on. They put him on the stand to prove that Drawbaugh once came to him to borrow five dollars, and that he was very slow in paying it; that Drawbaugh bought provisions from him; that Drawbaugh's children would come and buy provisions and would sometimes not have the money to pay for them, but would say, "Pa would fix it," and they always got the provisions just the same. They put that man on the stand, *yet did not say telephone to him.* They are the parties who have got the burden of making out a case. He is a responsible man, a man of means in that place, but there is not a word said to him about the telephone.

They then put *Mr. William R. Gorgas* on the stand, a man who lived near the village, a mile and a quarter from Drawbaugh, who has known him for many years, and was a partner; who was worth $90,000; and they asked him whether Mr. Drawbaugh ever applied to him for any money. He answered that he had, at one time, after the Faucet Company wound up, between the summer of 1873 and the fall of 1877, at which latter date Gorgas moved over to Harrisburg; that Drawbaugh once said to him at the shop, "I have got an invention that I want you to put some money in." He said that he did not care to do it. That is all. There was no pretence that it was the telephone. Why, the shop was full of contrivances that he wanted men to put money into. There was no pretence that anything was said to this man about the telephone, and not even a suggestion that there was a telephone there. Not only that, but Drawbaugh was asked in his own deposition whom he had applied to put money in, and he named two or three, but did not say that he had ever asked Mr. Gorgas for money for his telephone. So Gorgas was a man to whom he did go for aid about other inventions, but not about telephones, and there is not a pretence nor an intimation that he ever saw one or even heard of one. See for Gorgas also p. 147, *infra*.

Then we called *Mr. H. S. Rupp*, a florist, a man of wealth, the largest greenhouse man in the county, a man of high standing in that community, who has known Drawbaugh for a long time, and he said that Drawbaugh had been to him a number of times about various things, and had shown him his inventions and had talked with him; yet Mr. Rupp had never heard of the existence of a telephone or of anything like it in Drawbaugh's shop until he went there once in 1877, after he had seen speaking telephones elsewhere; and he then listened at that instrument, the tin can, and heard a sound, but could not make out what the sound was. That was in 1877. For H. S. Rupp, see brief, pp. 248–250; app. 435.

Then we called *Mr. John F. Hursh*, another partner, and he said the same thing; that he had heard of it first in 1877 or 1878. Hursh was a man worth $30,000, and was living between two and three miles from Mr. Drawbaugh. There is no escape from that testimony. For Hursh, see brief, p. 248; app. 443.

Now, look at the workmen. We called first of the workmen on that list, *Jacob Carns*. He worked three years for that Faucet Company, from 1867 to 1870; and he boarded for six months of that time in Mr. Drawbaugh's house, and taught music to his daughter; he was the musician of the place and played the organ in the church; but he never heard of the telephone. He was the young man of the establisment, and was just the one who would have been called in when experimenting was going on, and he was called in when there were experiments about other things; but he never heard a word of a talking machine (brief, p. 249; app. 248).

I will not go through with this list of workmen. Curiously enough, the defendants called three or four of those workmen, but they never told the Court that they were men who worked for the Faucet Company (brief, p. 248).

They called *John C. Smith*, who was born and brought up in that village, and whose father lived there at 1878; and he testified that in 1872 and 1873 he was running as a fireman on a locomotive engine; and that on off days and on Sundays he used to go home to see his father, and would spend most of his time in Drawbaugh's shop and, "as near as he could remember," used to experiment a great deal. He is not quite sure about it; but the inference intended is that he spent almost every Sunday experimenting on the talking machine, — with that tin can and tumbler. That is all the knowledge that he pretends to have. The inference you get from the deposition is that that was about the only time when he was much at the shop, and therefore that must have been the time that he saw it, for he was not much there afterwards. Now that fellow worked three years for the Faucet Company, — 1868–70; and he does not pretend to any knowledge of the telephone before 1872. But that is not all. It turns out afterwards, that this man Smith worked at the shop in

1877, was building a portable steam engine there, and was working there for himself, off and on, for about a year in 1877. There was not a word of inquiry about that; we proved it afterwards by Drawbaugh's cross examination. For Smith, see brief, p. 248; app. 91.

If that is true, it cuts off five years of their history. If we were to sift the testimony of these witnesses, one half of it would go to prove affirmatively that telephones were *first* there after 1876; this man cannot be in the least relied upon to prove that they were there before that. His deposition is simply romancing. It is worthless as tending to fix the date. It does not appear from his deposition that he was there in 1877. This important fact to enable the Court to judge of him was not furnished to the Court. He must have clean forgotten that he worked there in 1877 a good part of the year. How many other witnesses are in like case? My brother on the other side would have done well if he had left out that deposition, for it gives us much insight. The witness must have forgotten that he worked there in 1877, a good part of the year. He has substantially no recollection of clocks which were very prominent there in 1877, yet we know from Drawbaugh and from a previous deposition of this man in the faucet case given in 1879, that he worked there in 1877. What is the good of a memory like that? Yet in intelligence and what passes for honesty, — the mere absence of a deliberate intent to lie, — he is as good as others.

There are a number of witnesses among the workmen who were called, who alleged that their first knowledge was obtained between 1873 and 1874, and so on; but they do not say that they were working with the Faucet Company. From some of them we find that out by cross-examination, and as to others we find it out otherwise.

Now, if it were one man only, we might suppose that he had forgotten it; possibly with two; but I think not. The defendants, searching high and low, and calling three hundred and sixty-six witnesses, *have not got a human being during these six years, among the forty partners and workmen, who pretends to have attempted to talk through this machine while connected with the shop, except two of the Drawbaugh family.* Let us see just what they have got. They have one man, E. B. Hoffman, a witness thoroughly discredited as a romancer of the worst kind, who testifies that he thinks that while he was there (and they got the date when he worked there incorrect; they have got it in the latter part of the year instead of the first part of the year, which, perhaps, is of no great consequence, although it is a circumstance that is to be taken into consideration with the rest of his testimony) once or twice he saw lying on the bench something like the mouthpiece of the tumbler instrument. That is all he knows. Three years after he left there he says that he talked through the tumbler and tin can, and heard speech perfectly well. That is as untrue as the rest. He is the bridge witness; for him see brief, pp. 254, 394, 532; app. pp. 134, 750.

This case has been going on for four years. In this last year of the case, and in surrebuttal, they called one John Schrader, who was a workman in the employ of the Drawbaugh Company for six months, and lived in Drawbaugh's house for two months, in March and April, 1869. All that he ventures to say is, that upon two or three occasions Drawbaugh took him into his private room and showed him something like a tin can, he thinks, and something like the cover of a tumbler, or a wooden cap piece, and said that those were for a talking machine; and he thinks that on several occasions Drawbaugh mentioned something of the kind at the table at his house. Now, if Drawbaugh had had a practical talking machine at that time, freely shown and known to all, as is now claimed, you could not have got one whose opportunities would have made him a much stronger witness to prove it than this man. His evidence, if accepted, disproves the story and all the facts essential to a defence during his time. For Schrader, see brief, p. 255; app. 658.

In complts, ii, 1147, appears the testimony of Mr. Henry S. Rupp, a very intelligent man, a man of affairs. He testified for complainants that, being a partner in this Faucet Company and tolerably familiar with Mr. Drawbaugh, Drawbaugh had a good deal to say to him about some other inventions, but that, curiously enough, he had never heard anything of this telephone before 1877. Thereupon the defendants put into his hands what purported to be an affidavit signed by one Dr. Musser, who was at one time a partner in this Drawbaugh Manufacturing Company. Dr. Musser was living at the time this controversy began, but died in 1881, before either side took testimony. But the defendants, before it was known that there would be a controversy, and before we had a chance to know anything about it, and afterwards, went around the country gathering up *ex-parte* affidavits. When it burst upon the world that there was to be a controversy, we found that they covered that neighborhood with *ex-parte* affidavits; and when we came to investigate the question afterwards, we saw the effect of that course in that community.

We then found that that entire community was committed *ex-parte*, upon such statements as could be got out of them, by men zealous for one side only, and employed in taking *ex-parte* affidavits. They were not entitled in any suit, and were sworn to before a justice of the peace. They could not have been used here; they have not been used anywhere. We have no information as to what they were to be used for; they were not produced in court. The effect was to forestall inquiry on our part, and to make whatever testimony has since been produced for the defence little better than *ex-parte*.

They had been to Dr. Musser on the 7th of December, 1880, and had taken from him an affidavit in which he says (complts, ii, 1146): —

> "Between the years 1867 and 1872 I frequently visited the shop of Daniel Drawbaugh, at Eberly's Mills. Some time during that period, Drawbaugh told me that he was at work on an instrument for transmitting vocal speech over a wire by means of electricity to a distance, and showed me an instrument which he had constructed for that purpose. He called it a talking machine. I have it now before me, and am able positively to identify it. This was somewhere between 1869 and 1872."
>
> He further states: "I have known Daniel Drawbaugh for twenty years. I am acquainted with his reputation for veracity and honesty," and everybody ought to believe him upon his oath.

Of course that is an incompetent and *ex-parte* affidavit. It is the affidavit of a man thrown into this case *ex-parte*, and is in every conceivable way foreign to the case. It is, however, of considerable value, as *he is the only one of these nine partners from whose lips those defendants have been able to extract a word about a talking machine;* and all that can be got from him *ex-parte*, and under such circumstances as I have stated, is that Daniel Drawbaugh had told him he had something to show him, and showed him something and said that it was a talking machine. He did not talk through it. Why? That is the most extraordinary thing in this case. There were from time to time intelligent men, and men of respectable education, who visited that shop; but they were not the men who talked through the talking machine. The defendants, in their record, have called three or four witnesses, of respectable education, who testified that they never talked through the talking machine, although they state that Daniel Drawbaugh showed them something and told them it was a talking machine; and they said, "Good morning," and went off. We find, most extraordinarily, that the most intelligent men, who think they were informed by Daniel Drawbaugh that he had a talking machine, never saw one. There are three grades of witnesses in the defendants' record. The better class, the substantial land-owners, neighbors, friends and partners, Gorgas, father and son, Hertzler, Ezra Gilbert, Leonard, John Heck, Jackson Free, knew nothing of a telephone before 1877. Then a lower grade think they heard of something or saw something; but you have to pick out the lowest grade for intelligence and education before you find one who will say he listened; or if there is here and there an exception, his dates are overturned.

Does Dr. Musser tell us what the machine was, which it is claimed Drawbaugh then showed him? What was it? Was it a string telephone? They do not identify it. Was it operated by electricity? What was the thing? They don't identify it. By and by they call the justice of the peace, who swore these *ex-parte* witnesses to their statements. He knew about the clocks and other things, but he did not know a word about the telephone, and he does not identify anything. Musser says, "It is now before me." We pointed out on the record that they did not identify it; they do not even supply this omission.

I submit that the attempt to thrust in a grossly incompetent paper, made under such circumstances, is an impropriety so great that it needs no comment. It is not as if it had been on the files of the court before the man was dead, for then we could conceive a certain propriety in it. But now it is produced to a court for the first time.

[*Intermission.*]

Mr. STORROW. May it please your Honor, if time were of no consequence, I should have liked to have read to your Honor some of the testimony of *Mr. Henry S. Rupp*, one of the partners in the faucet. The most material parts are printed in the brief (pp. 249–254), and I hope your Honor, before you get through with the case, will read it. But there is one incident that appears in the testimony of Mr. Rupp which is worth mentioning.

After we began taking testimony at Harrisburg in this case, in the spring of 1881, and while we were there, a meeting took place at the house of Mr. Gorgas, in Harrisburg. *Mr. W. R. Gorgas*, then living in Harrisburg, was one of the partners in this Faucet Company. The defendants brought there to that meeting a Mr. Hertzler, another partner, and Mr. Rupp, another partner, and the two counsel for the defence were also present. There they sat down to see what the members of the Faucet Company could do to help their friend and a neighbor in this case, for that is the amount of it. They discussed whether they could prove that he was a poor man, and whether, during the time of the Faucet Company and down to the summer of 1873, he was suffering from poverty. Without going into what is said about what took place at that meeting, let us see what they did as the result of it. They called Mr. Hertzler to prove that in 1879 he loaned Drawbaugh five dollars, and that at times before that when his children came to buy provisions, sometimes they would pay for them, and sometimes they would say, "Pa would fix it." They called Mr. W. R. Gorgas to show that at some time or other, between 1873 and 1877, Drawbaugh asked him to advance him some money about some invention, but with no pretence, direct or indirect, that it was for a telephone. They did not mention a telepone in his whole deposition. Indeed, Drawbaugh, being asked whom he applied to for aid about telephones, does not name Gorgas. See dep. of W. R. Gorgas, defts, iii, 1128; dep. of Drawbaugh, brief, 360; defts, ii, 862, 936; and for the meeting, dep. of H. S. Rupp, complts, ii, 1140.

At the meeting there was no talk about machines, and not a word about telephones. Yet, if there were three men in the universe who would have been likely to have known of the talking machine, if it had existed, they were the men. Is there any doubt about the meaning of this fact?

The deposition of *Mr. William R. Gorgas* is peculiarly significant. There had been this meeting of the three prominent members of the Faucet Company and the two counsel for the defence at Mr. Gorgas's house. Drawbaugh had been asked whom he applied to for aid, and he did not mention the Faucet Company nor any member thereof. He had put on the stand the partners Hertzler and William L. Gorgas, and did not ask them about telephones; we had put on the stand two other partners, John F. Hursh and Henry S. Rupp, and by Henry S. Rupp proved specifically and generally in the broadest manner and with the boldest assertions that no such thing as the telephone was known to that company; and that if it had existed, all needed aid could readily have been obtained. There was no doubt about the controlling importance of that fact, which then stood as a fact, unless disproved. The defendants then worked one or two years more hunting for evidence, and called two hunded and thirty-eight witnesses; and finally, on almost the last page of their record and in the fourth year of the controversy, called William R. Gorgas, and by the tenor of his deposition conclusively established the fact, which already stood established unless contradicted, that no member of that company ever heard of telephones; but yet that Drawbaugh felt at liberty, even when that company had wound up and their money been divided, to apply to at least one member of it for assistance about some invention.

This Faucet Company gave up business entirely in July, 1873, and sold out to *Hauck Brothers & Co.*, who bought out the machinery and carried on the business in that shop with tolerable vigor for one year, and with less vigor for one or two years after that. I have already referred to the Haucks and the scene when the deposition of David Hauck was taken in the matter of the faucet interference (p. 126, *supra*). We put them and their workmen on the stand, but they knew nothing of the telephone. It was not possible that they should not have known of it, if it had existed. This is not a question of mere memory. *The faucet interference testimony is a conclusive statement by Drawbaugh that no such thing was there* (brief, pp. 225, 258).

The next concern was called the *Axle Company*, which has already been referred to. Four or five of Drawbaugh's neighbors started the manufacture of a patented axle, and employed him as a foreman to get up machinery and tools, and then to superintend the manufacture of axles for them at his shop. They paid for the machinery, and he had the free use of it for his own private purposes. That began in the spring of 1875, about February or March. There were four partners. In the spring of 1876 two of them went out, and in November, 1876 another went out and then a dissolution took place, and one (Capt. Moore) took the property and agreed to pay the debts and wind up the concern, which had not been successful. These dates are fixed by the papers which the defendants' witness produced. I am going to speak more particularly of this by and by; but I will say now that no member of that company (three of them have been put on the stand by the defendants, but the fourth has not been called, for reasons which we shall see pretty plainly by and by) — no member of that company ever talked through a telephone, or tried to talk through a telephone, or was asked to talk through one, or even ever shown one that was in a condition to be talked through. For the Axle Company, see brief, pp. 259–267, 501–511.

Now, what does this all mean? In the eight or nine years after this man was said to have invented the telephone, and before he heard of Mr. Bell, there were forty people, partners and fellow workmen, in that shop; his neighbors put over $30,000 in money into that shop on the faith of his inventions, and yet he says he could not raise $50 to procure a patent for a speaking telephone. The expense is only $15 for a caveat, $15 for an application, and $20 more when the patent is issued. During all these years, among all the witnesses whom the defendants called, there is not a man, who, while he had regular business at that shop, as partner or workman, ever attempted to talk through a machine, or ever saw a complete apparatus; with two or three attempted exceptions which rather prove the rule, none of them ever heard of such a thing. What is the meaning of that? Can one overstate its importance? Can one possibly be mistaken about it? It is true that many of them have not been called, but what is the meaning of that? Some of them have been called, enough to show the current and drift of what they know. It was the defendants' business to call them; it was the defendants' business first of all to show that his associates in the shop and in business knew about it. This is what the Supreme Court said in Brady's case; and that their ignorance of it was fatal to him. There are a number of cases in the brief (one of them I have before me, but I will not stop to read it) where the Court say that if there is a disputed question of fact, and the party upon whom the burden of proof lies does not call evidence tending to support his side, and does not call those whom the nature of the case would permit, and does not call all those whose positions give them the best opportunities for knowledge, the Court must assume, and may instruct the jury, that his failure to do that is a failure to procure what Judge Nelson called a more perfect exposition, and was conclusive that there was evidence which would justify the inference, that if produced it would have been adverse to them.

Mr. HILL. To what page of your brief do you refer?

Mr. STORROW. On p. 129 of the brief, and p. 249, we have collected a number of cases upon the subject.

Mr. EDMUNDS. What case have you just referred to?

Mr. STORROW. Clifton *v.* The United States, 4 How. 242.

Mr. STORROW. One expression of Judge Nelson's in that case was: —

"It may be well presumed, if the more perfect exposition had been given, it would have laid open deficiencies and objections, which the more obscure or uncertain testimony was intended to conceal."

Standard Measuring Co. v. *Teague*, 15 Fed. Rep. 390, GRAY and LOWELL, JJ.: "It appears from the absence of testimony which would not fail to be produced if it could be found, that this invention was wholly new."

One does not need to discuss the question, when *out of forty persons employed in that shop they cannot bring a witness to prove even an attempt to talk in ten years.*

I spoke to your Honor of the string telephone. I have one here now. They can be bought on the sidewalk. When this thread is extended, and a word is spoken in this tube, the sound made in there can be transmitted. This telephone consists of a tin tube with a bladder at each end of the string.

That leads me to make one further remark about these Drawbaugh instruments, and about those tests in New York. In those tests in New York of these instruments, there were undoubtedly a good many words that got through in the course of the three days. There was one set of instruments which got through fifty or sixty words in the course of an hour or two. What does that mean? They were not Drawbaugh's old instruments, they were improved reproductions. What would it mean, supposing the old instruments had done that? If I take an apparatus and read through it a single sentence of fifteen or twenty words, and hear it all, I do not want to do any more; it is a perfectly good instrument. If I read forty sentences and get twenty words only out of them, I do not want to do anything more, I know it is worthless. It is not a question of whether, in a certain number of days, a certain number of words can be heard; but it is a question whether the instrument is reliable and practically worth anything to tell one man what another man says; in the language of the Morse patent, "for the conveyance of intelligence by electricity." Even the New York reproductions up to **D** and **E** will not do that.

I want now to go back a little and call the attention of the Court to some witnesses whom we have called. They are witnesses to whom, from their positions, Drawbaugh would have been certain to have disclosed the telephone if he had it, but who never heard of it.

One of his friends was *Mr. Andrew R. Kiefer* of Harrisburg, superintendent of telegraphs for the Pennsylvania Railroad Company. Drawbaugh knew him for a great many years. He had put up the electric fire alarm for the city of Harrisburg, and kept a little electrical-supply store in Harrisburg. He was a partner in the manufacturing firm of Hahl, Kiefer & Co., manufacturing electricians, having a factory at Washington and another at Baltimore, and employed in making apparatus for the signal service. Drawbaugh was in the habit of going to him frequently and getting electrical supplies from him, — the old parts of condemned railroad instruments, for instance, which Kiefer gave him. He talked with Kiefer about his own electrical experiments. He showed to Kiefer, at one time, an electric clock; at another time he carried in and showed to him a telegraph key which he had made, and wanted him to use it on the fire alarm. That went on year after year, from 1870 down until after Mr. Bell was heard of, but he never once said "telephone" to Mr. Kiefer. The defendants went to see Mr. Kiefer before we did; they spent two evenings with him before we ever to him. There are a number of cases in the brief (one of them I have before me, but I will not stop to read it) where the Court say that if there is a disputed question of fact, and the party upon whom the burden of proof lies does not call evidence tending to support his side, and does not call those whom the nature of the case would permit, and does not call all those whose positions give them the best opportunities for knowledge, the Court must assume, and may instruct the jury, that his failure to do that is a failure to procure what Judge Nelson called a more perfect exposition, and was conclusive that there was evidence which would justify the inference, that if produced it would have been adverse to them.

Mr. Hill. To what page of your brief do you refer?

Mr. Storrow. On p. 129 of the brief, and p. 249, we have collected a number of cases upon the subject.

Mr. Edmunds. What case have you just referred to?

Mr. Storrow. Clifton *v.* The United States, 4 How. 242.

Mr. Storrow. One expression of Judge Nelson's in that case was: —

> "It may be well presumed, if the more perfect exposition had been given, it would have laid open deficiencies and objections, which the more obscure or uncertain testimony was intended to conceal."
>
> *Standard Measuring Co.* v. *Teague*, 15 Fed. Rep. 390, Gray and Lowell, JJ.: "It appears from the absence of testimony which would not fail to be produced if it could be found, that this invention was wholly new."

One does not need to discuss the question, when *out of forty persons employed in that shop they cannot bring a witness to prove even an attempt to talk in ten years.*

I spoke to your Honor of the string telephone. I have one here now. They can be bought on the sidewalk. When this thread is extended, and a word is spoken in this tube, the sound made in there can be transmitted. This telephone consists of a tin tube with a bladder at each end of the string.

That leads me to make one further remark about these Drawbaugh instruments, and about those tests in New York. In those tests in New York of these instruments, there were undoubtedly a good many words that got through in the course of the three days. There was one set of instruments which got through fifty or sixty words in the course of an hour or two. What does that mean? They were not Drawbaugh's old instruments, they were improved reproductions. What would it mean, supposing the old instruments had done that? If I take an apparatus and read through it a single sentence of fifteen or twenty words, and hear it all, I do not want to do any more; it is a perfectly good instrument. If I read forty sentences and get twenty words only out of them, I do not want to do anything more, I know it is worthless. It is not a question of whether, in a certain number of days, a certain number of words can be heard; but it is a question whether the instrument is reliable and practically worth anything to tell one man what another man says; in the language of the Morse patent, "for the conveyance of intelligence by electricity." Even the New York reproductions up to **D** and **E** will not do that.

I want now to go back a little and call the attention of the Court to some witnesses whom we have called. They are witnesses to whom, from their positions, Drawbaugh would have been certain to have disclosed the telephone if he had it, but who never heard of it.

One of his friends was *Mr. Andrew R. Kiefer* of Harrisburg, superintendent of telegraphs for the Pennsylvania Railroad Company. Drawbaugh knew him for a great many years. He had put up the electric fire alarm for the city of Harrisburg, and kept a little electrical-supply store in Harrisburg. He was a partner in the manufacturing firm of Hahl, Kiefer & Co., manufacturing electricians, having a factory at Washington and another at Baltimore, and employed in making apparatus for the signal service. Drawbaugh was in the habit of going to him frequently and getting electrical supplies from him, — the old parts of condemned railroad instruments, for instance, which Kiefer gave him. He talked with Kiefer about his own electrical experiments. He showed to Kiefer, at one time, an electric clock; at another time he carried in and showed to him a telegraph key which he had made, and wanted him to use it on the fire alarm. That went on year after year, from 1870 down until after Mr. Bell was heard of, but he never once said "telephone" to Mr. Kiefer. The defendants went to see Mr. Kiefer before we did; they spent two evenings with him before we ever saw him, to see if they could find some recollection in his mind, but there was none. You cannot put out of the way a man of that standing. It is not a question of memory merely. If a speaking telephone had been carried to Kiefer, a railroad telegraph superintendent, a manufacturing electrician, in 1872, 1873, 1874, or 1875, no such case as this would have arisen. For Mr. Kiefer, see brief, p. 273; app. 334, 358, 426.

Again another witness, *Simon Cameron Wilson*, now mayor of Harrisburg, was long before 1870 and up to the spring of 1875 superintendent of telegraphs for the Northern Central Railroad, of which Mr. Don Cameron was president. He knew Drawbaugh in the same way. Drawbaugh used to go to see him. He had for the railroad a little repair shop for electrical apparatus, in Harrisburg. Drawbaugh used to go there and would get from him condemned instruments, coils, battery plates, and so forth, which Mr. Wilson could very properly afford to give him. He took Mr. Wilson to see his magneto telegraph key; he took his clock to show him; he went to him from time to time, and talked to him about electrical experiments, but he never showed him a telephone. Mr. Wilson was upon the stand and testified explicitly to that. That, again, is not a question of memory. Think! A man who wanted to get the attention of some intelligent person, and going month after month to men like Mr. Kiefer or Mr. Wilson and never showing them a telephone. For Mr. Wilson, see brief, p. 275; app. 334, 358, 428.

That is not all. We have assertions on Drawbaugh's behalf, repeated by witness after witness, and proving, if they prove anything, that he believed a talking machine was the greatest invention that ever was made, and that it would supersede the telegraph. One of them says that Drawbaugh's brother told him way back in 1869, "The telegraph ain't going to be nothing now no more." It is to be at once superseded by Dan's invention. (Egolf, defts, iii, surbtl, 1024). See for a collection of quotations, brief, p. 80 *et seq.*

In 1874 he went to work to make a new kind of telegraph key, to work without a battery, — an instrument consisting of a coil like this, for example; an electro-magnet erected upright on a board; and over that was placed a heavy, permanent three or four bladed steel magnet. If you move that permanent magnet you generate a current in these coils. This permanent magnet rested on trunnions, like that, and with a handle or knob put there at the back end [*designating*]. Depress that knob and you lift the front end of the permanent magnet which normally touches the electro-magnet. That suddenly pulls them apart, and in that way you generate a current, and in that way, by properly spacing these movements, you make a succession of currents and spell out the letters of the Morse alphabet of longs and shorts.

Having invented something which was to supersede the telegraph, and from his poverty being unable to make another one for sale, he invented this telegraph. He claims that he invented it. At any rate he made it. It had existed for years in better forms, and was of no practical value then (complts, ii, 1383). His great desire was (as he expressed it to somebody, or as somebody says he expressed it to him) to get a chance to try his — telephone (?) — on a real line (Eicholtz, defts, iii, 154) a mile or so long, which would convince everybody, and then everybody would want to buy his — telephone (?) — they say. One day he got a chance to try something on a real line. David Hauck, in 1874, took him to Mechanicsburg, introduced him to a telegraph operator there, and got for him permission to try — what? Why, this magneto key. This man who had superseded the telegraph by the telephone, and who only wanted a chance to try it on a real line, had also made a magneto key, and when he got the chance to try something on a real line, when he got an introduction for the purpose, he took this key up for the purpose of trying it. The key was very heavy and cumbersome, and would not work quick enough. Did he then pull out from his pocket a telephone and say, "Here is something that is going to supersede the telegraph; never mind that failure"? No, sir. He went home and made another key on a different plan; and that second one cost him more money, time, labor and materials than it would to have duplicated a dozen telephones — if he had had any. When he got that made, he put it on exhibition in a store in Harrisburg, and got his friend Lloyd to come in and see it, got Mr. Kiefer to come and see it, and asked Mr. Kiefer if it would not do to take the place of the fire alarm, and wanted him to try it, and put it on street boxes. His idea was, I suppose, to generate a current and ring an alarm at the central office. He carried Mr. Wilson to see this key. He published an advertising card, one third of which is filled with the description of this magneto-electric machine designed to be used for fire-alarm and for short-line telegraphs. For the references and quotations about the key, see brief, p. 322.

That is the man who, during all these years, they *say*, did not think of anything except a telephone, could not do any work on anything except a telephone, and was trying his best to give publicity to a telephone. But this is what he *did*. Is that positive testimony, or negative testimony? Is that something which merely gives rise to a strained inference? Why, sir, in a life filled with such things as his was, there is not a crack big enough to get a telephone into. A man whose mind was full of telephones could not come down to such things as that.

Let me go on a little further in my statement about the things he did do. I ought to say, of this testimony from Mr. Kiefer, Mr. Wilson and Mr. Hauck, about carrying this key to Mechanicsburg and trying it, and to Harrisburg and exhibiting it, that there is not a word of contradiction. They called witness after witness, but there is not a word to contradict that. Those are facts, authentic facts, ultimate facts.

A good deal was said in the answer about this man's abject poverty and want of tools. I will speak first of the tools. I need not

Bought of **DAN. DRAWBAUGH,**

PRACTICAL MACHINIST,

Small Machinery. Patent Office Models, Electric Machines &c. a specialty.

say much more than to refer to this advertisement which he published between June, 1874, and December, 1876. It was printed by Holsinger, and is of the same new type as the card. See defts, ii, 996.

He did do a great deal of electrical work for himself. The story is, that he thought of nothing and did nothing but work at telephones; and he has himself testified and asks you to believe that he never in those ten or twelve years laid aside a telephone for a moment, except for some gainful occupation to support his family, and then regretfully, and that he never thought of anything else, never had a moment to spare for any other purpose. On pages 321–2 of the brief, your Honor will find a list of things which he did make in the years 1872, 1873 and 1874, things which involved more work, more labor, than fifty or a hundred telephones. He pretends that he invented them. If he did, they required more labor and more experimenting than was involved in two hundred telephones. Let me read the list. He made three galvanometers, — pretty difficult and nice instruments to make; also an alphabet and dial telegraph, to spell out words, worked by magneto currents, — a difficult instrument to make, requiring nice work, nice adjustments, clock work, etc.; an autograph telegraph, by which you write upon a piece of tin foil with non-conducting ink, or on a piece of paper with metallic conducting ink, and by passing that through a particular electrical contrivance, there will be reproduced, at a distant station, a fac-simile of the handwriting, — an instrument requiring an extremely nice kind of work, electrical work and clock work. It is very old and of no practical use. He made this magneto key, and when that would not do he made another one. He made an automatic fire alarm, — a contrivance made of two pieces of metal, of different material, so arranged that when they are heated, as in a room by an accidental fire, they expand unequally, bending one way or the other, and thus make or break an electrical contact, start or stop a current and ring a bell — a very old invention. He made one of those.

The assertion is that he invented that or improved it. He went so far in the making of electrical contrivances that instead of buying wire wound with thread, he made a machine to wind the wire. The telephones that he pretends to have made up to that time have, I think, four magnets in all; he could have bought the wire for those magnets ready wound, ready made for use, for one twentieth of what it cost him in time and labor to make that machine; half a dollar would have been enough for all that; but he was doing so much electrical work that he made a machine to wrap his wire with. Then he made a gear-cutting machine, for cutting the gears of the electric clocks which he was making. He borrowed from a jeweller in the neighborhood a gear-cutting engine and then he made one in place of it, and when the newspaper gave an account of the one that he had made, they said it cost from $60 to $70. Perhaps it did not cost him that in money, for he made it himself. Then he made the electrical clocks, which I have described. He made clock after clock, — all of his own resources and before he got any partners in it. Think of what those clocks required! There were three or four large clocks. Brass castings were made purposely for them. They had large carved cases, one of them being seven feet high and four feet wide, of walnut. To make them he constructed a gear-cutting engine; to wind the wire with thread he invented a wrapping machine; and he says he constructed a solar transit to take the time of day by to regulate his clocks.

Can you see in that picture the man who had not the leisure, nor the money, nor the materials, nor the tools to make another set of instruments just like these telephones, and take them over to Harrisburg for exhibition and sale? He spent month after month and year after year upon those things. That is not what he did not do; those are things that he did do. Does not that drive the telephone out of his life? Does it leave any room for it?

It is worth noticing that he says that all those things were his own inventions. Is he that kind of a man? His story is that he invented the dial telegraph, the autograph telegraph, the magneto key (to be used without a battery), the fire alarm, automatic telegraph, the Giffard injector, etc., when every one of them were known, and descriptions of them published years before he touched them. And yet, he made all his neighbors believe all that stuff, and those are the same neighbors who come to testify that he made the telephone. For this see brief, pp. 320–329; and that they are all old, complts, ii, 1383.

This key is of considerable importance in the case in one respect. The defendants have one witness, a pretty intelligent man otherwise, a Capt. Moore, who says that in 1875 or 1876 (1875 he wishes to put it), Drawbaugh showed him a talking machine or something that was to be a talking machine; he says it was the tin-can B with the bladder, and that he told him it was to take the place of the fire alarm in cities. They asked him the question, "Did Drawbaugh tell you what it was for?" and he says, "Yes, that it was to take the place of fire alarms in cities." Did Drawbaugh tell you how it was to be worked. Yes, by a magnet without a battery. Well, nobody ever supposed that a telephone was to take the place of a fire alarm; but there he had in that shop at that time this contrivance, to be worked by a magnet without a battery, which he had been offering to the superintendent and the constructor of the fire alarm at Harrisburg, and asking him to use it on the fire alarm, and which he had advertised for that purpose. When you get that from one of their most intelligent witnesses, whom are you going to believe? He got them all mixed up, those babies, and he didn't know which was which. (Brief, pp. 322–5, 507; app. 209.)

Your Honor would be interested, perhaps, to know, and would hardly suspect it, if I did not tell you so, why he made those clocks and all those things. May it please your Honor, he made the clocks, — four of them, — got up a company, got a patent upon them, and went into the business of manufacturing them, for the purpose of earning money enough to patent the telephone. I will read it (defts, ii, 1114): —

> "*Q*. 1739. You have testified in effect that after unsuccessful efforts to induce different people to take a half interest in your telephone invention, and furnish the money for procuring patents and introducing it into public use, you expected other parties to go into the manufacture of the magnetic clocks, and to go into the manufacture of the improved faucets; what was your object in embarking upon the clock business and the faucet business, in 1878 and 1879?
>
> "*A*. My object was this, that I was pretty poor; I was anxious to get some party to take an interest in and run that business, to make some money by it; I was anxious also to make a raise to have money to secure my telephone improvements; I know that I often desired to have made arrangements — get a job — that I could make some money for that purpose."

Can the ridiculous go further!

One important effect, meaning and bearing of these occupations I have named is this: Witness after witness has come on the stand (I should say a majority of the defendants' witnesses) and sworn that during those years they went to Drawbaugh's shop, some of gear-cutting machine, for cutting the gears of the electric clocks which he was making. He borrowed from a jeweller in the neighborhood a gear-cutting engine and then he made one in place of it, and when the newspaper gave an account of the one that he had made, they said it cost from $60 to $70. Perhaps it did not cost him that in money, for he made it himself. Then he made the electrical clocks, which I have described. He made clock after clock, — all of his own resources and before he got any partners in it. Think of what those clocks required! There were three or four large clocks. Brass castings were made purposely for them. They had large carved cases, one of them being seven feet high and four feet wide, of walnut. To make them he constructed a gear-cutting engine; to wind the wire with thread he invented a wrapping machine; and he says he constructed a solar transit to take the time of day by to regulate his clocks.

Can you see in that picture the man who had not the leisure, nor the money, nor the materials, nor the tools to make another set of instruments just like these telephones, and take them over to Harrisburg for exhibition and sale? He spent month after month and year after year upon those things. That is not what he did not do; those are things that he did do. Does not that drive the telephone out of his life? Does it leave any room for it?

It is worth noticing that he says that all those things were his own inventions. Is he that kind of a man? His story is that he invented the dial telegraph, the autograph telegraph, the magneto key (to be used without a battery), the fire alarm, automatic telegraph, the Giffard injector, etc., when every one of them were known, and descriptions of them published years before he touched them. And yet, he made all his neighbors believe all that stuff, and those are the same neighbors who come to testify that he made the telephone. They asked him the question, "Did Drawbaugh tell you what it was for?" and he says, "Yes, that it was to take the place of fire alarms in cities." Did Drawbaugh tell you how it was to be worked. Yes, by a magnet without a battery. Well, nobody ever supposed that a telephone was to take the place of a fire alarm; but there he had in that shop at that time this contrivance, to be worked by a magnet without a battery, which he had been offering to the superintendent and the constructor of the fire alarm at Harrisburg, and asking him to use it on the fire alarm, and which he had advertised for that purpose. When you get that from one of their most intelligent witnesses, whom are you going to believe? He got them all mixed up, those babies, and he didn't know which was which. (Brief, pp. 322–5, 507; app. 209.)

Your Honor would be interested, perhaps, to know, and would hardly suspect it, if I did not tell you so, why he made those clocks and all those things. May it please your Honor, he made the clocks, — four of them, — got up a company, got a patent upon them, and went into the business of manufacturing them, for the purpose of earning money enough to patent the telephone. I will read it (defts, ii, 1114): —

> " *Q.* 1739. You have testified in effect that after unsuccessful efforts to induce different people to take a half interest in your telephone invention, and furnish the money for procuring patents and introducing it into public use, you expected other parties to go into the manufacture of the magnetic clocks, and to go into the manufacture of the improved faucets; what was your object in embarking upon the clock business and the faucet business, in 1878 and 1879?
>
> " *A.* My object was this, that I was pretty poor; I was anxious to get some party to take an interest in and run that business, to make some money by it; I was anxious also to make a raise to have money to secure my telephone improvements; I know that I often desired to have made arrangements — get a job — that I could make some money for that purpose."

Can the ridiculous go further!

One important effect, meaning and bearing of these occupations I have named is this: Witness after witness has come on the stand (I should say a majority of the defendants' witnesses) and sworn that during those years they went to Drawbaugh's shop, some of them repeatedly, and saw him always at work on talking machines, and do not recollect seeing him on anything else. Witness after witness swears to that. Is that true? Why, we know these things that he was making. What is the value of a man's testimony, when one man after another comes up on direct examination and swears he went there day after day, some of them twice a week during those years, and never saw him working at anything but talking machines. Either that is pure romance, or else they have mixed up two or three things together.

On page 331 of the brief, about twenty or thirty of them are there collected. Let me read Drawbaugh's statement (defts, ii, 864): —

"*A*. I have never abandoned it, from the earliest time of working at it. I have left it lay for a time that I was compelled to work on other work, but never abandoned it.

"*Q*. 415. For how long a time did you ever let it lie at any one time without doing anything at it in the way of study, experiment, or the making or testing of instruments?

"*A*. I could hardly say how long I left it lie at one time; it might have been, maybe, six months sometimes that I would not do any work on the machine, but I don't suppose there was a week but what I was engaged in the way of studying on it.

"*Q*. 416. Why were you compelled to let it lie at times and devote your attention to other work?

"*A*. I was compelled for the reason that I was poor. I had a large family to maintain.

"*Q*. 417. Was the maintenance of your family dependent upon your daily labor or not?

"*A*. Yes, sir; it was."

"*Q*. 424. State whether your work in inventing the electric speaking telephone, and in subsequently improving the instruments, from the time of the original cup transmitter down to the year 1879, did or did not consume a great deal of time that would otherwise have been devoted to your daily labor for the support of your family.

"[*Objected to by Mr. Storrow as leading.*]

"*A*. It did.

"*Q*. 425. Did your devotion to this telephone work during that period render it necessary to keep your family more closely — that is, more economically — than would otherwise have been the case, or not?

"[*Same objection.*]

"*A*. Yes, sir; it was necessary for me to economize. I was contracting debts which were demanded of me, and I was compelled to stop working on these machines to try and get clear of debt. I know that went very reluctantly with me, as I was anxious to work on these machines.

" *Q.* 426. Did that occur more than once or only once, that you were compelled to stop working on these machines and pay debts that were demanded of you?

" *A.* Yes, sir, often."

Never left it, except for gainful work, and then reluctantly. This is the picture of an inventor, not overdrawn, certain to be true if he had invented the telephone. Contrast it with the *facts*. They exclude all possibility. More work on this unprofitable jimcrack than on the telephone a dozen times over, whenever it was. Can you trust the man or the party who draws so false a picture?

The money part of the matter is collected, brief, 343. The actual fact proved by his own deposition, or by the testimony of witnesses called by him is, that between the spring of 1867 and the summer of 1876 he received more than $10,000 in cash; these figures foot up to $10,712.91. Besides that, were the most of his earnings as jobbing machinist. He kept a mechanic's shop, and did work for farmers on agricultural implements, made models and patterns and all sorts of things. Those he does not give us any account of, except in one or two instances, which we already knew of. He had a double house, and lived in half of it, letting the other half all the time to a good paying tenant at $110 a year. Those are some of the receipts of which we know. There is one item of $1,000, — proceeds of the Gardner note discounted. That was a note which he took on his faucet invention and discounted, and when the party whose business it was to pay it failed, it was not paid, and never has been paid by any one. It was a lien on Drawbaugh's estate; but he actually got that cash into his own hands. In another case he received $500 money borrowed in 1868. A man who could have borrowed $500 could have borrowed $75. Twelve hundred dollars was received on account of the sale of the house in 1876; about $6,000 to $7,000 of it was money which actually came to him, — fresh money, either from sales or earnings, $5,000 in money for the faucet besides the $1,000 note and $1,000 in stock, and the rest of it was money for turning property over. It is folly to say, considering the nature of this invention and the known character of inventors, that for ten years he was trying to raise $15 or $35 to patent a telephone, or that out of the money which he received he could not have paid that sum.

The defendants put him on the stand. They knew that we knew about that. We had put a good part of that money statement into our moving papers upon the motion for an injunction. They put him on the stand, not to deny that he got any money, but to say what he did with it. Certainly he did not spend it on telephones; they admit that; he spent it on all kinds of things. He could furnish a house, fix it up, and provide himself with a parlor organ and other necessaries of life; he could give $1,000 to his father to help him buy a farm in 1869, and afterwards give his father $400 to stock the farm — a very amiable thing to do. But there was a fortune coming to his family if he could get $50 with which to patent this machine. He might still have given his father $1,350. It is perfect folly to say that he could not have kept $50 out of that, or that out of all his job work during those years he could not have spared $50 to patent the telephone, if he had one.

There are two or three very interesting things in his testimony about money matters. They undertake to account for this money in various ways; they undertake to show how he paid it here and there, and to go into a very minute account. They brought in little bills of $5 and $10 that he paid, — so very minute as that were they, in order to show how he spent his money. It is very ridiculous to see the way they jumped the big things. They brought in those little bills of $5 or $10, and then had him testify that he paid, he thought, as much as $1,000 out of that money for old debts which he had contracted before the Faucet Company began. Well, $1,000 is a good deal of money; its payment would naturally leave some trace behind, some receipt, something to show for it; but he could not say where he had paid it; he had paid out a large amount of money for old debts, he said, — about $1,000 that he could not account for. We asked him to whom he paid it to; he didn't know. Then we asked him again (defts, ii, 1117): —

"X Q. 1749. In your answer to the 488th interrogatory, on p. 876, you speak of using a portion of the money you had from Hertzler and others, in payment of old debts to the amount of $1,000 or more: to whom did you make those payments?

"*A.* I don't remember to whom; I generally had a great many debts of different kinds, — store bills, and bills for flour, coal and wood, fuel — I could not just enumerate, and I could not enumerate the parties I paid it to."

He could not have been in such a very bad condition as to credit, if the storekeepers were willing to let him run up a debt of $1,000. It would have swamped all the storekeepers in the village.

"*X Q.* 1750. Can't you name any of the parties to whom you made those payments?

"*A.* I might name some, but I made payments more than once; if I have to go by the time when I got the money — I can't recollect who had the warehouse where I got my coal — Graybill & Zacharias; I know I paid them for coal; there was a party went by the name of Natcher who run the mill; I know I paid him about that time; as near as I can recollect there were store bills of parties that had stores; I paid them some money.

"*X Q.* 1751. You mean stores at Eberly's Mills?

"*A.* Yes, sir; I cannot enumerate the different bills I made."

So the only men he can name, to whom he paid that $1,000, which he received in 1867–8, were Graybill & Zacharias, for coal, and Natcher the miller. But Graybill & Zacharias did not exist until after he had received the last cent of that. He says that it was paid for old debts previously contracted; but that firm did not exist until the spring of 1869. We brought their partnership articles to prove that. Afterwards the defendants called Graybill to the stand for another purpose, but they didn't ask him about that debt. Natcher, the miller, did not move into that part of the country until 1870, and this money was received between 1867 and 1869 and paid out for old debts, so they want you to believe, contracted long before that; and all he ever paid Natcher in his life was $5.27. His whole bill to Natcher was about $14, and part of it was paid in labor. What are you going to do with that kind of an accounting? J. K. Taylor was brought on the stand; and he testified, from memory, that in the middle of the year 1867 Drawbaugh paid him some money, between $200 and $300, if he recollected right. They brought him to show that that was an old debt. It is pretty bad testimony when a man testifies fifteen years back from memory, to amounts and dates, and no papers are produced. Then *they* asked Drawbaugh (defts, ii, 1118): —

> "*Q.* 1759. Mr. John K. Taylor (on printed page 662 of defendants' record) testifies that you paid him between two and three hundred dollars, balance of an old debt that you owed him for some years, and that you made the payment in September, 1867. Do you remember whether that was out of the money that you received from the Faucet Company?
>
> "*A.* I don't remember; it may have been, I can't remember the different payments."

I will not stop to go through with it all; but two or three of them are very extraordinary statements. They are collected in our brief, pp. 344–358. I will mention one more. He told the story, on his direct examination, that in April, 1873, he, with George Kissinger, who turns out to have been storekeeper at Eberly's Mills, signed a note for $60 in favor of George Leonard; Drawbaugh thinks he had to pay that out of some money he received in July, 1873. In July, 1873, he received $425, when the Faucet Company was wound up. Certainly there was an opportunity to get $40 or $50 for the patent. He used $300 to pay off a bottom mortgage on his house — he had bought a house for $2,300 and had paid $2,000. Well, a mortgage like that does not press very hard upon anybody; perhaps the best thing he could have done when he got $300 was to pay off that bottom mortgage on his house; but it would not have been if he had had a speaking telephone. A mortgage like that does not trouble a man; the security will carry it. What did he do with the rest of the money? The Leonard note of April, 1873 for $60, was produced, and he said, as near as he could recollect, that he paid that note out of that money. Very good. That accounts for $60. They then produced another note for $103 to Leonard, which he says he paid out of some other money a couple of years later, and that he was a good deal pressed. It turned out that he owed the storekeeper, and the storekeeper and he together signed a note for about the amount that he owed the storekeeper, and Leonard, the capitalist of the village and the owner of the mill, trusting to Drawbaugh's credit, discounted this note for $60 — that is the $60 note. And here is a man who could not borrow $15 from his neighbors.

Why, his note was discounted by the money lender of the village. When that note came due, instead of bothering him for the money, Leonard loaned him some more, and the two sums together went into the note for $103. If they seriously proffer this testimony for an accounting, there has enough slipped out there to pay for a patent; yet they spent three days of his direct examination on this mass of trifling and falsities.

But that is not all. He has thus proved himself that his credit was such that the capitalist of the village was ready to discount his note on the security of his name alone, without any other security for $60. See for this, brief, p. 351.

There is another occurrence that is very touching. The defendants called Reneker, a neighboring farmer, who says that he loaned Drawbaugh $20 in May, 1877 (defts, i, 247): —

> "*Q.* 37. At the time you made that loan to him, was there any other transaction between you and him?
> "*A.* There was: he wanted to trade me a bureau and secretary combined, on provisions, such as meat, potatoes, butter, eggs and lard for his family, and we traded in that way.
> "*Q.* 38. Did he or did he not, at that time, say anything about being in want of provisions for his family?
> "*A.* He did say that he needed provisions very bad for his family."

Then Drawbaugh testified on direct examination (defts, ii, 900): —

> "*Q.* 623. Mr. Jacob H. Reneker has testified (page 247 of defendants' printed record) that in May, 1877, you wanted to trade him, and did trade him a bureau and secretary combined for provisions for your family: do you remember that transaction?
> "*A.* Yes, sir; I do.
> "*Q.* 624. Why did you trade off your bureau and secretary at that time?
> "*A.* I needed provisions for my family.
> "*Q.* 625. Had you no means to get such provisions except by trading away your household furniture?
> "*A.* No, sir; not at that time — I can't — I had no other means."

He was moving at that time from the house which he owned in Mechanicsburg, into a house which he had hired at Eberly's Mills. It took sixteen horses to haul merely his household furniture, among which were two secretary-bureaus, one that he had made and one that he had bought. Having no use for two, he put one in his house and sent the other down to his machine shop and stored it, and then sold it to a neighboring farmer and took his pay in provisions. That testimony was put in as if this fellow was in such a condition that he had to sell his household furniture for provisions, when he was simply selling his superfluities. May it please your Honor, if the telephone story is dressed up no more than that, it is like the difference between yes and no. This matter is in the brief, p. 352.

Now, I wish to come to the depositions for the defence. I ask your Honor to read those with a great deal of attention.

You cannot read those depositions, or see their value, by simply taking a statement that a man went there at such a time and saw such a thing, or heard such and such a thing; but you have got to analyze those depositions and to study them with a good deal of care to see their value. They have got to be weighed; it is not simply enough to have noses counted. We begin with rather a bad state of affairs; we begin with this fact: that more than one half of those witnesses, if they prove anything, prove that the tumbler and the tin can were perfect speaking telephones; that anybody could go and talk through them without difficulty. *There are more witnesses to those two instruments than there are to all the others put together.* More than four fifths of the witnesses are to the instruments, which I stated to your Honor yesterday, F, B, C, I, A, alleged to have been made before the close of 1874. They have to begin with that. Now, we shall find another trouble. We shall find that their own proof, when we come to analyze it, is so inconsistent, that of itself it cannot stand. I do not refer to little inconsistencies of detail, in dates and appearances. There is one inconsistency, for example, to which I will refer, and which occurred a great deal.

Drawbaugh's story is that he went on improving these instruments, making them better and better and better, and always showing the best one; I do not mean to say that he swears that he never *showed* the superseded ones, but for exhibition purposes he *used* the best one. We find the witnesses, some how or other, nearly all swear to that instrument, the tumbler F and tin can B. He has witnesses in 1876 swearing to the tumbler and the tin can; but he has not any witnesses, or at most one or two doubtful ones, to the next instrument C, which is alleged to be a great deal better, and which is apparently better, and, therefore, would be the one used as soon as he got it. Those are not inconsistencies of detail, merely. The stories which these two sets of witnesses tell cannot both be true. They may both be false; they cannot both be true.

What does the Court do when it finds that one half of a party's witnesses tell one story and the other half tell a story absurdly inconsistent with the first. Take the case that we have here to meet. They say that these things were known to everybody from 1867 to 1868 — to everybody! Suppose that you find out of their own record that the man's brother never saw one and never was spoken to about one in 1872 or 1873 or 1874; what will you do with those stories? Which are you going to believe? They cannot both be true. Is the Court in such a case to take such testimony as now suits the defendants; discard all those portions which do not now suit the defendants' desires and keep the rest? No; the Court will say, Take it all away; I have no means of telling whether any of it is true.

I have spoken of only three or four of our witnesses: Mr. Kiefer, the telegraph superintendent; Mr. Wilson, a telegraph superintendent; Mr. Weaver, a patent solicitor and an old friend of Drawbaugh's; Mr. Hauck (the one concerned in interference matter); and Mr. Rupp, Drawbaugh's partner. If there were no other witnesses in the case but these, with whom he came in contact before 1876, we should have the most perfect and absolute proof that his story was false. But, besides those we have thirty-five or forty witnesses, whom we have put on the witness stand, frequenters of his shop year after year, neighbors, men who have known him from boyhood, living along by him, knowing all the gossip of the neighborhood, and they never knew anything about it, not one of them.

The defendants have put on witness after witness, neighbors, partners and workmen, and they never knew anything of it. Now, that is not negative testimony. Think of the condition of those men. They produce a man who says, I, being at Drawbaugh's shop at a day which I assert to be at such a time, saw such and such things. How can we contradict that? We had no witness, no friend there. But we bring proof of the alleged inventor's surroundings and conduct. Courts have to rely upon such proof in such cases. It is what they most rely on. But besides that, we call a man who says that he was in Drawbaugh's shop once a week, or once a month, for three or four years, and that he never saw this, that Drawbaugh never showed it to him. Can they contradict that if not true? Drawbaugh was there every time our witnesses were at his shop, and they could have produced him to contradict them; but *they have not done it in one single instance*. That is not all. When a thing like a speaking telephone is shown to a man, he may forget the details, be unable to identify it; but the fact, if it was a fact, sticks. Perhaps one man might forget it, but not many. The trouble with men is, not that things escape the memory and nothing is left of them so that they cannot be recalled; it is that one becomes confused, that one mixes two dates, or mixes one event or one thing with another. The *illusions* of memory are the greatest troubles. Errors come from misrecollection, but not often from nonrecollection. The authorities are full of such instances. In "prior invention" cases, the courts recognize that the difficulties come from misrecollection, not from the vanishing of facts. When it comes to a question of mere detail, the man who recollects is better than the man who does not. But when it comes to a thing which affects the imagination, which rivets the attention even for a moment, it cannot be forgotten, it does not go and leave no trace, though it may leave a distorted trace. It may leave a distorted trace, but it leaves a trace of some kind. That is not all.

A man might under certain circumstances find that he does not recollect a thing, but if he ever knew of it, it will be brought back to him when his recollection is refreshed by suggestions of time, place and circumstances. The defendants have had an opportunity to do this with every one of our witnesses. Some of them might have clean forgot, but that could not have been the case with thirty or forty. About one half of these witnesses who were so called by us were witnesses whom the defendants had been to see before we saw them, and had tried to find something in their recollection. They state that they saw nothing, and Drawbaugh does not contradict them. But that is not all. Witness after witness was produced and cross-examined day after day. Why did not counsel say to the witness, "Don't you remember, Mr. Witness, that on such a day, at such a time, under such circumstances, this man Drawbaugh, sitting by my side, showed you a talking machine, and talked through it?" and then follow it up by calling Drawbaugh? Never once. There was a feeble attempt with one witness to do something of that kind, a witness whom the defendants had gone to see after we had summoned him and an hour before he was to appear upon the witness stand. It failed, and it was never tried again. Drawbaugh has not gone on the stand to say that he ever informed them; this course of conduct shows still more strongly that he knows he *did not. That he was silent about it in his intercourse with them is a proved fact*, the value of which the Supreme Court settled in Brady's case. But here we have ten times as many such associates and an invention more certain to have been communicated, if made.

Now, I go on with their witnesses. I do not propose to go through with them all, but I wish to call your Honor's attention to a dozen of them as samples.

The witnesses for the defence may be divided into two classes: those who say that, going to Drawbaugh's shop, they talked through a telephone, and heard and understood; and those who say that, going to his shop, they saw something which he said was a talking machine, but never took the trouble to talk through it.

It is only the first class which is of any considerable importance, and it is only the first class that even had an opportunity to distinguish between a machine that could talk and a machine that could not. Moreover, a man who says that he went there, whether frequently or not, and that Drawbaugh talked to him about a talking machine, but didn't talk through it, admits that it was to him a something so inconsiderable, so trifling, that it did not make any impression upon him; he cannot amount to anything as a witness to such a matter after many years.

They have forty-eight or forty-nine witnesses who say that before the date of the Bell patent they heard speech through Drawbaugh's instruments. I wish to go through the testimony of six or eight or ten of them, to show what it amounts to. They are collected in the brief, arranged by years, beginning at page 382.

Zacharias (brief, 383; app. 22) was a miller in that neighborhood. He says that at various times he has been at Drawbaugh's shop, and at times between 1869 and 1874 he went there and saw talking machines, which he says were F and B, and talked through them, and understood everything perfectly. Now, the Court knows that is not true. Then he tried to fix the date more exactly. He said it was between 1869 and 1874, and he thought it was about the time that the Haucks were making faucets. But they did not begin to make faucets until the summer of 1873. Then they asked if it might not be that some one else was making faucets about that time, and he said, "Yes," it might have been the old Faucet Company. They dismiss him after the statement that he saw this on one occasion, when he went to Drawbaugh's shop to buy a tram to level off a new set of stones which had been put into the New Cumberland Mills. Then they offered the millwright who testified from his books that he put in and set up the new mill stones between June 18 and July 3, 1869, and who recollected that at that time, while he was there, the tram was bought from Drawbaugh for the purpose of facing up these stones, and that the tram was bought between June 18 and July 3, 1869.

All this seems quite neat and logical until it turns out when the treasurer and book-keeper of the Faucet Company is called by the defendants, that instead of the tram being bought at the time stated, it was actually bought four months before, — March 17, 1869; that he did not buy one at the time stated at all. Now, what are you going to say about that? He is building his date upon an association which turns out to be false, though they have two witnesses to swear to it; the whole bottom drops out. He may just as likely have seen it at any of his visits in 1876-7-8. They would have to begin again to build up. But they did not attempt it.

Samuel Nichols (brief, 384; appendix, 69). He began by saying that he was a civil engineer; but it turned out that his profession was that of running a steam engine at $33 a month, and that he had been doing that for twenty years. He said that he lived at White Hill, about a mile from Drawbaugh's shop, in 1868, and the second summer after that he went to Drawbaugh's shop with his "son-in-law, Samuel Bruce," and that he then heard talk through a talking machine and "heard all that was said." He was asked on cross-examination how much it was that he heard and he said, "Two words," and he was asked how much his son-in-law heard, and he said, "Two words." We do not know now whether those two words were spoken. He says that he went there with "my son-in-law, Sam. Bruce"; but it turns out that Sam. Bruce did not marry this man's daughter until June, 1876, three months after our patent; and that Sam. Bruce's first wife did not die until 1875, and that he was not a visitor at the house until 1875; that he was only courting Miss Nichols three months before he married her, and that the marriage was against her father's wish. We proved these facts by calling the clergyman who married them, by producing the marriage certificate, and by Nichols's son. The clergyman knew Bruce's first wife and knew when she died, and by calling a son of this Nichols, who had been a workman in Drawbaugh's shop in 1874, we proved that there was no telephone there when he was there. Afterwards they called Bruce's widow about some other things, but they did not ask her about Bruce coming there to visit the family. Well, that is not all. Nichols described the way in which they talked, — the instrument in one room and a wire run through a partition, and across a space into another room. He said that was the way they talked from one room to another. Now, those rooms did not exist until 1875. The partitions in that shop had been changed from time to time, and the rooms did not then exist. So he went there with a son-in-law, who did not exist in 1876; and talked through partitions which did not exist until 1875.

But that is not quite all. Nichols said that before he went there he talked with George Free about this. George Free was one of their witnesses, and he don't pretend to any knowledge of this thing before 1874 (defts, i, 505, ans. 6; p. 507, ans. 17). He is a relation by marriage of Drawbaugh. Thus Nichols was one of their first-rate witnesses who fix a date and who know it. It was the second summer after he had moved to the White Hill, he said, and yet he is as wrong as wrong can be. All that was heard was two words. It was the tin can **B**. Who does that witness help? There is his date shifted; they do not call anybody to patch him up, nor do they recall him to patch himself up. The tin can as the exhibition instrument, after midsummer, 1876, and two words the best it can do!

H. K. Drawbaugh (brief, 386; app. 170), a nephew of the claimant, is another witness. You will recollect that they said that before **C** was made, and at a very early time, — 1868–9, — they got perfectly good speech through these two instruments, the tin can and the tumbler. The first thing that H. K. Drawbaugh, the nephew, proved (I am not discussing whether any of it is true) is, that in the spring of 1870, when he was there, they did not even attempt to get words through. And yet they want you to believe that those were good talking machines for three years before that.

Harmon testifies (defts, i, 575): —

> " *Q*. 11. Did he talk to you, or did you talk through those machines **F** and **B** at that time, early in 1870?
>
> " *A*. No, sir; *not in words, not at that time*."

Now, these gentlemen want your Honor to believe that it is clear beyond question that three years before that he had got an instrument which did not need any trial, caused no trouble, but talked right off. That first answer that I read of H. K. Drawbaugh has a good deal of strength in it.

> " *Q*. 11. Did he talk to you, or did you talk through those machines **F** and **B** at that time, early in 1870?
>
> " *A*. No, sir; not in words; not at that time. He used to get me to make sounds at that time, — sounds that he thought had more force or more vibration to move the instrument clearly; I remember very distinctly of playing the violin in it.
>
> " *Q*. 12. How soon after that did he talk to you through the instrument, if at all?
>
> " *A*. A very short time afterwards. There were some words that we could understand only.
>
> " *Q*. 13. Give your best idea of the time.
>
> " *A*. It was not more than ten days or two weeks; it just happened while he was experimenting with that machine; I remember that very well.
>
> " *Q*. 14. When did you go to Waynesboro, Pa., to work?
>
> " *A*. In the spring of 1872.
>
> " *Q*. 15. Prior to your going to Waynesboro to work, did you talk much or hear him talk much through the instruments?
>
> *Ans*. Yes, sir; I was about the shop then a great deal.
>
> " *Q*. 16. Were the instruments in such a condition prior to your going to Waynesboro that you could hear and understand all [illegible] as said through them, or not?

"*Ans. Just for a little while at a time; they appeared to require a great deal of adjusting and working at — merely trials that he got me to help him.*"

They want your Honor to believe that five years before that (1872) they had instruments that needed no adjusting and made no trouble and through which they could talk off whole sentences. But the first answer that I read has a good deal of truth in it with regard to that: "He used to get me to make sounds at that time, sounds that he thought had more force, or more vibration, to move the instrument clearly."

The curse of this thing when we tried it in New York was not that we could not get enough of *vibration.* Any jar, any loud voice, anything except a most careful voice made it break, and the articulation was gone. Now, that man was in such a condition of knowledge and experience, if you believe this witness, that in the spring of 1870, so far from having the remotest notion of what a transmitter was to be, and how it was to work, that, when he did not get words, *he tried sounds that had more vibration.* Why that was the very thing that he should have avoided; the very thing that Reis ran into. If he were experimenting with a Reis transmitter, that is exactly what he would do. He had not the remotest idea of the operation of an instrument such as was "reconstructed" and operated in New York. (See pp. 102–5, *supra.*)

Mrs. Mary A. Darr (appendix, 617). We called for another purpose William Darr. At one time he had lived at Eberly's Mills, and moved away from there in the beginning of 1870 or 1871. The defendants had been to him and searched his memory long before we had seen him, and found that he had no knowledge of telephones. We called him, and he testified that he had no knowledge of them. They went to see him after we had summoned him, and an hour or two before he came on the witness stand; and when they cross-examined him they asked him, "Didn't Drawbaugh tell you that the time was coming when he was going to talk across the sea? and didn't you say to him, 'You had better try the Yellowbreeches first'?" which was the name of a little stream there. Then they ask whether Drawbaugh didn't tell him that he was making a machine? Nothing of the kind, he said. Then they called his wife. They had separated from each other, his wife accusing him of drinking; but Drawbaugh, who had known him twenty years, went to get him as a witness before we saw him. Among other things she said that she knew all about the telephone, that it used to be the most common talk in her household before she moved away in 1870, and that before she moved away in 1870 the talking machine was about the only thing that was talked of; that she didn't know anything about Drawbaugh and the village since, but before she moved away it was talked about and it was said that if he could get it to work he would be the richest man in the valley. We asked her what other inventions of Drawbaugh she had heard of while living there. His clock, she said. "What had she heard of the clock while living there?" Why, she had heard that he had completed it and taken it to Harrisburg and exhibited it. Well, he completed it, and took it to Harrisburg and exhibited it *in 1878*. This woman moved away from there in 1870; yet before she moved away she had heard what he did in 1878.

George W. Drawbaugh (brief, 391; app. 197) is another witness of some importance, — a nephew of the claimant. He lived next door to his uncle. He was a wagon maker, and worked somewhat in the shop at an early time, and afterwards he worked there considerably in later years. His story is, that the first time that he ever saw any talking machine was at a date which he stated to be the spring of 1870, three years after they want your Honor to believe Drawbaugh had them, when he was repairing a certain wagon known as Sadler's wagon for Mr. Sadler. He said he could not fix exactly the date when he did it, but he thinks that was the time, and that the lumber for the wagon was bought at Lee's lumber yard. Lee was then produced, with his books, and he proved that in March, 1870, he sold George Drawbaugh some lumber, and never sold him any afterwards. That seemed to be a pretty good way of fixing the date. This wagon was painted at Daniel's shop, and George says that at that time he and his uncle were trying to talk through the tumbler **F** and the tin can **B**; that his uncle talked and then he heard, but that when he talked his uncle could not hear anything. I believe, with possibly one doubtful exception, that is the only time that George says he ever attempted to talk through a talking machine at that shop. Well, upon the question of date, it seems to be as good evidence as they ever get; the books prove that he never bought any lumber after May, 1870. Now, it turns out that *the wagon was not made until* 1871. Daniel and George were painting a hydraulic ram on that wagon. Daniel Drawbaugh and Sadler were in partnership that year on hydraulic rams, which were Drawbaugh's invention, and were going to carry them around the country. They were only in partnership one year, so Drawbaugh testifies. We have their bill for a ram which they put in in 1871. Other evidence in their record proves the date. Daniel Drawbaugh, relating the incident over again, says that he recollects well that while painting that wagon, Norman Kahney, a neighbor, came along and they had some talk. Norman Kahney was called as a witness for the defence, and said that he did not move into that part of the country until 1871. What are you going to make out of that kind of association and fixing of dates? The moment you get a fact on paper there is found to be not a word of foundation for the story they build on such associations. They are only memory; memory in the weakest and most delusive form, because self-delusive. It is the well-known fallacy of the books on logic and of the juggler — fixing the attention on an immaterial fact, while the important assertion goes unchallenged.

But that is not all. They had a witness, *Joseph Ditlow*, who testified that he lived at Milltown a good many years, that he had been a good deal in Drawbaugh's shop, but had never heard of a talking machine until George Drawbaugh told him of it in 1877. After some transaction, which, if I have time, I will refer to, the defendants brought him back upon the stand, and in answer to their question, he testified that he did first hear of it from George Drawbaugh, but he thought it was a great deal earlier than 1877, though he had not any recollection about time. Then they brought a man who said he was living in Indiana in 1870, and that this man Ditlow boarded with him in the spring of 1870 and never again (fixing that date by books), and then told him there that he had heard that Daniel Drawbaugh had a talking machine — Ditlow saying that he had heard of it from George Drawbaugh. Now all this looked very nice. But when you find that George Drawbaugh did not know of it until next year, 1871, what becomes of that house of cards? If association upon association, structure upon structure, falls, on what are you going to stand? For this see brief, pp. 375, 392; app. 198.

Henry Bayler (brief, 354, 401; app. 44) is a retired merchant, apparently a man of some means, who had carried on a lumber yard and a planing mill, at a place called New Cumberland, three miles from Drawbaugh's shop, from the spring of 1873 until into 1877. It was an old lumber yard; there had been several partners; Eberly and Lee carried it on; then Lee alone, and then Lee and Bayler. Drawbaugh had been for many years in the habit of doing their machinist work, repairing their engine, and from time to time getting lumber from them, so that there was an account between them. Bayler testified that when he went there they were fitting up their works in the spring of 1873, and Drawbaugh did considerable work for them; that while Drawbaugh was doing that work, he had invited Bayler to come up to his shop and see an invention, a curiosity, but he did not tell Bayler what it was. Bayler went there. He says that he went to Drawbaugh's shop, he thinks in June, 1873; at any rate, it was in the first half of 1873, and there talked through a tumbler and tin can and heard Drawbaugh; and that he said, "Why, Dan, that is virtually a talking telegraph; why don't you patent it?" And Drawbaugh said, "I would if I had the means. Won't you come in with me and furnish some money?" Bayler says that he thought seriously of putting in $200 or $300, but that he was not satisfied with his partner and was a little disturbed about business arrangements, and he concluded not to do it. There is one thing that is certain under these circumstances, and that is, that if Drawbaugh showed him anything, he showed him the best he had. Now their story is, that in 1873 those old instruments **F** and **B** had been superseded for two or three years by this cuspadore thing **I** and by **C**, and that the tin can **B** had gone to the attic, and that the mice had eaten out the membrane. That is Drawbaugh's explicit testimony (brief, p. 154). Yet this man says that Drawbaugh invited him to come there, and showed him that very thing, and talked well through it. The Court knows that one of these dates is wildly false, or both.

We will go a little further. We asked him, How did they talk through the telephone? Where was it arranged? He says they had a tumbler in one room, and a wire went through the partition, and across a space or entryway, into a third room, as it were, where the receiver was, and where the person listened. But no such arrangement of rooms existed until 1875. This man says he never went there but that once in his life. He says it was in 1873. He describes on direct examination, as part of the answers upon which they rely, the rooms and the partition, when those things did not exist until 1875. Now, if a man makes an error of two years such as that in his testimony as a witness, he goes over the precipice. If he went there when our patent was a year old and saw the tin can and the tumbler, what is his testimony worth?

Mr. Bayler was then asked about Drawbaugh's finances. He said that Drawbaugh was very poor; that it was very hard to get money out of him, from his personal knowledge; that Drawbaugh did work for the firm at their lumber yard on their machinery, and that he wanted to be paid in cash as fast as he did the work; that he had heard at times that Drawbaugh did not know at night where his children's breakfast was to come from in the morning; that at times they had let him have lumber on credit, but that he wanted to be paid in cash for the work that he did, and to let the lumber go on credit, and that finally the man who wound up their business in 1877 had to sue Drawbaugh. Now, what is the fact? The fact is, that these firms, Bayler's firm and its predecessors, never paid Drawbaugh one cent of cash in the world; and that on the very day when Bayler says he went there, and that Drawbaugh was anxious to obtain a patent, when it required only $15 to file a caveat on an application, the firm owed Drawbaugh $20 or $30 for work that he had done, and there never was a time for five years, including that period, that these firms did not owe Drawbaugh from $20 to $50 or $60; that he never asked for the money, but was contented to let it go on; and from time to time he took some lumber to repair his house, etc. But that is not all. The last lumber that was delivered led to a quarrel, and to some litigation, and a suit arose. They had not failed, but a quarrel arose between the partners, and the business was put into the hands of a third person to wind up their affairs; and a suit was brought, a quarrel having arisen upon some difference between this third person and Drawbaugh. In that suit Drawbaugh filed an affidavit of defence, *telling the story as I now tell it;* that he worked for them and took lumber from time to time in payment; and that at the end they still owed him $60, and that he got about $75 worth of lumber, and that he was ready to pay that difference.

Bayler was put upon the witness stand, and swore to this story of poverty, of his own knowledge, and that Drawbaugh was always collecting up close. Yet Drawbaugh had signed and sworn to that affidavit only fourteen months before. What do you make of that? Did Bayler mean to tell the Court the truth? Did he know anything about it? Did Drawbaugh keep from his counsel these things, and then help them to put upon the stand a man who swore to a story which he knew was a falsehood? But that is not all: it is not merely that this is a falsehood, — I do not know whether this wretched man is a falsifier or a romancer, or whether he has been subjected to the charms to which so many of these witnesses seem to have been subjected. But that is a further importance in this fact.

Talk about this man's poverty all those years: why, he had only to go to Bayler, a man well off, and ask him for what was owing to him — for the $20 or $30 — and he would have enough to file his caveat. Yet he wanted to persuade you that sometimes he did not know at night where his children's bread was to come from in the morning. That was during the years when he was making these electrical contrivances, — his dial telegraph, and all the other things I have mentioned. He had money in plenty for that; and there was money due to him that Bayler says he never called for. Drawbaugh only wanted $20 or $30 to secure his invention. There was a fortune in it for him if he could only patent it. In four weeks from the day Bayler says he was there, Drawbaugh received $425 in cash upon the winding up of the Faucet Company. He says that he paid $60 of that on a note, — the Leonard note, that is admittedly untrue. He also says that he spent $300 in paying off a bottom mortgage on his house. No such terrible poverty or urgent need for $50 to send to the Patent Office to get a fortune with.

But that is not all yet. He says that the tenant of his house, *Fettrow*, a blacksmith, paid him $110 per year rent. They put Fettrow on the witness stand. Fettrow said that Drawbaugh was poor; that he not only paid him his rent as it became due, but that he did more than that, that he frequently gave it to him in advance; that Drawbaugh and Drawbaugh's wife would frequently come to him and get little sums of money for provisions, etc.; that he would get produce and provisions from his customers and turn it over to them, and charge it up on account of rent. Fettrow says that sometimes at the end of the year, when they settled, he would find that he had overpaid his rent; that sometimes the balance would be one way and sometimes the other. They asked Fettrow to put in his account, showing everything that he did pay Drawbaugh, and he did so. *The accounts do not tell the same story.* From them it appears that there never was a year when Fettrow paid his rent in advance. There was not a time according to his own accounts (which the defendants have printed in their exhibits), there was not a year, in all these years, when the balance at the end of the year was not in Drawbaugh's favor, of from $20 to $60. If he had been so poor as it is pretended, so poor that he did not know where to get food for his family, here was his prompt-paying tenant, ready to advance him the rent faster than it was due, and he could have gone to him and got money at any time. What do you understand by that kind of story? Drawbaugh produced Fettrow to swear to that which was untrue. His own accounts show that his statement is untrue. Why, this case seems to have been presented with that recklessness which ordinarily belongs to this kind of speculation.

Not only that. Fettrow's accounts were put in evidence. The drift of his testimony was that his advances to Drawbaugh were in money or necessaries for his family. That is not true. You have all the items, but a very small part were advances in the way of money or provisions. The bulk of the items were for blacksmith's work for Drawbaugh's customers. He was doing blacksmith work for Drawbaugh, and Drawbaugh was doing machinist's work for him. When he did blacksmith's work for Drawbaugh and charged it to him, of course Drawbaugh got it out of his customers in return. For this Fettrow matter, see our brief, p. 356; app. 100.

Holsinger is another important witness. He was the printer who wrote too many articles for the newspapers for the good of his cause, Of him I have spoken already.

Of *Dr. Moffitt* (brief, 415; app. 143) I also spoke this morning or yesterday. He was a dentist in Harrisburg who went frequently to Drawbaugh's shop, partly for the trout fishing in the vicinity, and partly because of the interest which he took in Drawbaugh's numerous inventions, having known Drawbaugh for twenty years. The story that he tells is that he went to Drawbaugh's shop at one time in the summer of 1873, and there saw a talking machine. He says that he was led there partly by "the interest he took in the various and numerous inventions that Daniel Drawbaugh was experimenting on" (defts, i, 516).

Then we asked him to look at his fourth answer, and to state what were the inventions there referred to; and he answered (p. 522): —

> "Various inventions, I could not state which ones; I was interested in almost any mechanical pursuit the man was working at, being inclined that way myself to some extent."

Of course he would know about telephones there as soon as anybody would know. His story is that he was a visitor to Drawbaugh's shop from some time before 1870, and that he first saw a talking machine there at a date which he says was in the summer of 1873. I will not now discuss whether that statement is true or not; but this friend, interested in his inventions, a frequenter of his shop, never saw one before 1873; and yet the defendants would have your Honor believe that everybody in the community knew six years before that he had this machine in his shop. I will read from his testimony, at page 415 of our brief (defts, i, 517): —

> "*Q.* 13. Do you remember whether Mr. Drawbaugh talked through the instruments at that time?
>
> "*A.* I can't give any definite time when he talked through any of these instruments, whether it was the first time or a short time after; the first time that he talked through them to me was shortly after I had any knowledge of his having a talking machine, when he handed me an instrument similar to this (indicating A), which he directed me to place to my ear, stating that he would go down stairs, or in some other part of the building, and that I should listen. He went, and I heard Mr. Drawbaugh's voice asking me if I heard him talk. 'Do you hear me talk?' was the way he put it. I was surprised, and I looked around, expecting to find Mr. Drawbaugh

behind me, but did not find him. He came in presently, and attempted to explain to me the principle on which the machine operated; I did not understand his explanation; he alluded to the vibration of a bee's wing to illustrate how the diaphragm operated to produce the sound; that is about all that I remember distinctly on that occasion. There was a great deal more said that I do not remember."

Now your Honor, knowing the best that was got from that instrument by the tests in New York, can appreciate the value of such a piece of testimony as that. But that is not all. If the defendants' record proves anything, it proves that that instrument **A** was not made at that time. I think that I have mentioned the impossibility of believing that such a thing existed in the shop of Drawbaugh for six years before this person knew anything about it. He is the man, judging from his own statements, who thought in 1878 that it was no use to go into the telephone business, because Drawbaugh could not antedate Bell. But now he is produced to prove that he always knew of his own personal knowledge that Drawbaugh was years ahead of Bell. He is, I think, on the whole, the most intelligent man of all the witnesses who pretended to have ever listened at one of Drawbaugh's instruments; and that is his testimony with regard to it. What is the value of the less intelligent class?

William H. Zearing is another witness whom I want to refer to (brief, 419; app. 626). He was a witness brought in in the fourth year of the case. He was a neighbor, and there is no reason why his testimony should not have been brought in before. He was secretary of the school board, a fairly intelligent man. He says that he went to Drawbaugh's shop in 1873, 1876 and 1877. Of course the important question is at which of his visits it was that he saw the instrument. He says that the instrument which he saw, and which he heard speech through, was exhibit **I**. He is going to fix just when it was. He states that on Nov. 25, 1873, he went to Drawbaugh's shop in order to get a pair of steelyards repaired. He had a funny experience to begin with. This man Drawbaugh, according to his present statement, was so busy making telephones that he could not stop for anything else. And he never got any work, and he was out of work all the time. But Zearing went there in the fall of 1873 to get his steelyards repaired; and Drawbaugh said that he was so busy that he could not do it, that it would be a fortnight before he could do the job, though it only came to thirty-five cents; that he would have to do it after night, as he had *other work promised*.

In the same year, Hauck was carrying on the business of manufacturing faucets, and Hauck wanted Drawbaugh to work for him, and said that he would give him his own price per day or by the job. Drawbaugh refused, stating that he had so much work to do for other people that he could not (brief, p. 358).

Zearing has an entry in his account book to the effect that on Nov. 25, 1873, he got his steelyards repaired; and he knows that it was at this time that he heard the speaking telephone, because one of the things which he heard through the machine was, "The steelyards are finished." If so, there can be no doubt about the date. He was asked how things were arranged. His testimony was that the receiving instrument was lying on the *middle* of the table, and that he was *standing* up close to the table. Why, he might as well have been in the next township. It is physically impossible that he could have heard speech through it as he testifies, as much so as to make my voice heard in Kamschatka. It is absolutely, ludicrously impossible. He could not have heard with the instrument lying on the table as he states it was. Think for a moment of these tests which were made in New York by Mr. Benjamin; shut up in a tight closet with the receiver at his ear, yet unable to hear a single sentence. Yet this witness says that while he was standing up by the table on which the instrument was lying he was able to hear distinctly the words, "The steelyards are ready." We have specifically proved that it is impossible (complts, ii, 1377).

Jesse Eicholtz (brief, 421; app. 629). He was a miller, living in the neighborhood, five or six miles away from Drawbaugh's. He says that he went to Drawbaugh's shop on the 13th of November, 1873, to get a piece of machinery that Drawbaugh was making for him; and he knows that it was on that day, because he has an entry in his book about the machinery. His wife went with him. They talked through the talking machine, and heard and understood perfectly well. Well, he got into one little trouble. In giving his direct testimony in describing his visit, he said that when he and his wife drove away on that day, "John Teahl rode along with me that day from Teahl's mill, where he was milling at the time." Now, the fact is that John Teahl had sold his mill two and a half years before, and had moved away from that part of the country. Not only had he quit milling, but he had left the country, and did not live anywhere near there. This man's power of association does not seem to be first rate. His deposition proves as absolute impossibility just as readily as it proves the existence of the telephone. On cross-examination we were able to get from him some further particulars. He said that when they first talked, the machinery was not running, that afterwards Drawbaugh started the wheel and the machinery to satisfy them that they could hear perfectly well in spite of the noise, and that they did. That was certainly a recommendation for that instrument. That cannot be done now. In their tests with the instrument in New York, there were horse-cars in the middle of a wide street, and the listener shut up in a closet in the middle of a building, but a passing horse-car sometimes drowned the voice. Then we asked the witness whether he told the defendants' counsel this little anecdote about starting up the mill. "Yes." But they did not bring it out. It was a little too strong for them, I presume.

Mrs. Eicholtz went on the stand to sustain her husband's testimony. When she came to be cross-examined, we asked her whether she had ever heard any talk about the machine before she went there, and she answered, "Yes; her husband talked about it; he had been there before." It looked rather curious that the defendants did not ask the husband about the other visit. So they had to recall the husband for that purpose. He said, "Yes, he had been there in 1871, and talked through the machine and understood." Had he told defendants' counsel of this earlier visit? Yes. But they had not brought it out. By and by he said, just as he was leaving the witness stand (defts, iii, 162): —

> "As to that first visit, I would say that that first talking machine was entirely different from the second. The first consisted of a tin can and a glass tumbler. They were connected by a string; if I mistake not, it was a string instead of a wire. The second was connected by wire. That is my recollection; but it has been so long since that I wouldn't positively swear that it was a string or a wire, but I think it was a string."

The pair of telephones he saw in 1871 *were connected by a string.* He is not perfectly positive of that, but that is his recollection. If that is his recollection and his testimony, then which side is he on? Do you want to keep one part of his deposition, and not the other? Do you want the 1873 part, and not the 1871 part? What will you do with it?

There is more about this string-telephone business. One of their witnesses, *David M. Ditlow,* said that he went there in 1873 or 1874, and talked through an instrument. What was it? He said it was composed of two tin tubes with bladders over them. The tin tubes, at the end of which were the bladder, was connected by wire, wrapped with string. Then Drawbaugh testified that he thought the witness had meant to refer to the tin can **B**. But **B** is not the telephone which the witness describes. What is the trouble? Has he mistaken another instrument for that? The witness did not think he had. He testified that he had looked at the exhibits in the case, but could not recognize it. It was not because he had forgotten what he had seen, but because what he had seen is not among the exhibits produced. (Brief, p. 313; app. 187.)

Again in the course of the case, we called, for another purpose, a witness by the name of *Eppler;* we did not call him about telephones, but merely to prove the date of a collateral matter. The defendants had been to see him before we had seen him. They had talked with him about telephones before we saw him the first time, to learn if he had any knowledge on the subject. He was not a man whose residence or position naturally gave him any knowledge, as he lived some miles away. They had been to see him; they talked with him. Their counsel went to see him twice after we had seen him. Both parties had been to see him several times. We put him on the stand and had him swear to other matters, for the purpose of fixing another date. Then the defendants asked him whether he did not tell the complainants that he had been to Eberly's Mills, and to the shop there, and had seen a telephone or talking machine there; and whether the man at the shop was not Drawbaugh, and whether he did not tell the complainants' counsel all about this. Had he not only told the complainants this story, so that the complainants knew of it and were apprised of it; but had he not told the defendants so that they knew it, and had he not told them that he visited the village in 1872 or 1873, and then saw this talking machine. He said that he told them about it, but had not told them that it was in 1872; that he had not told them that he was there in 1872; that he told them he did not *know* positively when it was, but that his recollection was that it was in 1873 or 1874. They kept putting it in their questions whether it was not 1872–73.

To make a short story of it, — not altogether creditable to us, *if true*, — they created an appearance as if we had one witness who had been there at Eberly's Mills in 1873, and had seen a talking machine. We knew the truth, and so when we came to re-examine him we asked him the question and developed this state of facts. That he did go there at some time or other, that he went to a wagon maker's shop, not Daniel Drawbaugh's shop, but to that of his brother, John Drawbaugh, and *that what he saw there was a string telephone*, and that *he went home and made one like it*. Now that is a pretty important fact in this case. The defendants put it in. They made him their witness when they began to examine him about it. They brought it out, *but with a false color*. They had talked with him, and knew what he was to say. Moreover, they knew all the actual facts, as we did not. This took place at the shop of their own witness, their man's brother, across the road from their man's house, in that village, and they put in as a fact that this witness went there at some time in 1872, 1873 or 1874, and saw a talking machine there in that village; but it *turns out to have been a string telephone. They did not call John Drawbaugh, in whose shop they saw it, to deny or dispute this statement or to contradict Eppler, and there his testimony stands.* Now, when we find that their witness Eicholtz says that when he went there it was a string telephone, according to his recollection; when *they* say, and ask the Court to believe, that Eppler saw a talking machine, that there was an instrument there in 1872–3, and it turns out to have been only a string telephone, — *and they know what the fact is and do not contradict this*, — then there is a good deal of help towards an understanding of the case. For this string-telephone matter, see brief, p. 311.

H. B. Musser (brief, 424; app. 87). He is a farmer of the neighborhood, and as intelligent as those farmers ordinarily are. He says that he went to Drawbaugh's shop in the summer, in the last of June, 1874, to get some repairs to his mower. He fixes the dates very exactly. He went again in the summer of 1876 to get his mower repaired; he went again in 1877 for the same purpose. He says that upon two of these occasions he saw the talking machine, and had talks through it. It is pretty material to know when this was. If it was in the summers of 1876 and 1877, then his testimony is not very troublesome. He swears that in June, 1874, he saw the tumbler **F**, and tin can **B**, and talked through them, and heard perfectly well. He says that in 1876 he saw the two little magnetos **D** and **E**, and talked through them. Whether he saw telephones on the first or second or third visit, at each of which he had the reaper repaired, is a matter of mere memory. On direct examination he undertook to state how the instruments were arranged, not in the same room, but one instrument in one room, with a wire running through two partitions and an intervening entry way to a receiver in another room. I asked him to draw a plan of the way the rooms were arranged, and he did it. Between the two rooms, as indicated in the plan which he drew, there is an entry way six feet wide. The first arrangement of partitions which had an entry way between the two rooms did not exist until 1875, and remained until 1878. It is certain, therefore, that his visit was not until after 1875. He made no visits between June, 1874, and June, 1876; thus the most he can prove is that the tumbler and tin can were the best instruments in the summer of 1876, — then, or at some time after that, for when once his association is broken, there is nothing to anchor to.

But that is not all. The witness undertook to describe the clocks that he saw there. We know when the clocks were made, from Drawbaugh's statement and from the testimony of his own witnesses. Musser says that he then saw these fine clocks, *which did not exist until* 1877 *or* 1878; he says that he saw them at the same visit when he saw the talking machine **F** and **B**, which he talked through.

W. H. Decker (brief, 425; app. 251) says that he went to Drawbaugh's shop in 1873, 1874, 1875 and 1877, and that he saw these instruments. He says that the shop was lined with them. It may be that they were not all talking machines, but, according to his story, he there saw more talking machines than all the exhibits put together would number. His testimony, if your Honor pays any attention to it, must be read and examined pretty thoroughly. I will not stop to do that now, and will state only one thing in connection with it. He says that he went there and talked through this contrivance in the summer of 1874; but he made a mistake, and rather a serious mistake. He says that in the summer of 1874 the instrument that he talked through was exhibit **D**. Now, there is no pretence that **D** was then made; on the contrary, the defendants expressly assert that it was not. This date, therefore, was too early. He had desired to fix the time early enough, but he fixed it too early. Next he says that in August, 1875, he saw and had a conversation through one of the machines; and as to this he testifies (defts, ii, 1155): —

> "*Q.* 33. State what you remember of it.
>
> "*A.* 'How is my old friend Jacob May and his family?' he says. I said, 'They were all well when I last saw them.' He says, 'I understand there is an increase in the family.' I told him I wasn't positive of that, and couldn't give him no positive answer. He says, 'Well, they are all well, so far as you know?' I said, 'Yes, sir.' He said, 'I am much obliged.'"

That increase did not happen until a year afterwards. There was no increase between March, 1872, and August, 1876, when the event which they inquired about happened. We called Mr. May, and by him proved that fact.

I beg your Honor to understand that if I do not go through all this testimony, it is because life is not long enough, and not because I think it of no importance to examine it.

Urias R. Nichols (brief, 429; app. 27) is rather an interesting witness. He was a soldier. He had been a machinist. He was in the signal service at one time. At another time he was assistant keeper of a lighthouse. He is a farmer at the present time, and has been for a number of years. He says that he went to Drawbaugh's shop in January, 1875, and that he then saw this instrument, exhibit **A**, and heard and understood what was said through it; that it repeated speech perfectly; that it was a perfectly admirable thing. He says that the boy who was talking with him through the instrument was Drawbaugh's boy, as nearly as he could make out; that he called Drawbaugh "father." Now, Drawbaugh's oldest boy was only eight years old at this time, rather small to take one of these instruments which have baffled the experts in New York, and talk whole sentences through it. Nichols came there, according to his statement, in January, 1875, and the date he gave appeared to fit in first rate with other circumstances. Just before him they called D. W. Smith, who testified that he was in Drawbaugh's shop in November, 1874, and that Drawbaugh was then making this instrument, exhibit A. Nichols says that when he went there in January, 1875, he saw this same instrument, and says that Drawbaugh told him that it was about sixty days old. Thus the statement of Smith that he was in Drawbaugh's shop in November, 1874, and saw him making this instrument, and the statement of Nichols that he was there and saw it in use in January, and was then told that it was about sixty days old, fit in as nicely as possible. Nichols apparently fixes the date exactly, and says that he knows that that was the time, because he came to Harrisburg to see a member of the Legislature about some business. Then he says that he knows that was the date, because he then bought some lime at Hake's lime kiln in that vicinity. His way to and from the lime kiln was by Drawbaugh's shop. He remembers that he bought some lime, and said that he had a memorandum at home showing that it was delivered on the 18th of January, 1875. He forgot to bring the memorandum with him, but he had no doubt about it.

We called Hake's lime burner, Henry Kintz, and he brought his books. He was the lime burner at Hake's for many years, and up to April, 1876, and sold all the lime; and he proved that he never sold that man a pound of lime. They did not call Nichols back to explain that, nor to produce the "left at home" memorandum.

On cross-examination we asked Nichols what he went there for. He replied that he went there to see the clocks. He said that he had read about them in a Harrisburg newspaper of two or three months before, and read that they were run by electricity from the earth, and required no winding. The defendants tried to get him to back out of that, for *no such account was contained in any Harrisburg newspaper, or in any other paper, until January*, 1878. He then said that possibly it might not have been a Harrisburg newspaper, but that he was pretty positive that it was, because he did not read any other. But the first account of the clocks in the Harrisburg newspaper, as I have stated, was in February, 1878; and this man says that he never was in Drawbaugh's shop but once.

He was then asked, on cross-examination, who he told about it when he went away; and he said that he mentioned it to Col. Maish, a lawyer of York and a member of Congress. Col. Maish says that Nichols did tell him that he had seen a telephone and an electric clock at Drawbaugh's, but also testified that he had previously talked through a Bell telephone in Washington, with Mr. Robeson and Mr. Blaine, in the fall of 1877. They did not call Nichols back to explain that discrepancy.

What do you make out of that story? There is no doubt about the time that he went there. We fix that absolutely as the spring of 1878. He swears that this telephone **A** was then about sixty days old. That fact is an end of the case, if it be a fact, for **D** and **E** were made after **A**. What will you do about the man's testimony? If he is worth anything as a witness, if he is not a liar, if he has not been stuffed up with this story, the dates and circumstances of which fit together so nicely, then what explanation can you give? Did such a thing take place? Drawbaugh put him on the stand, and he swore that Drawbaugh told him that that thing was then sixty days old. Now that we know the true date of that visit, what reply can you make to that? They have not called him back; they have offered no explanation of the testimony. What then will you do about it? That witness did not make a mistake. A misconception is not conceivable. He says that he was told that the instrument was then sixty days old. A man would not imagine such a statement as that unless it were true, or unless it were said to him, had been told to him, and stuffed into him. I don't care which horn of the dilemma they take. One is fatal to their case, and the other is fatal to their character.

Updegraff (brief, 432; app. 247) is the next fellow I want to call your attention to. He says that he went there twice in the spring of 1875, and heard through a talking instrument; but he cannot identify which one it was. He says that he went there twice about a month apart, in the spring of 1875, and that he never was there after that time. Updegraff is a quack doctor. At that time he was an oculist; at the present time when he testified, he was selling seashells; between times he had made hats and magic lanterns. He never was there after that spring he says. He was there in 1874, also, he said. He fixes the time by saying that he went to visit a patient; and that he had the charge for it in his book; he meant to have brought the book but he forgot it. He lived in Philadelphia, and came up from Philadelphia to Harrisburg to testify.

It turned out on cross-examination that defendants' counsel had seen his book and had examined it a half dozen times. It looked rather curious after that that it should not be produced. I do not mean to cast any imputation upon the counsel, but it certainly rather shook the value of the testimony of this witness that under such circumstances it was not produced. Then he said that he could fix the time by the horse that he hired at a livery stable; that he had asked the livery-stable keeper to look at his book, and that he had done so, and had told him that it was in 1875. But they did not produce the book or call the livery-stable keeper, nor any witness to testify who had seen the book; Updegraff had not seen it. Well, that testimony looked pretty weak under those circumstances. Then he said that on that expedition they went to Zacharias's Mill and went fishing in the stream, and that Zacharias's Mill was four or five miles above Eberly's Mills, where Drawbaugh's shop was. He rather thought that Zacharias did not own the mill, but was the miller. He says that they camped there the first night. "The next day they put their boat in the river and floated down to Eberly's Mills. They pitched their tent on a little island at Eberly's Mills in the creek, and fished there till evening." He says that in the evening he went into the shop and talked through the talking machine.

He says that he only knows that Zacharias was the man who ran the mill a few miles above Drawbaugh's, or attended to it. Now, that man Zacharias was called as a witness, and he swore that he did not go to that mill until 1876. What will you do about that? But that is not all. The companion of this man, a person by the name of John T. Smith, was brought to support him. He testified in the same way, but a little more fully. He says that in the morning, after sleeping there that night, he went up to the village grocery store and bought some coffee, and something to eat for breakfast, and then came back and had breakfast. Now, it has been brought out by the defendants in their evidence, that that village store was blown up by an explosion of gunpowder in January, 1875, and was not rebuilt until the autumn of 1875, and that there was no store there in the spring of 1875. One gets a good deal perplexed by such testimony. One fails to place any reliance on that sort of testimony from that sort of witnesses. If you had them piled up as high as the court room would hold, it would not make that perfect freedom from every reasonable doubt which must be resolved against the claimant — that freedom from inconsistency — and which is required in this case more than in any which was ever heard of, to make your Honor believe that **F** and **B**, the tumbler and the tin can, gave perfect speech. That is the problem the defendants have got before them.

I do not mean to say that all their witnesses are of that kind, but lots of them are. But I have not gone through with all. Suppose you found one in ten or one in five of that class: what will you say about the rest? The happy accident that we got from Nichols the statement that he went there to see the clock in consequence of reading of it in the newspapers, settled his business. It was a mere accident that he made that statement which disproved his evidence. How can you know whom to believe? How can you place any confidence in the testimony of witnesses who are contradicted in that way; or how can you place any confidence in testimony as to dates, which exist only in the memory of the witnesses. It is all memory, memory, memory, — not a paper, not a line, before our patent, *except the advertising card.*

Abraham Fisher (brief, 373; app. 233) is another witness who is produced, a pretty interesting and rather an important one. He did not hear Drawbaugh speak through a machine. He says that he went there twice: the second visit is the important one. He went there in the summer of 1873; he is sure that that is the time, and that Drawbaugh then showed an instrument. He is not perfectly positive that this **A** is the instrument, but he has no doubt about it. This is fixing the date pretty early; for the instrument did not exist, according to their story, at that time.

Possibly they may try to stretch it back to that time chiefly by this witness, but that is not the tenor of their depositions. Fisher knew that was the time, because he bought a hydraulic ram at that time, and had an entry at home and had looked at the entry the night before he came, but he too had forgotten to bring the paper with him. But it so happened that afterwards we find in the faucet interference case that Drawbaugh had produced a memorandum book, and part of it was copied into the faucet interference, and in that book was an entry of a charge to Fisher of $63.57, under date of June 7, 1873, for this very hydraulic ram; and Drawbaugh testified in that case that that was an entry for a ram sold to Fisher, and that the entry was made at the time he sold it. When Drawbaugh was on the stand on cross-examination, we asked him if Fisher had bought two rams. No, only one ram, and Fisher was wrong in his date; and it was in June, 1873, when he sold him the ram. Fisher had said that he had fixed the date by an entry which he had at home; and so we wrote to Fisher and asked him to send us a copy of the memorandum which he had; he did not send it, but he said that it was all right. And he was sure about the date; he had talked it over with his folks. We wrote again, but he would not send a copy of the memorandum, but said he had talked it over again with his folks, and that it was in 1874; of that he was sure. Well, things began to look very curious. After Drawbaugh had testified to this, and had, by his own written memorandum, made by himself at the time, shoved the ram over to 1873, it began to look bad for Fisher. So they called Fisher back again, and he said in substance, "Yes, it was in 1873, come to look it over, that I was there. My memorandum was not a memorandum as to the purchase of the ram, but my recollection was that I bought the ram at the time that Jacobs worked for me, and Jacobs worked for me, according to my books, in 1874. When I got complainants' counsel's letter, I looked it over and talked it over with my neighbor. He said, 'That ram was put in when Jacobs worked for you,' and Jacobs worked for me in 1874."

Another neighbor said, "I put in the pipe for that ram, and I know I quarried stone for Abraham Smith in 1874, and it appears to me it was the year before"; and another said, "he knew it was in 1873, because it was a year before he lived in such a house," and Fisher talked to his wife about it, and she says, 'Don't you remember

Jacobs's family worked for us two years in 1873 and 1874 both?" So Fisher remembered that, and then remembered that in 1873 he paid them every Saturday night and kept no account of it on his books. Just so.

Now, I want to read to your Honor an authority which bears on a case like this. There was a case of *Woodman* v. *Stimpson* (3 Fish. 98), before Judge Lowell, and a witness in that case undertook to settle a question of date, as between 1860 and 1861, by association with some event. Either it was 1860 years after the Christian era, or it was some other event. In that case Judge Lowell, with his grim sense of humor, said (p. 10): —

> "The value of these aids to recollection depends upon two or three circumstances; on the importance of the event itself, primarily, and next on the closeness of its connection or association with the fact it is adduced to support. If Mr. Perkins tells you, 'I enlisted at such a time, and I did this job immediately before I went,' there is a natural connection between the events, and he would be likely to remember them. If he went to the war, and knew that he did this job just before he went, he would be pretty likely to remember it. If he had not been to the war, and had been doing jobs for the defendant all along, it would be difficult for him to recollect in what year he did do it. You ask a farmer in what year he saw a new plough which his neighbor was using, but which he did not think much of, and which he did not think worth while to buy. His neighbor is dead now, and you want to know when that plough was first used. Well, he thinks it was the year he had a certain field sowed with rye. His wife thinks it was the year he had it sowed with barley. His head man thinks it was the year he had it sowed with clover. They talk it over and finally settle that it was the barley year; they do not recollect the time, but that is the best they can do, and you have to take it with that qualification."

What weight can we give to the testimony of witnesses as to dates which are fixed by such associations? And especially after these matters have been talked over by the witnesses amongst themselves in the way in which it has been done in this case? Why, sir, this case and this testimony are the interest and the talk of that whole community. The people in that little village of seventy-five inhabitants are talking of this case and of nothing else. They sit around in the evenings at the grocery store, and the post-office, and they talk about it. They finally agree as to certain dates and facts.

They say, "This thing was done about so; and if we can get the Court to ratify the action of this caucus, it will be a pretty good thing for our neighbor Drawbaugh. If he can get $500,000 to bring to this village, we would like him to do it. He is a good fellow whose money does not stick by him, and we would like to do him a good turn. It is, therefore, the opinion of this caucus that he had a talking machine, and that we all knew of it, and understood all about it perfectly well."

They called one witness of a different stamp. That was *Prof. S. B. Heiges* (brief, 270; app. 622). I wish they had two or three like him. It would save us much trouble in arguing this case. Prof. Heiges is now the principal of the State Normal School at Shippensburg, twenty or thirty miles from Eberly's Mills. He was formerly professor of physics in the academy at York; and was also the superintendent of public instruction in the county of York. At one time, about 1859, he taught school at Eberly's Mills. He not only taught school during the day, but in the evening he had a class to which he gave instruction in physics, especially in electricity and magnetism, by lectures and experiments. Mr. Drawbaugh attended those lectures with a good deal of interest, and Heiges and Drawbaugh talked a good deal about these things. Drawbaugh told him that a clock could be made which would run by means of magnetic currents from the earth, and without winding. This is what Heiges says. He might have told him that it had been made ten or a dozen years before, and was a perfectly well-known thing.

It is a little doubtful, however, whether Drawbaugh did tell him that. For, when you look at Drawbaugh's cross-examination, you will see that when he speaks about a clock which could be run by electrical currents from the earth, and without an ordinary battery, it seems to me that the meaning is that that plan had occurred to him in consequence of some previous experiments in swinging a pendulum by a battery, which were made in 1867 that is the year when he moved his shop (defts, ii, p. 938, x 828); and it appears to me that Prof. Heiges got two things mixed up, — some old talk about something else with Drawbaugh's clock of a much later period, — and that he has blended subsequently acquired information with prior knowledge. He says that Drawbaugh told him at that time that the time would come when they would talk by telegraph, though he did not tell him how. It was nothing remarkable to say that.

Mr. Heiges says that the next time he went to Drawbaugh's shop, after this, Drawbaugh showed him an instrument. The date of this he does not exactly fix, but the circumstances he names are intended to point to July, 1872. He says that he was then staying with his father-in-law at Shiremanstown, about three or four miles from Drawbaugh's shop; and that he went one day while he was staying there, with his brother-in-law, Dr. Mosser, down to Drawbaugh's shop. Dr. Mosser was a partner with Drawbaugh in the Faucet Company. Dr. Mosser and he went down one Sunday forenoon to find Drawbaugh, and have a talk about faucets; and they were there three quarters of an hour talking about them, and while there, Mr. Heiges was looking around the shop, not taking any particular part in the talk. Just as they were coming out — so Prof. Heiges says — something was said about the telephone, and Prof. Heiges saw something which he thinks was the instrument **C**. It does not appear whether Heiges first asked what it was, or whether Drawbaugh first called his attention to it; but the consequence of what was said was that Prof. Heiges took into his hand something which he says is **C**; he says that Drawbaugh said that it was a talking machine. But let me read to you his testimony about it (defts, iii, surrbtl, 99): —

> " *Q.* While you were there at Mr. Drawbaugh's shop with Dr. Mosser on that occasion, did Mr. Drawbaugh say anything to you about an invention of his; and if so, what invention?
>
> " *A.* Yes, sir; he spoke of and exhibited to me his talking machine, as he called it."

Now, that man ought to be a very important witness. If there is anything in this business, he is the man to find it out, and he will know everything about it, — how the machine talks, and the whole operation. He is the only man who ever went into that shop with the education — intellectual capacity — to understand the mode of operation and the structure of this thing. He ought to know everything about it.

> " *Q.* 31. Did he talk through it to you?
>
> " *A.* No, sir.

" *Q.* 32. Did he, at that time, make any statement to you about it having been talked through by himself or others, or not?

" *A.* He did, and said that he had talked through it, and some other parties had."

The machine which they had in there when that conversation was going on is this machine, exhibit **C**, which, with possibly one exception no witness in the case testifies to the use of. Not a witness testifies to any knowledge of any attempt to use that instrument before the day when this man says that he went there. So that part of the story is not true. There is something mixed up there.

" *Q.* 33. Did he say whether or not, when he and others had talked through it, it had operated so that the talk could be heard through it?

"[*Objected to, etc.*]

"*A.* Yes, sir, he did; he said that it had so operated."

This man is a professor of physics, and yet they have to lead him like an infant.

" *Q.* 34. Will you please look at the machines now shown you, marked **A**, **B**, **C**, **F** and **I**, and state whether you recognize among them anything that you saw at Mr. Drawbaugh's shop, at the visit when you and Dr. Mosser were there together?

" *A.* This is one that I saw [*taking up instrument* **C**].

" *Q.* 35. How long, on that occasion, did Mr. Drawbaugh talk to you about his talking-machine invention?

" *A.* I suppose not more than five minutes; our conversation occurred after Dr. Mosser and he were through.

" *Q.* 36. Did you take the talking machine in your hand at that time or not?

" *A.* I did. I remember I caused the diaphragm to vibrate just as I do now, by placing my finger against it and pressing it in.

" *Q.* 37. What kind of a diaphragm was on the machine at that time — metal, or wood, or membrane, or what?"

Why did they ask him such a question as that, except for the purpose of leading him?

" *A.* A metal diaphragm.

" *Q.* 38. Did Mr. Drawbaugh say anything at that time about how the sound of the voice operated the machine? If so, what, so far as you remember?"

Now, there is a question which will draw out the whole thing.

" *A.* Yes, sir; I remember he said the voice produced pulsations."

Pulsations! That is not a description of the mode of operation. What kind of pulsations? That is not what they wanted of that witness. They have not brought a man like him merely to testify that this thing is operated by pulsations. A string telephone does that; they must get electricity into it.

"*Q.* 39. Did he, or did he not, make any reference to the use of a magnet in connection with the machine?
"*A.* Yes, sir; he spoke of applying both magnetism and electricity."

An electric speaking telegraph was one of the wonders of the world. It was then one of the unperformed miracles, the impossibilities of the world. Speech had been transmitted by speaking tubes, but to transmit speech by electricity was the wonder of the world when Bell accomplished it; yet when this professor of physics is asked how it operated he does not mention electricity! When a vigorous leading question is thrust at him all he says is, "he spoke of applying electricity." When; in the future? "Spoke of applying electricity"; this about a thing which, if it is what they allege, rested in nothing except electricity! Why, if the man had a string telephone, working by pulsations, and had a vague fancy that somehow or other — he had no notion how — electricity might be applied, he would naturally enough use such language. But to so speak of that which was nothing unless electric, — there is something wrong here.

"*Q.* 40. Are you able to say whether there was or was not, at that time, a small electro-magnet, with its poles in close proximity to the armature of the diaphragm?
"*A.* I am not able to say whether there was or whether there was not."

An electro-magnetic telephone is alleged; a professor of physics sees it; "really I cannot say whether there was a magnet on it or not."

His recollection became better in the course of the examination. Then we put the instrument into his hands and asked him: —

"*X Q.* 51. When you saw the instrument C at Mr. Drawbaugh's shop, was it in the same condition it is in now, and if not, what were the differences?
"*A.* As I remember it, it was in the same condition as now, but not so much soiled, and did not have the writing upon it, which I presume has been put upon it by the examiner."

On examining it carefully, his recollection is so good that he notices dirt and marks which were not there twelve years ago, he thinks, but with so sharp a memory his recollection is that it was the same then as now, — *and there is now neither electro-magnet nor permanent magnet.* Why, if this were one of the farming witnesses, I should say that the whole story was the mere wantonness of ignorance and romancing — or dishonesty. But in his case it becomes very fatal for the defence· Is it possible that that man, that professor of physics, should have gone there and that brief conversation taken place about such an instrument as this, if it was what they now allege, and nothing more be said? Is it possible that Drawbaugh would let him go away without saying anything more about it than that? That one man of this long list of witnesses was the only one who possessed the intelligence which would have enabled him to answer the questions and to give the information which your Honor wants. The most he does is to load the defence with another impossibility.

But that is not all. That man went there to his father-in-law's several times a year, for ten years after that, yet never had the curiosity to go over to Drawbaugh's shop to see that thing again. He was in the village again, but he thinks he was never in the shop. He never had the curiosity to go and see it. That is all the effect that it had on him. He says that afterwards, after the speaking telephone became known, he told some of his classes about it. He does not say what he told them about it.

> "*Q.* 46. When you first learned of the speaking telephone coming into public use in this country, can you state whether you, at that time, remembered and spoke of the fact of your having seen an electric or magnetic talking machine long prior?
>
> "*A.* Yes, sir; I referred to this instrument incidentally in class; and, if I mistake not, publicly at Gettysburg, at the Teachers' Convention, in connection with the instrument used to represent sound by flashes of reflected light."

They do not tell us just what he did say. What did he tell his class? What did he tell them this machine was? Did he tell them it was a talking machine? He did not know that. He had never tried it, and had never asked to try it. He only saw one end of the apparatus, and never saw it connected. If their statement of it is true, that C is a thing which was always ready to talk, all that you had to do was to attach the wires to it and it would talk right off;

and yet, did that professor of physics say to his class, "Gentlemen, I want to teach you to observe, as a student of physics should observe; whenever the first talking machine in the universe is shown to you, just ask the man if it works by pulsations; don't even notice whether it has a magnet, or rather conclude that it has not, and then lay it down and go away and don't you ever go near it again"?

That is the effect which such an instrument as Drawbaugh had — whatever it was and whenever it was, sworn to be in that condition at his shop, — had on a professor of physics; a man who was an old friend and to whom he had prophesied ten or a dozen years before, who went and spent his pleasure vacations in that neighborhood several times a year ever since, and yet he never went to see and never had handled that instrument. There was no machine that would talk there; he did not believe that there was.

It is a little curious that to Kiefer, to Wilson, to Weaver, the patent solicitor, Drawbaugh never mentioned his telephone. But he gets all these rustics to say he showed it to them. He didn't show it even to his partners; he didn't show it to his workmen in the shop; the professor of physics gets into his shop and he manages it so adroitly that that professor of physics gets out without any information about it, without the test which would prove that it was *not* a talking machine.

And yet he says this invention was disclosed to the public. Certainly that means that he was willing to disclose it. But in fact he never did. If I put a telephone in a box and talk to it, and your Honor listens at the hole in the wall at the other end, you get results, you get speech; you may know that I have got something that I can talk through. But that is no disclosure of the invention. That does not tell anybody how to do it. All that you could so learn, printed and published in a foreign country, would not spoil a patent here.

Such an exhibition does not amount to a disclosure of the invention. Now, no man ever knew what Drawbaugh's invention was. The whole thing, if he had some instruments at the date alleged, depends upon what the structure was and how it worked. There is not a man in existence who had so much as the glimmering of an idea of what their mode of operation was. Here is a professor of physics who sees it, but all that he learns about it is that it is operated by "pulsations"; and he does not know whether there is an electro-magnet connected with it; he does not even know whether there is electricity to it, until he is led up to an answer. Drawbaugh's own nephew says that he made those two instruments under his uncle's direction; and he thinks that he could, from memory, reproduce them. That, within the chain case decided by Judge Blatchford, is not a disclosure to the *public*. More than that, testimony of that sort is worthless. With the greatest desire to believe that nephew, one could not place any confidence in his statements. He is the only man in the world who pretends to have had the slightest knowledge of the structure of these instruments. I do not mean to say that some other man does not say, "I think when I saw this thing it had a magnet to it, and I think I saw some spools on it." But Drawbaugh is the only man that pretends to have a knowledge of the structure that will give the least light to any one.

I am not arguing what the truth is: I am trying to find out what the defendants' record teaches, what it amounts to, where it leaves us, what certainty it inspires.

There is another thing that I want to call attention to. I spoke of the magneto key, which consisted of a large horseshoe magnet placed on a frame and hung in trunnions, and with some spools, an electro-magnet, as near as I can make out placed in this position, at any rate placed on the front end of the permanent horseshoe magnet. Did the witness think he recognized that, by reason of the big magnets and the two spools attached? It is very much the same kind of thing as this big horseshoe magnet with the two spools in "C reproduced." I do not mean to say that they look exactly alike, but there is likeness enough between them for an ignorant countryman to be easily mistaken about them. We know that one of the more intelligent witnesses (Capt. Moore) mixed the talking machine up with the magneto machine. There is much in the evidence to suggest that a good deal of confusion existed with reference to those two machines. (See brief, p. 322.)

[*Adjourned to Sept.* 24, 1884, *at* 10.30 *A. M.*]

Mr. Storrow. Will your Honor please turn to defendants' Vol. I. p. 673. *Wilson N. Miller* was a witness, whose father at one time ran a grist mill at Eberly's Mills. He afterwards had the warehouse at one or two of the neighboring railroad stations, and carried on business that way. The son, Wilson N. Miller, the witness, was keeper of the warehouse at the station nearest Drawbaugh's shop, White Hill station, about a mile from there, and was for a long time the station agent. The defendants called him, under these circumstances, not asking him for any knowledge which he might have acquired, if he could have acquired any, about an alleged talking machine, while his father ran the grist mill in the village in 1872 and 1873, or 1873 and 1874, but asking him for knowledge which he acquired while he was station agent. He was station agent, or employed at the railroad station, from early in 1876 to April, 1878. He said that during that time he acquired some knowledge of a talking machine from Drawbaugh, in this way: Drawbaugh mentioned it, I think he says, once or twice, but he particularly showed it one day; took from his pocket, as he was at the station, an instrument, and, although the witness does not distinctly identify it in terms by examining the instruments on the stand and swearing to it by letter, yet he describes it so as to leave very little doubt that it is the large flat instrument **A**. His description is, "It was a small wooden box, with a tube to it to talk in; as near as I can tell, it was about five or six inches across, and an inch and a half thick." That is the only one which corresponds with that description. It has become interesting to know the date when he saw that. The witness himself does not have any definite recollection of the date. He was asked (page 674, Q. 29): "Referring to the time when Drawbaugh showed you the talking machine, do you recollect whether that was about the time when he first began to live at Mechanicsburg, or not?" Drawbaugh lived at Mechanicsburg from April 1, 1876, to April 1, 1877, and they asked him whether it was during that time. Miller said, "I don't remember."

"*Q*. 30. Referring to the time when you first talked about putting up the line from White Hill to Shiremanstown, do you remember whether that was about the time when he first began to live at Mechanicsburg, or not?

> "*A.* I don't remember; it was in the summer, but I can't remember what month."

He also testified that Drawbaugh suggested to him that his father should put up a line of wire between the two warehouses, a couple of miles apart, along the railroad, and perhaps borrow the use of the telegraph poles for that purpose; and he would furnish a telephone instrument. The witness told him that perhaps he would; but he did not really mean to, and nothing was ever done about it.

His first sight of any talking machine was the exhibition of this instrument to him, this instrument **A**. Now, when was that? The witness, with a very vague recollection, rather thinks that that was between the spring of 1876 and the spring of 1877; but his recollection is extremely vague. I have quoted one answer. There are some others to that effect. He said this on direct examination: —

> "*Q.* 28. Prior to his showing you the instrument at the railroad station, had you ever had any conversation with him about his talking machines?
>
> "*A.* Yes, sir; but I was so little interested that I don't know what it was any more. I might say, that my business there was about some money that he owed my father for coal; in the conversation, I found that he had no money, and I didn't ask him for it."

His first knowledge, then, was at the time when, as he says, he was there at Drawbaugh's shop dunning him for coal procured from the father of the witness, and which Drawbaugh owed him for. After that, the incident of showing him the instrument **A** took place. The witness had nothing but the barest recollection of the instrument. Subsequently, in our evidence in reply, we called that witness, and had him produce his father's books, which were kept in his own handwriting; and from them we proved that that first sale of coal to Drawbaugh was in December, 1876, and that it was only about a dollar; that, subsequently, there was another sale of a dollar or two, and then another sale; then two at the very end of 1877. The whole bill only amounted to about $6, and nothing paid until April, 1878. The first cash payment made was in April, 1878, and was a payment in full. It is perfectly plain, therefore, from the witness's own statement (now that we get the date to fix it by), from his own statement on direct examination, and from the sequence of facts, now that we have nailed those facts by the book, that his first knowledge, acquired when he went to dun for the coal, must have been at least as late as Christmas, or thereabouts, 1876, and apparently after the last coal was sold in December, 1877.

Now, when we find that at some time after that (because that was before this instrument was shown) Drawbaugh was carrying around to show to persons, apparently as the most suitable and best thing that he had, the instrument **A**, it gives us a very good insight as to the dates of those things which are alleged to have been better than **A**, and made afterwards. It gives us a very good insight as to the value of this way of fixing dates. The man says from mere memory, "I think it was about such a time"; but he also says the sequence to be that it was after he had dunned Drawbaugh for coal; and it so happens in this case that we are able to fix that date. After we had called him as a witness for that purpose, and proved that date by him, the defendants, apparently misconceiving or not understanding the purpose of the testimony, called him back again for them, and had him prove that Drawbaugh had paid him two bills — one already had been proved, April 4, 1878, and another of April 6, 1878. But it happened that the bill which we had reference to was a bill for coal sold on *credit;* Miller went to Drawbaugh's shop to dun him for it. The defendants proved that on the same day when the old bill was paid, or the day before, or the day after, he sold $12 worth of coal for cash, paid at the time and not charged. The defendants, according to their brief, seem to have put that in as though we were trying to accuse Drawbaugh of swearing to one sale when there were two made, or of swearing to two sales when there was but one. Your Honor sees the effect, the conclusive effect of those proofs.

Another witness (I cannot call him a witness in the ordinary sense, for he has not appeared on the stand, but he ought to be called one) was a man named *David Stevenson*, now a resident of Harrisburg, a machinist. It appeared in the evidence that he kept a machine shop and a machinists' supply shop, and that he worked for and with the Faucet Company, not as a mechanic in their shop, but as a maker of patterns, or in doing work for them in his own machine shop, in 1867 and 1868, and that he and Drawbaugh had many and intimate relations with each other ever since. He has done work for Drawbaugh, and Drawbaugh got up some pumps and a flue cleaner, etc., for him. They appear to have been partners, or jointly engaged in the manufacture of certain pumps and putting them out. He has been and still is a friend of Drawbaugh's, and at the end of this case he turns up as a man hunting witnesses for the defendants and in their employ. Now, here is a machinist, a machine-shop man, a keeper of a machinists' supply store, having intimate relations with Drawbaugh, having worked for him in his shop and doing work for him in his own, — doing work for each other, — *quasi* partners, jointly interested in making pumps according to some invention of Drawbaugh's (all this given in Drawbaugh's examination), and in the employ of the defendants at the close of his case. If there was a telephone there, he must have known everything about it, but they do not put him upon the witness stand. I do not need to argue the importance of that line of conduct. When you come to read the brief, you will find case after case with comments upon the conclusive effect, under such circumstances, of the failure to call a witness by the party upon whom the burden rests, and upon whom a very heavy burden rests. Brief, p. 269.

Another witness (defts, i, 498) is *William B. Stone;* fifty-four years old; a farmer by occupation, who says that he saw a talking machine at Drawbaugh's shop on the 15th of October, 1871.

" *Q.* 4. How do you fix the date?

" *A.* On that day I went over to George Free's, near White Hill station; I took over a couple of papers of chicken powder; then I went from Mr. Free's down to 'Squire John Drawbaugh's, a brother of Dan Drawbaugh, and from the 'Squire's down to Dan Drawbaugh's factory; he was in the factory.

" *Q.* 5. Did you make, at the time, any written memorandum or book entry of your visit to Mr. Free?

" *A.* Yes.

" *Q.* 6. Will you please produce the book and point out the entry to the examiner, in order that he may copy it on the record?

" *A.* Here it is.

"*The witness produces a book, and points out a memorandum which the examiner copies; as follows :*

"Sold Mr. George Free 2 packages of chicken powder, 25 cts. = 50. Oct. 15, 1871."

"*Q.* 7. Was this entry made in your own handwriting at the time?

"*A.* Yes, sir; in my handwriting."

"[*Objection to the use of the entry in the book unless the book itself is put in evidence. Witness states that there are a few pages containing private entries which he prefers not to exhibit, and by consent, those pages are cut out by the witness and retained by him. The book is then put in evidence by* **Mr. Hill**, *marked on the outside, and also on the page containing the memorandum above referred to, with the words 'Exhibit Stone.'*]"

Here is the book. It is one of Dr. Pierce's memorandum books. It was copyrighted in the year 1876, five years after this man made his entry in it "at the time." That fact, undoubtedly, was a surprise to defendants' counsel, and on the re-direct examination he asked Stone: —

"*Q.* 18. This memorandum book, which I had not examined until during your cross-examination, was not printed until as late as 1876 or 1877; explain how you could make a memorandum in a book in 1871, when the book was not printed for five or six years afterwards?

"*A.* I had an old book that I carried in my pocket for a long while; it had become almost worn out; it was nearly all destroyed and obliterated, that I hardly could read it; I took and copied this out of that book into this.

"*Q.* 19. What has become of that old book?

"*A.* It is all worn out; it may be lying round home somewhere, or leaves of it, but I don't know where it is; my attention was particularly called to this, because this chicken powder, that I sold to Mr. Free, was the first I ever sold; it is my own invention."

Then he says that he did not understand that it was an original entry which was required, but supposed that a copy would do. He came to testify, saw the defendants, and apparently told them that he could fix the date by an entry; they sent him home; he came back the next day, and this is what he produced — an entry, fortunately made in a copyrighted book. It is rather a curious book in some ways. This entry is made right in the middle of the book. Before this entry giving the date 1871, is an entry dated and stating some transactions in February, 1881. This man was examined in June, 1881. Then, after that, are some entries of transactions made in February, 1881. It is, of course, physically possible that he might have entered in the middle of that book, in 1876, something that he copied from an old book, and then in 1881 began again to make entries; but it is a very curious condition of things, and it is a very nice illustration of the value of that kind of witness, who swore as strongly as a man could, to an entry as being made in his own handwriting "*at that time*." I do not know what entries the witness took out of the book as being private memoranda, but here is one entry that he appeared to be willing to leave in, because he was permitted to take out everything that was private: —

> "Emma Stone told Butcher Myers's children that I stole money from her mother. Now I am going to prosecute that case to the bitter end. This was told Butcher Myers's children in the month of February, 1881. You will have to take the consequences for what Emma Stone said. She says her name is Emma Stone; but she is not legitimate, as got by her reputed father."

There is a little more of that sort of literature in there which he was willing to show. That appears to be what he wrote down as being what his neighbors thought of him.

Mr. HILL. He does not say that of himself, but of somebody else.

Mr. STORROW. Let me read some more, in order to be sure.

This is in William B. Stone's book and it is in the same handwriting as the entry which the defendants put in: —

> "Emma Stone has been at Butcher Myers's. You have been telling some one that I took your mother's money; and you also said that I was lying around loafing. You told this to Butcher Myers's children."

That looks as if it referred to the writer of the book.

Mr. HILL. That may be only some report of a conversation.

Mr. STORROW. *Peter C. Zimmerman* (brief, 307; app. 119, 500) says that he knew all about Drawbaugh's telephone from an early time, from 1867 or 1868. In 1871 he saw it. He was intimate with Drawbaugh from childhood; had known him for forty-five years; they were schoolmates together, and lived near each other, only a few miles apart; says he saw **F** and **B** in 1871; never talked through any instrument. It appeared that Drawbaugh and some of the defendants' counsel were at the village where this man lived to see some witnesses, and apparently they met this witness there at that time, during the preparation of the case. Here is a question put to him on direct examination (defts, i, 437):—

> "*Q.* 43. Have you had any talk with them about talking machines since that first visit?
>
> "*A.* I have spoken to Mr. Drawbaugh about it; yes, sir; several times, —talking about the machine and about the idea of vibration, and a certain remark he made to me in conversation; the remark was this, that he heard Mr. Samuel Hertzler's daughter play on the organ probably a quarter of a mile from his place of residence; while she was playing the organ, he took notice that there was a sound of a cut-off in that organ, just like a tap, tap, tap, a cut-off in that sound; being anxious to know what caused it, he went to Samuel Hertzler's, and found a break in the window glass; being loose, it would jar; from that he seen what the cause was of that there sound cutting off like; then he said that that showed him that he was right; that give him an idea that he was right in his study."

That gave him an idea that he was right. *Now, Mr. Hertzler never had an organ until the summer of* 1875.

Henry F. Drawbaugh (defts, i, 414; brief, 395; app. 112, 718) is the brother of Daniel. The story that he told in the summer of 1879, in the faucet interference case, when he was asked whether his brother was a boaster, and what machines he had made and completed, to his own knowledge, your Honor remembers (p. 128, *supra*); and it will take a good witness to do away with the effect of that statement. This same man appears to have been at his brother's shop pretty constantly from a very early period, although he lived some miles away. According to his story, told on the witness stand, his first knowledge of talking machines there was in July, 1872. I will read the question and the answer (defts, i, 415):—

> "*Q.* 10. Please look at the machines now shown you, marked **B** and **F** [tumbler and tin can, the first ones], and state whether you ever saw them before; and if so, when and where you first saw them.
>
> "*A.* I seen them at my brother's shop at the time we was making that cylinder and hoist rigging in 1872."

He had already produced his book and shown that they were making the hoist rigging for his distillery at his brother's shop in August or July, 1872; and he does not allude to nor suggest, directly or indirectly, any earlier knowledge. Now, there is the man's own brother, with no knowledge of this thing, according to his own story (I am not discussing whether it is true or not), until July, 1872. The defendants want your Honor to believe that the whole community had known of it for five years before.

His deposition is of the vaguest kind about every date except that; he don't know when he saw things; he saw them some time, and rather thinks it was about such and such a period, but cannot tell. This date however he is sure about. Apparently after a while it dawned upon the defendants that he made rather a bad story for them. If the Court was to believe this witness and take his testimony, and the picture that he gave them, five years of their story is knocked over. When he went there, the best thing was a tumbler and a tin can, whenever that was. It was the strongest date he fixed; it was the only one he pretended to fix. What do they do? Did they recall Henry Drawbaugh, this brother of the claimant, employed by the defendants in this case to hunt up testimony: did they recall him and ask him to eat his own words? Not quite that. They produced a witness, one McHenry, to say that in 1868 he heard a man by the name of Bricker say, that he had heard Henry Drawbaugh say, that he had seen a talking machine at his brother's shop and had talked through it. Henry Drawbaugh swears that the first of his knowledge was in 1872. They produce a man who says that he heard another man say four years before that he had heard Henry Drawbaugh say that he had talked through a talking machine at his brother's shop. They produced witness after witness, six or eight of them, to say what they heard Henry Drawbaugh tell them about this, six years, or five years, or four years before Henry Drawbaugh, the brother of the claimant, says he knew anything about it. That is rumor, it is only rumor, and it has only the value of gossip. But they expect this Court to believe it; and if this Court does not swallow that as reliable proof, it has got to find that the first five years of the defendants' story is untrue. But this is not all as to the value of that testimony.

Harry Drawbaugh was a man evidently of considerable means. At one time, in 1872 or 1873, he ran a distillery. In 1876–8, he ran a line of railroad cars from Cumberland County to New York, another to Philadelphia, and another to Baltimore. He owned the cars himself. About 1875, 1876 or 1877, his brother Daniel invented another improvement in molasses faucets, and Henry proposed to go into business with him to manufacture them; and he was in such convenient and comfortable circumstances that he proposed to buy a factory to make them in; and he bargained for one near his residence, and would have got it if the parties had not changed their minds and concluded to continue to use it for their own business. There was Daniel, with his brother alongside of him running at one time a distillery, at another time running cars to the three principal seaboard cities of this continent, and then proposing to buy a factory to make molasses faucets; and yet Daniel could not raise $50 or $75 with which to get a patent on his telephone. Well, of course, that had got to be explained away. So they had Henry testify that although he knew all about his brother's machine, and never went to his shop, from 1872 on, without seeing him at work on it, and he himself spent hour after hour assisting Daniel in experiments upon it, yet he really did not believe that there was any money in it; he would have loaned his brother money to support his family, but as for loaning him $50 or $75 for a talking machine, he didn't see any way of getting it back! That he *now* says was his opinion of the talking machine.

Well, it was hard enough to believe that; but the defendants (I don't know whether purposely or not) contradicted that. Brief, 83, 84. They got a man (Egolf), who was a partner of Henry Drawbaugh in the distillery, to testify that, in a conversation with Harry Drawbaugh, he had said that the telegraph was "nothing now no more," and that his brother had invented a talking machine by which persons in different places could talk personally with one another, and that Harry Drawbaugh expressed himself as thinking that this was more wonderful than the telegraph.

Another witness (Graham) says that in 1867 Harry said, "You will see. It will take the place of telegraphing in the next five years."

Another witness (Murphy) says that Harry Drawbaugh said that "It will take the place of telegraphing after a while." This was in 1867.

Bricker says Henry "went on to tell me that as soon as they could get it completed, they were going to use it in place of the telegraph."

North says that in 1869, Henry Drawbaugh said talking machines are "intended to take the place of the telegraph, and be cheaper." (These are in brief, bottom of pp. 83 and 84).

Now, Harry Drawbaugh says that he did not think it of any mortal use in the world, and that is the reason he did not put any money in it. Harry Drawbaugh says, to confirm his opinion that it was of no use, that he asked a telegraph operator if it would be of any use on a telegraph line, and that the operator said, "No; that everybody would overhear what was said, and that telegraphing was so private that it would not be fit to use." Then they got an operator to come and submit to have that question put to him, and he said he might have said something of that kind. Think of this man, with his brother alongside of him, a man of means, proposing to buy and set up a factory to make molasses faucets, who, for ten years, had known that this telephone was going to supersede the telegraph, to take its place, and yet not a cent to put in it!

John B. Drawbaugh (brief, 404; app. 189) was another brother, who lived in the village next to Daniel, and worked in the shop at times. He is a man of the vaguest memory, but, such as it is, he says that the first time his brother ever spoke to him about a talking machine, or showed him one, was about the first part of 1873; and they say that six years before that he had got a perfected machine. Are you going to believe that? He then says, that before that he had worked for the Faucet Company for a year or so, or a considerable time. He says that while working for the Faucet Company, he saw something or other which he understood was a talking machine, or intended for a talking machine, once or twice, lying on the bench; but his brother never spoke to him about it. Then they tried to turn the edge of that by having somebody swear that John disapproved of his brother's experimenting.

If John's story is true, we cannot wonder that he should discourage

Daniel, for even according to John it did not really talk; but John testified that he helped his brother experiment; and the knowledge he had of it, and of the attempts to hear through it, was acquired in that way, when he was assisting his brother to experiment with it. When they talked through the machine he thinks he heard some words, but not all; and thinks it was about 1873–4; and that it was after he began to work for Hauck & Co. in July, 1873; that he only heard "some words, but not all." At last, they closed his deposition by the question, "Your hearing is slightly defective, is it not?" He was testifying ten or a dozen years after the alleged event. Well, that is not quite all. The defendants gave one piece of testimony which is instructive as one of those little things which give an insight. It is the attempt to show that Daniel had a perfectly good talking machine, but that John thought it was not worth anything, even though it was a good machine. John's own testimony is that he never could get anything out of it, except on one occasion, when he got "some words, but not all." Did he think that a talking machine *that talked* was not worth anything? See what he said. Did he think that his brother, having a perfectly good talking machine, could not possibly raise the money to patent it, and that that was the reason that it was not patented? See what he says. He says that in 1873, when Daniel first showed it to him, he said to him (defts, i, 614, cross-answer 102), "Dan, if this is as good and profitable a machine as you represent it to be, *why don't you get it patented?*"

That is the question which your Honor will ask; you have got to answer it for yourself. The brother did not know any reason, if it was as good and profitable a machine as he said it was, why he should not get it patented. What is the use, after that, of saying that everybody knew that it was a good machine? The evidence is — the defendants' record is plenary — that the neighbors said that a talking machine that *would talk* was a profitable machine, and that he said so also. They attempt to make us believe that the reason why he did not get it patented was because he was too poor, that everybody knew that he was too poor; but his brother said, "Why don't you?" His brother knew whether he was too poor or not.

Deafness does not seem to have made any trouble in hearing persons talk through the machine. I have said something about the character of these witnesses; that they were mostly country farmers; but occasionally there is one of apparently higher grade. Such a one was *W. N. Kline* (defts, i, 656). He was forty-four years of age, and an insurance agent; for aught I know he was a life-insurance agent; and he must be a skilful man who can talk a delusion into a life-insurance agent. He has known Drawbaugh since July 12, 1867; and his particular knowledge of talking machines is that, in the spring of 1879, Drawbaugh showed him this machine **P**.

Now we have a man of a better grade than most of the others, a sharp and shrewd insurance agent, testifying, in the spring of 1881, to an incident which took place only two years before. This is the instrument. [*Exhibiting instrument to the Court.*] It is a kind of double-barrelled instrument. *This* part, connected with the short mouthpiece, is a carbon microphone, which will serve as a transmitter. *This*, with the long rubber tube mouthpiece, is a magneto contrivance, which will serve as a receiver to such a transmitter; it has a diaphragm and a magnet, a permanent magnet, at the back of it.

The magneto part is intended as a receiver, and the carbon microphone part as a transmitter. Now, when you place two of those at different stations, and connect the transmitter of this one, in my left hand, the part with the short mouthpiece, with the receiving part of the one at a distant station, you can talk into the transmitting part at one station, and the person at the distant station listens at the receiver of his set. The convenience of this particular arrangement, having the transmitter and receiver mounted on one board, with a long tube to the receiver is, that the operator using it may place the tube at his ear, and his mouth at the transmitter, and thus, without moving his hand or turning his head, he may listen and speak at the same time. This, which Mr. Ott now hands me, is a reproduction of the instrument made recently for the purposes of this case. Drawbaugh never made but one; and in using that one, in experimenting with it, instead of connecting this transmitter with a receiver at the distant station, a corresponding instrument, he ran his wires around the back of the board so as to connect the transmitting part directly with the receiving part only three inches distant; and thus you had a transmitter and receiver on one board three inches apart. You could thus talk into one, and listen at the other, although the line was only three inches long instead of a mile. There is one obvious inconvenience. This tube, and through which you listen at the receiver, is said to have been at one time six or eight feet long; but, of course, even at that distance, the person listening would hear through the air and not through the machine the voice of the person speaking less than six feet off. Moreover, your Honor knows how feeble the best telephones are. You lose from ninety to ninety-five per cent of the sound, even with good telephones. A telephone that will lose only ninety per cent of the sound is very good; one that will lose only ninety-five per cent is called good. A person listening in this way [*illustrating*], even if this tube were six feet long, would of course hear through the open air what was said by a speaker within three or four feet of him, and would fail to hear the much fainter sound which came through the instrument and the tube. They produce one witness, the insurance agent, Kline, and he is the only one, I think, who pretends ever to have heard through that instrument; and this is his testimony. He is speaking of something which occurred in 1879, two years before he testified (defts, i, 656): —

"*Q.* 18. Show us how you used the machine in listening.
"*A.* I took this here [*witness takes up the mouthpiece attached to the free end of the flexible tube*] and put it right to my ear, and he talked into the short tube on the other side of the machine; that is the way I think he did."

So they were separated at most by the length of the tube when it was distended.

"*Q.* Was the flexible tube of the same length as now or not?
"*A.* That I could not say. There was a short one, that he had in the first place; this was first; then I put this to my left ear, and then I could not tell any more what he said; I mean I don't remember the words that he spoke through it; then he put it to my right ear, which is my deaf ear; afterwards he wanted to show it more distinctly, and he took this tube off, and he put a longer one on, — perhaps six or eight feet long, — and I put that to the ear in which I am hard of hearing,"

[which left open his well ear, the one nearest to the speaker as this instrument is arranged], "and he spoke into the other side of the instrument, and said that Harrisburg was situated on the banks of the Susquehanna River; this was on the deaf ear: it was as distinct as could be; that is what makes me remember it, because I had not heard anything in that ear since I was a young man."

That is a sample of the better class of witnesses; but he reeled that off, and did not seem to see in what a position he was putting himself.

I wish to turn back to one thing in Henry Drawbaugh's deposition (defts, i, 419). There has been a great deal of talk in this case by the defendants' witnesses of what they heard Mrs. Drawbaugh say — that Mrs. Drawbaugh said that she wished Dan would stop his experimenting. There has been a great deal of talk of the opposition of his wife to experimenting. It was hearsay talk, all of it, — mere second-hand gossip. *They have not dared to produce her and put her on the stand as a witness;* for she is a perfectly competent witness. Her husband is not even technically a party to the record. They have called witness after witness to say what Mrs. Daniel Drawbaugh said. They called two servant girls out of her household to tell, from a fourteen or seventeen year old memory, what they say they had heard her say; but they have not dared to put her on the stand, although they called three hundred and sixty-six witnesses. They call two servant women, his nephew's wife, and lots of other women, but have not dared to call her. There must have been some reason for not calling her. I think we begin to see from Henry Drawbaugh's deposition what that reason was. He was asked this question (defts, i, 419): —

"*Q.* 46. Did you ever hear your brother Daniel's wife talk about his spending his time experimenting; if so, how often and during what years?"

It was the defendants who put that question. He answered: —

"*A.* I have heard her make mention of it very often *during the year of* 1876 *and from that up, not from that back;* she said she wanted him to stop his fooling and go off; he had good offers to superintend for other firms; and then they would try and live better; they had been living so poor for many years on account of his experimenting.

"*Q.* 47. Did she talk pretty strongly on that subject or not?

"*A.* She did, very."

Was there anything that happened in the world in 1876, which should set experimenting on telephones, a man who took an interest in whatever interested the scientific world? Why, if the defendants' story be true, all those instruments, with two or three trifling exceptions, were finished by midsummer of 1876, or early in the fall. No room for work and experiment on telephones after that high-water mark was reached.

I spoke to your Honor yesterday of the magneto key. Here is a common call key, such as are in commercial use on telephene lines.

It is not his key, but in the essential features of its construction it is not unlike his, and works on the same principle, so that your Honor can understand how his worked. [*Exhibits instrument to the Court.*] There is a large permanent horseshoe magnet. Here, opposite to the end of it, are two coils. These coils are mounted on the end of the magnet. The lower leaf of the magnet is prolonged, and they are mounted on that, and so they become magnetic — deriving their magnetism from that powerful magnet. We have there, in that condition, a powerful magnet, or rather, I should say, an electro-magnet, with two cores, surrounded by coils of fine wire in the usual way, which cores are powerfully magnetized by a heavy permanent magnet. The more heavily magnetized they are the better. We have here an iron armature: the armature rests on top of the cores, and pressing this push-button pulls it away. The movement of that armature will generate a current. This push-button pushes on a lever which carries the armature. It is a familiar contrivance, and has been in use for years. It is not a new idea, but an old one. It is not a very good contrivance; I mean not practically desirable, because it generates one current only, and as it rings by striking a bell, and there is only one stroke, it is rather hard to wake a man up with it. At the present time, they prefer to put a magneto machine on, and turn a crank because it rings the bell more noisily. Instruments of this class have been known for a great many years. The contrivance that Drawbaugh had was not unlike that. It consisted, as I have explained to your Honor, of a heavy horseshoe magnet with an electro-magnet placed in front of it, and that horseshoe magnet was to be rocked. It was a bad contrivance, because the operator had to rock a heavy magnet instead of a light armature as here. Afterwards he modified it so as to keep the heavy magnet steady and rock a smaller one. He had one of that kind, which was to be used for the purpose of fire alarms, and was so advertised. He carried the instrument to Mr. Kiefer, who built the Harrisburg fire alarm, and wanted him to try it. The fire-alarm boxes in the street are not designed to ring a church bell, but simply to signal a man who is supposed to never sleep, in the central office. An instrument of that kind would, he thought, signal a watcher perfectly well, and it would save the expense of furnishing batteries to supply currents to run lines all over the city.

Although it is not a very good contrivance, yet a person who might wish to save the expense of a battery might think it was a very good affair, when used for that purpose. Another of the purposes for which Drawbaugh intended it was that it should ring bells. He describes, in his cross-examination, that he arranged different bells, connected with different magnets, which he proposed to ring by themselves. He was endeavoring, though he never succeeded, and apparently does not know how he ought to have proceeded to do it, so that he could ring one bell or another at his pleasure. He did have one arrangement by which, by changing certain circuit switches, he could ring one bell here or another there. He had this arrangement put up in his workshop, where he was making the experiment. One purpose was to call rooms at a hotel, and to call each room at pleasure.

He had one witness on the stand by the name of Jacob Shettel. Shettel was a nephew of his by marriage. He became one of his partners in the clock company, which started in the spring of 1878. Mr. Shettel was the most active man in starting that company. He had been a farmer, but for many years had owned and operated a thrashing machine, which in that country they take about from farm to farm at the proper season. He was called, among other things, to testify to the machine **H**. He was asked when he saw it (defts, i, 217): —

> "*Q.* 18. Please look at the instrument now shown you, marked ' ,' and state whether you ever saw it before; and if so, when you first saw it, to the best of your recollection.
>
> "*A.* I saw it early in the spring of 1877.
>
> "*Q.* 19. Was it, or was it not there, at Mr. Drawbaugh's shop,

at or prior to the time when you first began to investigate the electric-clock business, with a view to going into it?

"*A.* Yes, sir; it was there in the spring of 1877, the year before we went into the clock business, I saw it.

"*Q.* 20. Did you hear any conversation through it, at that time?

"*A.* Not any conversation; he rang the bell attached to it; that was all that he did to it.

"*Q.* 21. Did he tell you what it was for?

"*A.* Yes, sir; he told me what it could be used for, *for giving alarms and calling at rooms of hotels.*

"*Q.* 22. Did he tell you what the machine **H** was; what name did he give it?

"*A.* I don't remember that he gave it any name.

"*Q.* 23. Did he speak of its being a talking machine or not?

"[*Objected to.*]

"*A.* I don't remember that he said anything about its being a talking machine.

"*Q.* 24. Did you understand at the time whether it was a talking machine or not?

"*A.* *I don't know as I did;* there was very little explanation of that instrument that he gave to me at that time."

Now, is it not plain beyond question that, while offered as swearing to a talking machine, this man's memory is that Drawbaugh showed him something which looked like **H**, which rang a bell, and which Drawbaugh said was to be used for calling rooms at a hotel; but that he did not try to talk through it, and did not say that it was a talking machine. It is as plain as can be that he mixed up the alarm bell which he did see, with that instrument which he did not see, because as we believe it did not exist at that time. We believe it was made two or three years afterwards. That witness is one of their more intelligent men. He is familiar with machinery, and making his living by owning and running a thrashing machine. He was enterprising enough to go into the manufacture of electric clocks. And yet that is the best testimony that that witness can give. Other witnesses were not mechanics, but mere laborers. They have not the intelligence to give the description which destroyed him; how much can you trust them?

But there is a little more about this man that I wish to state. He was, as I said, in these relations with Drawbaugh. In the spring of 1877, they began negotiations about going into the clock business, and Mr. Shettel got his two brothers-in-law — the Grissingers — to join him and become partners in the clock. Now Shettel's testimony is that Drawbaugh never said a word to him or made any application to him to put money into the telephone; nor did he ever hear Drawbaugh say anything about trying to patent it. I will read from his testimony (defts, i, 216) : —

> " *Q*. 35. State whether or not you saw other talking machines there along during that time from 1872 to 1878, besides these instruments **A**, **B**, **C**, **D**, **E**, **F**, **G**, and **H**.
>
> " *A*. Nothing else; that is all I saw.
>
> " *Q*. 36. State whether at any time during that period [1872 *to the spring of* 1878; *our patent was in the spring of* 1876] there was any conversation between you and Mr. Drawbaugh about patenting the talking machine, or as to why he did not patent it at the time.
>
> " *A*. I don't remember of any conversation between us as regards patenting.
>
> " *Q*. 71. Did you ever talk to him, prior to the establishment of the Clock Company, about going in with him on any other invention than the clock?
>
> " *A*. No, sir; not to my recollection."

Shettel was called, also, for another purpose, — to prove Drawbaugh's poverty; and he proved it in the most heart-rending language. He said that Drawbaugh told him at times that he was very poor; told him he did not have any money to get what he really ought to have for his family (defts, i, 221) : —

> " *Q*. 49. When did he tell you that?
>
> " *A*. Along during the year 1878."
>
> " *Q*. 50. State any other facts that you remember, bearing on the subject of his poverty during that year.
>
> " *A*. We came to Harrisburg at various times during that summer, and he didn't have the money to pay his toll, five cents, across the bridge, and I paid it for him different times; and also he didn't have money to buy tobacco for himself, and I bought that for him several times; and I several times gave him a dollar when we were over here to buy groceries for his family."

Drawbaugh was a partner in this Clock Company at that time. He had just received $500, a part of which he used to pay off a mortgage on his house; he had by that time bought another house on which he had a mortgage, and was paying that off; the other part of the $500 he says he had used in paying bills for the support of his family. His bargain with the Clock Company was that he should go in wit them, and work for the Clock Company, but get no pay for his labor unless profits came at the end. He was plainly in that condition of credit and resources where he would not be obliged to have daily pay to live on, or he could not have gone into a contract of that kind. On cross-examination we asked Shettel something about that. We asked him if he had not overstated his poverty. Not at all. He was as poor at all times as then. Finally we asked him (defts, i, 233): —

> "*X Q.* 156. If he was as poor as you say, how did you suppose he was going to live at all and support his family under such a contract?
>
> "*A.* Just as he did before he made that contract, by working many days for nothing, and depending upon his creditors to give him as they had been giving him before; but if he had asked of me for the loan of $25 or $50, I should have done it, but he never asked me for the loan of any money, with the exception of several dollars that I gave him at times here in Harrisburg, when we were over."

Now we begin to get a little insight into the credit of that man. He had resources and credit. Here was a man who would have loaned him $25 or $50 any time if he had been asked for it. Here was a man who went into the Clock Company with him, who was intimate with him, frequently in his shop, and he never asked him for $25 or $50, and never spoke about patenting a talking machine.

They put in a lot of judgments which had been obtained against him at different times. He appears to have been a man very slow to pay his debts. They put in judgment records; but it appears there never was an instance where the sheriff seized his goods and sold them. They would get judgment liens on his property. If there was a judgment, as of a justice, which only reached personal property, which could only be satisfied out of personal property, he, as was the case several times, got the attachment extended and the execution postponed for six months or a year, as under the Pennsylvania statutes he could do, by swearing that he had unincumbered real estate sufficient to meet it. There are certainly two cases on the record, where he got the execution extended six months or a year in that way (brief, p. 346). But when the sheriff came to him and said, "Now I have got to have that money," he always paid. Never were his goods seized in all those years.

I want now to turn to the deposition of *Cyrus Orris* (defts, i, 178). Your Honor will find throughout this record two things: one is, that evidence which appears to be of any importance is to be found in the question, rather than in the answer. The use of leading questions was the method almost invariably adopted by the defendants in extracting from their witnesses whatever they did extract. Right through from beginning to end, they would ask a man, "Were you there at such a time, and did you see a talking machine at such a time?" They would thrust under his nose an exhibit, and ask, "Did you see that at the time?" The Court knows that practised counsel do not do that habitually, unless they know it is necessary. A man may occasionally lapse into that method, but counsel of skill and long practice do not do that all through a case, unless they know it is necessary. It is not now a question of excluding such evidence. I am commenting on its value.

Mr. EDMUNDS. Some of your evidence, I think, is of that kind.

Mr. STORROW. I will tell the Court how they got their testimony. One man is asked for a simple fact, or a date, and the fact or the date is put in his mouth. I think I know the case that Mr. Edmunds refers to, and it is very proper to refer to it. In the case of Mr. Rupp (whose testimony I referred to yesterday), at the close of his testimony, we put to him, as we did to many witnesses, a question of this kind: "If Drawbaugh had had a practical speaking telephone all those years, and had shown it to his neighbors, and made it known that speech could practically be transmitted through it, do you think he would have had any difficulty in getting money?" That kind of question was put. I do not think those questions were necessary, because the Court would infer as much; but I think they were proper questions, and were properly put in that form. Such questions cannot very well be put except in that form. *They bring before the Court very pointedly the fact that the prominent men of that community do not believe the story.*

There is one other thing to be observed generally, with regard to the questions put throughout the defendants' case. They would put a question to the witness, "Will you state *to the best of your knowledge, recollection or belief?*"

Now, when you [illegible] getting a dull witness, a countryman, to testify to things four or five or ten years old, and you don't dare to put a question to him except in that qualified way, by salving over his conscience and permitting him to say, if he hears any question about it afterwards, "Well, I didn't know; I only answered to the best I knew," — there is nothing positive about it. The whole of their testimony is, by that fact, degraded below the level of evidence. The testimony of Cyrus Orris is of that character. This witness is a very good example, also, of the worthless testimony of the man who thinks he once saw something there, without anything to fix the date, and who lived alongside the shop ten or fifteen years. He is asked whether he made one of these affidavits about what he was to testify to (defts, i, 183): —

"*X. Q.* 56. Did you make an affidavit about them?
"*A.* I told them to the best of my knowledge; I couldn't just think of it at that time.
"*X. Q.* 57. Did you sign and swear or affirm to a statement at that time?
"*A.* Yes; to the best that I knowed."

He says he "couldn't just think of it." Your Honor will find that form of answer running all through their evidence, — "To the best of my knowledge"; "As near as I can tell"; "The best that I can remember."

John C. Smith (brief, 394; app. 91) was the witness I spoke of (p. 142, *supra*) who worked three years for the Faucet Company, and lived in the village, yet does not profess to have known anything about this until 1872. He began by testifying that he was at the shop considerably on Sundays. Then they asked him this question (defts, i, 351): —

"*Q.* 20. Did you hear any talking carried on through those instruments during that year?
"*A.* To the best of my knowledge, I did."

Well, in one sense, a man can only answer to the best of his knowledge, but when you find that kind of testimony on the vital points of the case, running through deposition after deposition, it makes the testimony very doubtful; it brings it below the level of evidence. This man, Smith, worked at that shop during a good part of 1877, the year after Mr. Bell's patent.

David H. Good, the storekeeper of the village, is another witness to whom I will refer. He is asked this question (defts, i, 527; brief, 378): —

"*Q.* 4. While you resided there [*which was from the spring of* 1867 *to the fall of* 1870] did you, at any time, have any conversation with Drawbaugh with reference to his talking machine; if so, what was the conversation, and when was it?

"*A.* No, not individually, but heard some; in the fall of 1868 I heard him tell two men in my presence that he had a machine that he could convey sound, or talk as plain as he was talking now" [*the Court knows that that was not true*]; "then he went on, of course, with a great rigamarole, that he had experimented; he did not say just what distance, but that he could talk at a distance, or hear."

We called one of those men (Hart), who said that nothing of the sort took place. The other one never was called by either party that I know of; they say his name was Ditlow; but as the other side have called three or four Ditlows, I don't know whether this man was one of them or not. Good was cross-examined about it.

"*X Q.* 15. When you heard him say that he had got a machine that would do what you have stated he said it would do, I suppose you believed, right off, that he had got such a machine, and that it would do it, did not you?

"*A.* I had every reason to believe it.

"*X Q.* 16. What do you mean by 'every reason?'

"*A.* I never knowed him to say anything of the kind but what he brought to perfection, in the way of machinery and invention.

"*X Q.* 17. Did it not strike you as rather a startling kind of machine, if it could do what you said it could do?

"*A.* Yes, sir.

"*X Q.* 18. And, notwithstanding that, you were ready to believe right off, that he had invented and made such a machine, just because you heard him say so to two men in your store; is that so?

"*A.* Yes, sir.

"*X Q.* 19. Do you think that the most of people who knew him in that community were disposed to accept his remarks about his own inventions with the same confidence?

"*A.* To a great extent."

That is the community, and those are the kind of people upon whose testimony your Honor is asked to rely. They testify to the best of their recollection, so far as they know.

Turn to the brief, page 283. It seems very startling that, in a dozen years of work on a telephone, by a man who was a good draughtsman, he should never have left a single piece of paper, or a single sketch, or any writing, or anything of the kind. It does not seem possible that a man could work out such an invention without a single sketch, or an indication of some kind of what he was doing; and apparently it so seemed to the defendants, for they had Drawbaugh testify (defts, ii, 782): —

> "*Q.* 26. Have you been in the habit of making and preserving any written memoranda or records to show the dates of your various inventions and improvements in telephones?
>
> "*A.* No, sir; not further than that I used to make plans on drafting boards for working by.
>
> "*Q.* 27. Were they preserved?
>
> "*A.* No, sir."

Well, a drafting board is a curious kind of contrivance for the drawing of a little instrument like a telephone. The back of a letter or a piece of paper is sufficient for that. But was that his habit? They put in the testimony of Mr. Lory, and he said that he recollected seeing a sketch by Drawbaugh in 1864, and they asked Drawbaugh about that, and he said, in reference to that alleged sketch of a telephone (defts, ii, 785; ans. 39): —

> "I was in the habit of making sketches or drawings at the time when I would be working on any inventions; not only this particular one, but all inventions."

That is not all. In the summer of 1879, testifying about molasses faucets (alleged to have been invented along about the same period as the telephone) in the faucet interference case, he produced sketch after sketch of this faucet. On cross-examination he said he had a box in his shop with perhaps five hundred letters and papers in it; and that he was in the habit of making sketches on the backs of letters and on pieces of paper, and he produced sketch after sketch. He did a little more. His evidence about it is in complts, iv, 100, quoted in brief, 284. Let me read exactly what he says. He produced a sketch of a faucet and said: —

> "*A.* 68. It was made about 1871 or 1872; I can't get within a year, perhaps; there are a number of other sketches in the same

book of other machinery made about the same time; they are all old sketches.

"*Q*. 69. Will you produce any other sketches?

"*A*. Here is a sketch that I made about the time that I was experimenting on telephones or phonographs, about 1874 to 1876.

"*Q*. 70. To the best of your knowledge, when was that sketch made?

"*A*. About 1876; it might have been made before.

"*Q*. 71. Was it made later than 1876?

"*A*. To the best of my knowledge I don't think it was.

"[*Book marked* 'G,' *produced.*]"

He said that he then (1879) had a box with about five hundred papers in his shop. Then another sketch is produced, and he was asked: —

"*X Q*. 151. [*Sketch and book* G *handed witness.*] Give us, if you can, the exact date, or an approximation of it, when that sketch was made.

"*A*. That might have been made three, four or five years ago. I go by the nature of the drawings; I mean the telephone drawing and the old plan of faucet. I was working on the telephone about that time."

Now, that is curious again. He fixes the time when he was "working on the telephone" as an epoch to date other things from; and the year of the epoch was 1876, perhaps sooner (three years before 1879, when he testified), but he thinks about 1876. That, an epoch of *work?* According to his present story, it was really the end of a dozen years of experiment, and he has never made any progress since. But apart from that, what does he mean by saying that he had no telephone sketches except such as had been made on a drafting board, and which had been planed off, when two years before he testified (in 1879), he *produced a book with telephone sketches in it*. Certainly the man's memory is not very good about it. That telephone sketch we have not got; it is not in the case; it is not on file in the Patent Office. It has been taken away; I do not say improperly, but as exhibits are usually used at the Patent Office; they are produced and shown, not filed, and then after the hearing, are taken away. He certainly did have sketches of the telephone, during all these years, yet they do not produce a paper showing anything about telephones. (See brief, pp. 283–285.)

Now, I think I have said enough, without going through any more witnesses, for your Honor to feel, more than ever before, the importance of the rule which the Court has laid down, that in cases of this sort, an important patent, on so stale a claim as they have presented, cannot be overthrown on memories nor on anything less than proof from conduct or unmistakable paper.

There are, however, one or two more witnesses whose testimony I want to speak of in this same connection. And first I will ask your Honor to look at defendants' surrebuttal, page 254; the witness is *Augustus Kahney* (app. 613). The particular and important thing in his testimony, and the only thing which has any direct bearing on this case, is his statement that he worked about ten days for the Axle Company at Drawbaugh's shop, helping them to put up their machinery, in the spring of 1875, about February or March; and that while there, at that time, he saw two instruments. He describes them at the bottom of page 258:—

> "One was about two inches through, and, as near as I can tell, from an inch to two inches high, with a mouthpiece on top of it. The other one was about six inches through, as near as I can tell, and an inch, or a little over an inch, through, that is, high, and had a mouthpiece on the side, or top, towards the edge of it."

Then he was asked, with a dramatic touch, to accompany Mr. Ott, the examiner, to Mr. Ott's office across the street, to go over and pick one out; and he goes over, without counsel, and picks out an instrument and brings it in. Well, that was not much of a feat.

He was a pretty important witness — *in one respect.* Your Honor will see presently how lame was the case which needed to be supported by such testimony. His testimony was that the instrument he saw at that time was one of those magneto instruments **D** and **E**, and flat instrument **A**. Now this was important evidence, for **D** and **E**, your Honor will find, are the instruments upon which this case must turn, as matter of law. They were terribly lame on witnesses to those instruments; he was a very important witness. Why didn't they have him before? He was called in the fourth year of the case, last winter, in surrebuttal. He lived right alongside of Drawbaugh all these years. Why did they not call him before? We found out, on cross-examination, that when they were taking their first testimony, three years ago, they visited him twice; that Mr. Drawbaugh, the counsel, and a justice of the peace, twice saw him, twice talked with him, and yet they didn't call him as a witness until after the lapse of three years. What does that mean? That is not all. About six months before he was called, he met one of the complainants' representatives in Harrisburg, and told him about the talking machine. He said that he worked at that shop, putting in machinery for the Axle Company, for a week or ten days, in the spring of 1875, and that he didn't see any talking machines then and was sure there were none, and that he remembered when he did first see a talking machine; that the first talking machines he saw were two machines like those very two, **A** and **D**; that he first saw them when he was living on a certain farm, and that he moved to that farm in the beginning of 1879. That he did then move to that farm is proved, because it was sworn to when he was on the stand for the defendants. He not only told all that to one of the complainants' representatives, but it was written out, and he signed it; and now, when he goes on the witness stand, that is put in his hand and he admits it, and he says, "Yes, I did write that; that was my recollections at the time"; but his recollections changed afterwards. So that when they were preparing their testimony in chief, they twice visited him, but did not call him. Six months before he testified, his recollection was that at the time the Axle Company was doing business, there was nothing of the sort there, and that he first saw it four years afterwards, in 1879; and he then says that after that it came to his mind; and now he comes and testifies as one of their prime witnesses, — if you can believe a word of his testimony.

There are some other witnesses to whose testimony I must call your Honor's attention (which appears in the same volume, page 224). They are his brother, *Orlando Kahney*, and two men by the name of *Joseph* and *Abraham Ditlow*, brothers, who were brought by us from the West to testify. The two Ditlows lived in Indiana and Kahney in Illinois, west of Chicago. They testified that, being at Drawbaugh's shop a good deal, frequenters of that shop more or less, under such circumstances that they would have known about a talking machine, if there were any there, they did not know of any, and did not hear of any until after the fall of 1876. They came on from the West together, and testified about the 1st of January,

1882. Those are witnesses whose subsequent conduct was such that I should not feel obliged to speak of them, or of their value in the case, were it not for the fact that I find in the brief of defendants an attack made upon me, about them; and I propose, therefore, to have your Honor read the testimony about them. I know perfectly well that when my brother Dickerson gets up to reply to what may be said about it, your Honor will come to a right conclusion, but I do not propose to have your Honor go for one moment with any doubt upon your mind, or to have one moment intervene between the time when your Honor's eye strikes such a thing in their brief, and the time when your eye shall see the refutation which the testimony affords. I do not propose to have any question about such a matter as that.

These men came from the West to testify for us, as I have stated. They were cross-examined. It would have been a very good thing for the defendants to have proved by a witness whom we called, that one of those men knew that there was a talking machine there. They were all old friends — warm personal friends — of Drawbaugh's. We had to go into that community for them as we did for everybody else, — among his friends and intimates, in his neighborhood, among those interested in him, — I mean in a friendly sense.

These persons were cross-examined; and if Drawbaugh had had the slightest recollection that upon any occasion he had ever shown to one of them a talking machine, he and his counsel would have put the question to them on the stand, "Don't you remember at such a time and place he showed them to you?" Nothing of the kind was done. Well, the defendants brought them back here. After they testified for us, they went up to Eberly's Mills, to the neighborhood where they or their families used to live, and one of them stayed there for two or three weeks, and the other six or eight weeks, and they visited Drawbaugh. They went to his house. One of them stayed all night with him; the other stayed in the next house, with Drawbaugh's nephew, George Drawbaugh, all night. They spent a long Sunday, two of them did, and I think another was there many times at his shop a week after; and they talked about the case with the whole Drawbaugh family. Then one of them comes back and says, "Why, I now remember that I spent a whole winter experimenting with Daniel Drawbaugh on his talking machine. I can't remember what it was, but I remember that I spent a whole winter experimenting on it."

That is one of the Ditlows. But he is not the witness I mean to speak of particularly.

Another one of them comes back — Orlando Kahney — and says, "Yes; I am all wrong. I had forgotten I was there. I was there in the summer of 1875. I went there with a fellow hireling, Basehore; he and I went there together to grind scythes, and we talked through the machine, — at least I did." And they produced Basehore to support him. And such a support! Kahney swore, even then, that that was the first that he knew of it; but Basehore swore that it was an old thing to Kahney. Basehore's story is that they went there and talked (he did not, but he saw Kahney do it) over a line which ran from Drawbaugh's shop to his house, in the summer of 1875. Now, we know from Mr. Drawbaugh's own testimony that no such line existed in that year. We know from the testimony of others that about 1878 a line running all the way, or part of the way, in that direction, did exist. That is enough to take care of those witnesses.

But that is not all. The defendants introduced this witness, Orlando Kahney, with a good deal of flourish of trumpets, because he had testified for us; and because, after going back to the West, he wrote the letter which is at the bottom of p. 225, dated Jan. 1, 1883 (it should be Feb. 1; it is so understood). He had spent a day with Drawbaugh; had seen him again and again; had been at his house. He goes West and then writes this letter (defts, iii, surbtl, 225): —

"TRIUMPH, Jan. the 1, 1883.

"*Friend Daniel,* — I thought I would write you A few lines to let you know that I got back all right again and to let you know that last night there was some things came to my mind the first that I ever heard of a talking Meshien it was in seventy-five and know exactly when it was or can find out with very little troubel and thare was A man told me in Mendota to-day [*Mendota was where he lived*] and he said that he knew of you talking of having being working at the talking maschien in the year of seventy and let me know whether I shall see Smith or not right soon for I may leave here soon with this I close my respects to all, address Mendota, Lasalle County, Ill."

Smith, it appeared, was a man in Illinois, in Chicago, with whom this person had been a fellow workman. Before he went West, and before he wrote this letter, which professed to be the first announcement of a change of views, he had told Drawbaugh that Smith would probably be able to support him in proving that he had known of the thing at a date earlier than he had testified for us.

Mr. Hill. That is your inference. You do not state that as a fact?

Mr. Storrow. State what?

Mr. Hill. That he had told Drawbaugh.

Mr. Storrow. Your Honor will read it; but my recollection is that he had talked to Drawbaugh about going to see this Smith. The letter shows that. "Shall I go to see Smith or not?" What he expected to get from Smith was to get Smith to swear that he (Kahney) had made to Smith statements inconsistent with what he had sworn to when he testified for us.* Kahney went to see Smith, and thereupon Smith was not called. Then they asked Kahney (p. 230): —

---

* Kahney testified (defts, iii, surbtl, 231): —

"*X Q*. 61. Who was the person referred to as Smith in the letter?

"*A*. David Smith.

"*X Q*. 62. Where does Mr. David Smith live?

"*A*. He lives in Chicago.

"*X Q*. 63. What is his business?

"*A*. He is a dentist.

"*X Q*. 64. Had Mr. Drawbaugh asked you to see Smith?

"*A*. No, sir; I told Mr. Drawbaugh I would go and see Smith.

"*X Q*. 65. What were you to see Smith about?

"*A*. To see if he remembered of the time that I spoke to him about the telephone.

"*X Q*. 66. How came you to offer to go to see Smith about the telephone?

"*A*. To see if he remembered if I had made any dates on the day that we spoke of it.

"*X Q*. 67. Did you tell Mr. Drawbaugh that you thought that you had spoken of it to Smith?

"*A*. Yes, sir.

"*X Q*. 68. How long have you known Smith, and where did you first know him?

"*A*. I have known Smith, I think, since 1880; I ain't just positive; I got acquainted with him at Triumph, Ill.

"*X Q*. 69. When did you talk with him about the telephone?

"*A*. The fall of the same year that I first met him. It was while husking corn for B. J. Hall, at Triumph."

"*X Q*. 72. When was it that you told Drawbaugh that you would go and see Smith?.

"*A*. It was before I went out to Illinois."

"*X Q*. 104. Have you seen the dentist, Smith, since you first wrote to Mr. Drawbaugh?

"*A*. Yes, sir.

"*X Q*. 105. When did you see him.

"*A*. I think it was in February that I saw him."

"*Q.* 47. What caused them to come back to your memory?

"*A.* I was studying over being in Philadelphia and everything, and it come to my recollection that I had seen and talked with Mr. Drawbaugh on the talking machine.

"*Q.* 48. Do you mean, talked with him *by* the machine or talked with him *about* the machine?

"*A.* Talked with him *by* the machine, or that he rather talked to me by the machine.

"*Q.* 49. And you wrote to Mr. Drawbaugh informing him of it, in order that no injustice might be done by the mistake which you saw that you had made at Philadelphia; is that the way of it?

"*A.* Yes, sir."

He had done an injustice; and that made him write that letter.

Now let us see what he did. That is what he swears to as the truth. Well, after writing that letter to Mr. Drawbaugh, he wrote a letter to me, and this is the letter (defts, iii, surbtl, 243): —

"TRIUMPH, March the 8, 1883.

"FRIEND STORROW:

"I thought I would write you a few lines to let you know that I got home all right, and am feeling as good as ever, and to let you know that I herd from Dan, and that he wants me to come back again, and I have thought over some of my deposition, and I find that I have testified to some things that I wasn't right about, and would right them if I could, or would get A Chance, and hope that I will. I do now believe that there was a telephone there as far back as 1873" [he swore to 1875 finally, concluded to take 1875] — "and know there was, and know there was, and am glad that it has come to my rekalection, and am very sorry that I have give in the evidens that I have. I have had telephone on the brain ever since I got back, and I want you to wright to me and tell me what I had beter do. I can keep out of their way if you say so dont fale to write and give me advise, and tell Comfort that I still Play seven up sometimes. with this I stop, your

"Friend ORLANDO B. KAHNEY.

"Adres Triumph, Lasalle County, Ill."

MR. HILL. That is your witness, and not ours.

MR. STORROW. That is your liar. He is your *liar*.

Again: —

"MENDOTA, ILL., May the 23 1883.

"FRIEND STORROW:

"I thought I would rite you and let you know that I am getting along well and to ask an advise of you whether I had better or not come and testify on the on the other side Dan he says he wants me to come rite and let me know what you think about it.

"ORLANDO B. KAHNEY.

"Address Mendota, Lasalle County, Ill."

What would your Honor have done if you had got such a letter?

Would you have said to the man, "I will send you a check": or would you have put the letter in your pocket and kept it to use when he came along, and made no reply? My associates and myself of course made no reply. And that is the man upon whom they rely.

And now, on those facts, on those letters, which we left without communication of any kind between us and that scoundrel, they state in their brief to-day (pp. 305, 307):—

> "The extraordinary methods of the complainants in prosecuting this case ought to be looked into and strongly condemned by the Court. The most unscrupulous means have been resorted to at every point to prejudice the defendants and mislead the Court."
>
> "They refused to allow Orlando Kahney to return and correct his testimony, although he applied to them for the privilege of so doing."

That is the assertion they make; and they have brought a senator of the United States here to illustrate that, and to try to make your Honor believe it.

Now I turn to the instruments **D** and **E**. The story is that these were made in the spring of 1875,—February or March; about February, I think. This set, **C** and **I**, as your Honor remembers, are alleged to have been made five years, and this **A**, during the year before. This instrument, "**C** reproduced," I hope your Honor will not handle, as it is a dangerous thing. Let me prop it up so it will not tumble down; if the heavy magnet were to fall on your toes it would be very painful. Mr. Benjamin, who is a gentleman of intelligence, having a proper regard for personal comfort, as soon as he came to see this, put a clamp on there and screwed that heavy magnet down, so that disaster could not happen. Mr. Drawbaugh, a first-rate mechanic, a handy man in the use of tools, used that all that time, continually, year after year, so they say, and he never screwed it down! There is not any fastening to it, and there is no fastening to the block, no screw hole in the board by which it ever could have been fastened, and you could not handle it, and yet they expect your Honor to believe that story.

Their story is that, after making **D** and **E**, he made this pair (**L** and **M**), and this pair (**G** and **O**); then this (**H**), — this Blake transmitter, as we call it; and that, after making **H**, he made this instrument (**J**). The story is that **D** and **E** were made in the beginning of 1875; and next **L** and **M**, which were microphones and magnetos, in 1876; that Drawbaugh jumped at one bound from this broken tumbler **F** to these very refined structures, **L**, **M**, **G**, **O**; that these four, **L**, **M**, **G**, **O**, were made very nearly at the same time, and this **H** soon afterwards. And they produce witnesses, from whom they wish your Honor to believe that **H**, that Blake transmitter, was made in August or September, 1876.

Your Honor will remember Mr. Bell's patent was in March, 1876. Mr. Bell's exhibition at the Centennial was June 25, 1876; and by midsummer, 1876, he became famous everywhere. That was the time when he became publicly known in all the papers as the inventor of the telephone.

After making that Blake transmitter **H**, Drawbaugh, they say, made this (**J**). They say a year or two afterwards. Your Honor will see that this is the same thing, really. The difference is that the circular diaphragm of **H** is expanded in **J** out into an ellipse, and there are two sets of contacts on **J**, instead of one as in **H**. But all the parts and details are the same in both; **J** is only a double-barrelled **H**. Instrument **J** was made under a foolish notion that if you got so much result out of one set of contacts, you would get twice as much out of two. It is like an effort to make anybody believe that half a dollar is less in proportion to one dollar than one dollar is to two. It is the same sort of fallacy.

Drawbaugh testifies that he found in practice there was no advantage in this duplication, and that **J** was not a better instrument than **H**. He made this instrument **P** afterwards, which is no advancement on that **H**. It is the carbon microphone called **P**. Instrument **P** consists of a carbon microphone transmitter and a magneto receiver fastened to one board in a compact form. The only thing in this was connecting them together and fastening them on to one board, a mere matter of mechanical arrangement. Of course this microphone is a little differently arranged from that in **H**, but there is no difference of any importance; and Drawbaugh testified he did not find any particular advantage in this. He afterwards made this instrument **K**; but it is pretty hard to know whether he claimed to have invented it or not. It had been described in the newspapers two years before he said he made it, and it is what is called a rotophone. This crank is turned and a friction clutch is applied to it, which is fastened at the centre of the diaphragm. That friction clutch is controlled by a magnet which pulls it more or less. If it is pulled down hard, it drags the diaphragm rather hard back. If the friction clutch is applied gently, the diaphragm is not drawn so far back. By varying the pressure of the friction clutch on the wheel, you can pull the diaphragm more or less, and in that way vibrate it.

Now, that pressure of the friction clutch on the wheel is arranged to be operated by this electro-magnet, which in turn is operated by the varying currents which come from the articulating transmitter. In that way the current due to the articulating transmitter varies the attractive force of that magnet, and the pull of this clutch on the diaphragm. It is a machine which, even when properly made, gives results which, as Drawbaugh says, are not worth having. Drawbaugh never finished one. The mechanical imperfections of the instrument produce so many disturbances that the sounds are not true, although they are very loud.

The instrument was invented by three different inventors, independently of each other, Mr. Edison, Mr. Dolbear, and Mr. Berliner. A later improved form, made by Edison, has been known for some time, and with it you can get fair articulation and a loud sound; that is, you can hear it anywhere in an ordinary sized room. But Drawbaugh says he did not finish this, because the sound was so poor that it was not worth going on with any further.

Your Honor observes these statements in his history: That up to a certain time, the beginning of 1875, he had made those, **F**, **B**, **C**, **I**, **A**. Your Honor knows that no telephone apparatus made up out of those instruments will talk enough to anticipate a patent. The New York tests settled that question. Then came those curled magnet instruments **D** and **E**, **L** and **M**, **G** and **O**. Instruments **L** and **M** were origi nally microphones and magnetos combined in one box. He found that to be a poor plan, and took out the microphones and used what remained in **L** and **M** as magneto instruments. These, **G** and **O**, are microphones, — transmitters merely. You cannot hear at them, you can only speak in them. This set **D** and **E**, then, are the first really speaking instruments. They are said to have preceded the microphones by a year, more or less. Their allegations are that **D** and **E** were made in February, 1875, and that **H**, this Blake transmitter, was substantially completed in August, 1876, and that **L, M, G, O** came in between. I find in their brief, in one place, that they say **L, M, G, O** were made in 1875 *or* 1876; in another place, that they say *this* group, **L, M, G, O, H,** was produced after February 14, 1876, and that those instruments, **D** and **E**, antedate our patent; and they wish us to understand, I suppose, that those instruments, **L, M, G, O, H,** are the ones that came immediately after our patent.

Defendants' allegations:

D and **E**, the first real speakers, February, 1875.
L, M, G, O, microphones, March, 1876.
H, Blake transmitter, August, 1876.

Also: —

Mr. Bell's patent, March 7, 1876; application Feb. 14, 1876.
Mr. Bell's Centennial exhibition, June 25, 1876.

The condition of things then was, if their story be true, that fifteen or sixteen months before Mr. Bell's invention was generally known, and before he became famous in the world, in all the newspapers, as the inventor of the telephone, and even before the telephone was ever mentioned in any newspaper in the world, that Drawbaugh had had **D** and **E**; that he then had *this* group, **L, M, G, O,** a few weeks old, and *this* **H** nearly finished, or just finished.

He testifies that he heard of Mr. Bell in the summer of 1876, and heard of his speaking telephone exhibition. He thinks he read of it, but does not remember where, or in what paper (defts, ii, 858, 1048). He has an impression that he read it, or that somebody told him of it; but he does not remember where nor from whom he heard it. At the time when he heard it or read it, if their story be true, he had got **D, E, L, M, G, O** finished and in working order, and the Blake transmitter **H** just about completed. Now, there is no doubt about their excellence. I don't say that they are good for commercial use, but you can talk through them with proper skill and care. They are defective instruments, because they are liable to break contact. I have mentioned already the defects which run through these instruments, but they are good enough instruments to anticipate a patent, and good enough instruments to be put into practical use in skilled and careful hands. He never could have any doubt in his mind about his own priority, if he had **D** and **E** fifteen months before he heard of Mr. Bell; and if he had **L**, **M**, **G**, **O** before he heard of Mr. Bell, and was about finishing **H** before he heard of Mr. Bell, he never could have had any doubt in his mind that before he heard of Mr. Bell he had a good instrument. Think what a shock it must have been to a man, in the summer of 1876, after ten or a dozen years of work, having these instruments **D** and **E** for a year or eighteen months, and all these microphones just completed, just finished, to hear that another man was becoming famous as the inventor of the speaking telephone! Why, the very stones in the street would cry out if such a thing happened to them!

Let us see what this man thereupon did. There could be no doubt about the effect which those two instruments **D** and **E** would produce on any inventor who had been struggling with these things for ten or twelve years, if his story is true; and I will not stop now to criticise whether his story is true or not; I am now taking just what they assert, and asking your Honor what you will believe *on their record and nothing else.* These two magneto instruments **D** and **E**, if they came when he says they did and were what he says they were, must have produced a great effect upon him and upon everybody else. If he had been laughed at because he was trying to invent something which everybody knew could not possibly be invented; if he was walking through the streets with his head bowed down trying to invent a speaking telephone, why, he had got it there! All doubts were gone. The thing was done. He had been trying, but now he had succeeded. That is an epoch, that is a time, that is a fact, — if it be a fact,— which could not have failed to have impressed itself on everybody's mind; not only upon his, but also upon the mind of everybody about him. If he had had these magnetos **D** and **E**, think what would have happened. When people came in there, he would have shown them these telephones; if the story be true, everybody would have seen them. They would have been always ready; they needed no battery, no adjustment was required; you had only to take them up and talk through them. There could be no difficulty about proving those, — if there was a word of truth in that story. The handwriting on the wall was not plainer than would have been the effect of these instruments, — if he had made them.

Now, let us see what their record is about them, and what the proof is. In the first place, how material are they in the case? If I have time (perhaps I shall not, but it is in the brief, p. 516) I shall ask your Honor to look at the rules of law, and at the authorities (one in particular) as to the date which the law assigns to Mr. Bell's invention. Perhaps the most conclusive authority is the telegraph case — O'Reilly *v.* Morse. There, a foreigner had published his invention in June, 1837, and, to sustain Morse, the date of his invention, the date which the law assigned to him, must go back of that. Now at that time — June, 1837 — Morse had not made an instrument. He had not put his invention upon paper. Four months after that he filed a caveat; that was the first thing. But the Supreme Court said that they were satisfied he had worked out in his mind the plan of his telegraph, and the character and nature of the instrument which he afterwards described in his patent; and that that was enough. That and many other authorities are collected in the brief, which your Honor will go through, of course.

Those instruments **D** and **E** are not alleged to have been made until after Mr. Bell had disclosed his invention to Dr. Blake and Prof. Cross. We understand the rule to be that a defendant, to anticipate a patent, must set up a practical machine at a date earlier than that which the law assigns to the successful patentee as a date for his invention. If that be so, that is an end to the case. But I go on now, regardless of that, to see whether they were or were not made before the issue of our patent.

To prove that they were made before, they have got memories, and nothing but memories; the same kind of memories which I have been discussing for half a day or a day. That is all, and there is but very little of that. We have collected the matter about those instruments at the latter end of the brief, beginning at p. 450.

Drawbaugh was asked on his direct examination (p. 452 of the brief): —

> "*Q*. 259. To what extent did you use the instruments D and E?
> "*A*. I used them very often; I couldn't state how often.
> "*Q*. 260. Did anybody talk through them or listen through them besides yourself?
> "*A*. Yes, sir; a great many persons. What I mean by that is a great many persons who come to the shop there."

If that be true, we shall have a great many persons listening through them, from the time they were alleged to have been made, and before the grant of the Bell patent. We shall have a great many persons listening through them during the year after the time they were alleged to have been made, and before the date of the granting of the Bell patent.

In the first place, if we apply to the *Drawbaugh family*, we don't get much information out of them. I will speak of Daniel Drawbaugh presently. His brother John has seen them, but he doesn't know when. His brother Henry says he began to run his line of freight cars in May, 1876; and his recollection is that he saw D and E some time before that, but he cannot tell in what year. Afterwards he says he rather thought on the whole that it might have been in the summer before, but he says squarely that he can't tell in what year it was. Mrs. Daniel Drawbaugh, as I have already said, they did not call. George, the nephew and the next-door neighbor, was called. The difficulty with his testimony is that he says he saw them, but he don't know when. He was not even asked when he had ever used one of them. Upon all those members of the family, startling as these machines would have been under these circumstances, they made no impression. Harmon Drawbaugh, the nephew, says that he made them, under his uncle's direction, of course. He is the only one in Mr. Drawbaugh's family who gives any help. We shall examine his deposition by and by, and see just what it means. For the Drawbaugh family, see brief, pp. 456-468.

I now want to take up the witnesses (beginning on p. 469 of the brief) who say they heard speech through those instruments before the date of the Bell patent.

William H. Decker (brief, 469; abstract, 251).— He heard them six months before the time when Harmon Drawbaugh says that he made them. He says that he heard them in the commencement of the fall of 1874; Harmon Drawbaugh says that he made them in 1875. Let them settle that quarrel as the please. Decker is the man who heard about Jacob May's baby a year before that was made also (p. 184, *supra*).

Jeremiah Fry (brief, 469; app. 43). — Kept the store at Eberly's Mills. He lived there from the spring of 1875 to the spring of 1880, right alongside of Drawbaugh. At the time he kept the store he was right alongside of Drawbaugh. He began to keep store in the fall of 1875. He was the one who began to keep the store after it was blown up, which was in January, 1875. He says that he saw them, and he was sure it was the 9th of April, 1875; he was sure of that date, because he sold some potatoes to Drawbaugh, which he had raised on a particular farm; and he is quite sure that is the time when he saw them. Of course that is not enough to fix the date; but there is a good deal about his testimony which is valuable. Those are instruments which would talk, and talk well; not very loudly, but well and perfectly plain. They asked the witness Fry (defts, i, 150): —

> "*Q*. 14. Did he talk through any of the machines to you at that time?
>
> "*A*. He sang."

And that is all he knows about it. "He *sang*." Are you going to believe that when Drawbaugh had those talking instruments, the first that really talked, and made an exhibition of them to this witness, that all he did was to *sing* through them? It is impossible that those could have been talking machines, or that he could have heard **D** and **E**; or else he got the date wrong, and got the whole thing mixed. What effect did that exhibition produce on Fry? Why, he says that he talked with several persons about it, whatever it was. His statement is: "I talked with several persons; that is a very good thing, if he gets it accomplished." What! Have instruments like those, and the only use made of them to sing! And the effect produced on that man be, "It is a good thing, *if he gets it accomplished*"; and the neighbors thought so too. Why, the tin-can and tumbler instrument will produce that effect, will do that thing, but **D** and **E** are *talking* instruments. That witness doesn't hurt us.*

Isaac B. Millard (brief, 470; app. 90). — He has nothing but memory. He began by saying that in 1869 he talked through the tumbler and tin can, and heard perfectly well. That was an impossibility. He says that he heard it over an outdoor line which ran from the shop out on to the bank; but, according to the description of his circuits given by Drawbaugh, no such line existed for eight or ten years after that. Afterwards, in 1877 or 1878, such a line did exist, but that was after telephones were known everywhere. Then he says he saw **D** and **E**, and he tries to state the date. First, he thinks, as near as he can get it from a vague recollection, that it was in 1874. That was before the defendants say they were made. Then he thinks along somewhere in 1875 or 1876. Finally, he thinks that, on the whole, he has not been at that shop since the winter before the Centennial, and he must have seen them then. His testimony about the instrument is worthless, for his memory is very vague, and he has no means of fixing the date with any degree of positiveness.

Daniel Fettrow (brief, 470; app. 94), a very important witness. He was the blacksmith at Eberly's Mills; the only mechanic who lived there besides Drawbaugh; Drawbaugh's tenant and the man to whom I have already referred. He testified that the first time he ever saw a talking machine or that Drawbaugh ever spoke to him about one was in March, 1875. Now, think of that! The only mechanic in the village, interchanging work constantly with Drawbaugh, *living under the same roof with Drawbaugh ever since* 1868, yet never was spoken to on the subject, and never saw one of them until 1875, so he says. And yet they want you to believe that eight years before that, and during the whole of that time, there had been a perfect instrument there, and that everybody knew of them, and they were the chief thought and chief occupation of Drawbaugh's life. He had heard, he thinks, something about it before that; and this is what he had heard (defts, i, p. 366):—

---

* Jeremiah Fry testified, defts, i, 156: —

"*X Q.* 67. Did you ever, while you lived at Eberly's Mills, talk with other people besides Mr. Drawbaugh about his talking machines?

"*A.* Yes, I talked with several persons; that it is a very good thing if he gets it accomplished.

"*X Q.* 70. Did these people that you talked to about it think it would be a good thing if he got it accomplished?

"[*Objected to.*]

"*A.* Yes; *they all allowed it's a very good thing.*"

"*Q*. 26. You had heard" [this is what I call a leading question]—"you had heard his talking machine spoken of in the neighberhood before, had you?
"*A*. Oh, yes.
"*Q*. 27. What did people say about it?
"*A*. Called it tomfoolery."

That is all he knew about it—a man *living in the house with Drawbaugh for eight years*. That was the extent of his knowledge. What is the use of bringing loafers to testify to the existence of perfect talking machines, and that everybody knew of them, when this fellow mechanic, under the same roof with him, knew nothing about them? That is not all. There were some other people under the same roof who didn't know. They did not call Mrs. Drawbaugh, and I confess I do not see any sufficient reason why they should not have called her.

Again: this Fettrow has a son, William, who has been spoken of again and again as a frequenter of that shop. He was twenty-one years old in 1879; he was old enough in 1875, or before that, to have known all about it,—older than some of the witnesses whom they called. He has been around Milltown and Eberly's for years. In fact, he was one of the company present at the interesting meeting of which I have spoken, at Drawbaugh's shop last winter, when they talked over this case, when the Ditlows were present, and before they came back with changed views and recollections. He was present at that meeting; they don't call him (brief, p. 293; app. 103). They can't get anybody out of that house to help your Honor to believe that these things existed during most of the time alleged, or who will themselves believe that part of the story.

Now, Daniel Fettrow says that he knows it was about March, 1875, because he was there doing a job for the Axle Company; that it was while he worked for the Axle Company. But he had been for years and years before and since doing all the blacksmith work required to be done for the machine work going on in that shop. His own account book shows that he worked for that Axle Company every few days for fifteen months after that. He has work charged to them as late as the 1st of September, 1876. His books show that, and he so testified. What has he got to fix it by? Well, he thinks it was the first thing he did; not the middle, or the last, or some other thing. That is all. Well, if that is competent testimony, it is of the weakest kind. No man would rest a date on such evidence as something which could free his mind from doubt, if there was the least ground for suspicion, even if there was no evidence to counteract it, no weight of testimony to meet it.

But that is not quite all. He said he saw this instrument, and he recognized it by that "*curled magnet.*" That is a pretty good thing to recognize it by. Many of the witnesses say that they recognize it by that curled magnet. The instrument as made had a covering on it like **E**; Mr. Drawbaugh so testifies, and that concealed the magnet. After a while the cover got lost off. He doesn't say how. It could not have been very early, because he had no occasion to take them apart, inasmuch as he says that he never made any change in it. You cannot get off that cover of **E**; this adjusting screw prevents it dropping off. You have got to take it all apart, or deliberately loose the cover, or smash it. You couldn't use it long without a cover. Those screws now on **D** and which now hold the magnet have been put on recently for the purpose of this case. In that instrument the magnet is held a little way off from the bottom, and is fastened only by that little pivot at the centre. Put that in a man's hand, and let him grasp it tightly, to hold it to his ear, and you inevitably shake the magnet or bend it, and it gets out of order. And that is what occurred in this suit, so that when this **D** came to be tried, it was necessary to put a couple of screws and a block of wood in there, to hold that in place, just for a few hours' test. No one would ever think of using that with the bottom off. Now it is said by Fettrow that he saw that thing, when, if their story be true, and if his date be true, it was not a month old, and that he recognized it by the curled magnet; so that the bottom was lost then. They haven't got a witness who ever saw a bottom on that. They all, or pretty nearly all, recognize it by the curled magnet, — early and late. How does that happen? Are you going to believe that within two or three weeks after it was made the bottom of the box dropped off, when the adjusting screw keeps it there, and that it was then lost and never replaced? Impossible! This is shown to them now, and the curled magnet is conspicuous; so they catch on that. One man (Updegraff) says he remembers it because it was like the curl of the ear. He saw it, according to his story, a week or two after Fettrow did, when it was not a month old, if their story is correct. He sees the curled magnet now, and thinks he recognizes it. He does not know that he didn't see it in former times; he doesn't know that when he says he was at the shop it couldn't be seen. He is now ready to swear that he recognizes it by that, and yet he never saw it in the world. That disposes of that class of witnesses. I mean it shakes your confidence in that kind of testimony. As to recognition by the curled magnets, see brief, pp. 471, 479.

One more thing about Mr. Fettrow. Harmon Drawbaugh (for I may as well take the evidence up at this point about that; it will be found on p. 500 of the brief) assisted in making **D** and **E**, he says, and he testifies in this way: —

> "*Q.* 131. Who made the curled magnets for those two machines [**D** and **E**], if you know?
>
> "*A.* He [Daniel Drawbaugh] made the one for the first one, and forged it and shaped it, and I made the other, I think; there were several, — quite a number of them made, — and I know that Fettrow made a couple, but I don't know which of them were used."

Several magnets were made. He forged one, Daniel Drawbaugh forged one, and Fettrow forged a couple. All agree that those four magnets were made when the instruments first were. At any rate, Drawbaugh swears that he never touched the magnets since (defts, ii, 1107, ans. 1700). Plainly the meaning of that testimony is that Fettrow forged two magnets at the time **D** and **E** were made, and Daniel Drawbaugh and his brother, another (the witness does not know which), but that they were all made at the same time. The defendants take that view of it. Our witness, Mr. Pope, testified that those were rather weak instruments; and they wanted to get him to admit that the magnets might have lost their magnetism; while good magnets made of a particular kind of steel — as tungsten steel — will preserve their magnetism longer. The defendants' counsel asked Mr. Pope (complts, ii, 1450): —

"*X Q.* 401. Assuming that Drawbaugh made the instrument **D** and **E** in the early part of 1875, and that he either made the permanent magnets himself, or employed the village blacksmith at Eberly's Mills to forge them for him, would you expect them to be made of tungsten steel, and would you not consider it highly probable that they would partially lose their magnetism in the course of seven years?

"*A.* I don't think they would be likely to be made of tungsten steel under the circumstances; and hence, it is possible that magnets so made might lose a portion of their magnetism during the length of time mentioned."

Now in order to prove the poverty part of their story by Fettrow, they put into the case a copy of his account of *all* his dealings with Drawbaugh from 1868 to April, 1876, which embraced *all* his dealings with Mr. Drawbaugh from the year 1868, and showed everything that he had let Drawbaugh have, so he says (defts, i, 370; defts, exhibits, p. 6). There are in it little items of five and ten cents, for pieces of forging, pieces of iron, nails and so on. Between April, 1874, and April, 1876 (at which time that account ends), *there is not a charge for a magnet; there is not a charge for a piece of steel out which the magnet could have been made; and there is not a charge of any kind which by any physical possibility could have included those magnets.* Now where are we? *That is the only piece of paper that connects itself with any of those instruments.* That is the only time, in the whole case, where there is any proof of the origin of anything used in these instruments. Where does that carry us? The account ends in April, 1876, when Fettrow's relations with Drawbaugh ceased. He then bought his house, and Drawbaugh moved to Mechanicsburg.

E. R. Holsinger (brief, 472; app. 103). — He is the man who proved that Drawbaugh's "whole heart and soul," and his too, were in the talking machine; but which he and Drawbaugh unfortunately omitted when he printed that advertising card, and which Holsinger forgot to mention when he mentioned other things which he did, the clock, etc., in the newspaper article. Your Honor will read this deposition. It is the deposition of a fanatic,—of a fanatic almost on the edge of lunacy. He is full of that power of exaggeration, of self-delusion, of seeing the thing which is not, stronger than the thing which is, and believing it himself, which belongs to that class of men, as you will see by his language and the manner of his deposition, and in the substance of it all through.

Now, may it please your Honor, I have not been long, *but I have named every witness called in their case in chief who pretends to have talked through these machines* **D** *and* **E** *before the date of Bell's patent.* Six witnesses in chief are all who pretend to have talked through them; and such they are. Even they do not all say that they heard talk. Take Fry: did he talk through them? No; he "sang." Decker saw **D** before it was made, and so on and so on.

After that we came to the New York tests. Apparently, one may conjecture, as the alleged reproductions of the alleged earlier instruments had not been tried when these witnesses testified, that the defendants thought it was as fatal to us for them to prove the glass tumbler **F** and the tin can **B**, as to prove **D** and **E.** I don't know whether that was so or not; it is conceivable, however. But the New York tests settled it forever that nothing could carry this case except the instruments **D** and **E.** These are the only instruments which, as matter of law, can defeat Mr. Bell's patent.

Then the defendants went to work and took surrebuttal testimony for a year; and they had had a year to get ready in, while we were taking our proof. They took the testimony of two hundred and thirty-eight witnesses. They did not confine themselves to surrebuttal; they brought in cumulative witnesses, which was natural, perhaps, under the circumstances; they brought in large numbers of purely cumulative witnesses.

Now, of course, we are going to find lots of witnesses — lots of witnesses — who saw these machines **D** and **E**, because Drawbaugh says that a great many used to listen through them. The defendants had been warned that they were the crucial instruments. But *out of all that fine-tooth-comb work, which gave them two hundred and* *thirty-eight witnesses, they could find but two men who dared venture to pretend to think that they had a kind of a sort of a memory that they had once talked through those things* D *and* E *before the Bell patent came out.* They had some others who saw them, — that is all. I will call your Honor's attention to those two, and I think you will find those two are enough to dispel all confidence in the defendants' case.

John Simmons (brief, 474; app. 569) is the first. There is a curious story about him. I have spoken of some witnesses whom we had and whom the defendants brought back, — the Ditlow family and Kahney. We also had to testify for us at the same time one Jacob Evans, a brother-in-law of the Ditlows. He had lived at Eberly's Mills, and had run the mill — not as owner of the mill but as journeyman — for a good many years, from 1874 down to 1881, I think, or until after the time when this controversy began. He then moved away a few miles to another mill. While the defendants were taking their testimony in chief, they went to see him, brought him to Harrisburg, examined him privately, showed him the instruments and sent him home; they did not call him. Then we went to see him. He said that we need not trouble ourselves; Drawbaugh had shown him all the exhibits; he never heard of any at any time material to this case; he never saw any instruments; never heard Drawbaugh had a telephone until 1877, — after the Bell patent. We called him, and he swore to that. He appeared to us to make a pretty good witness. He and his wife were neighbors of Drawbaugh's, intimate personal friends of Drawbaugh's, and visiting there during the progress of the suit. They could not find in him or her any recollection to help them; and we called him to testify to exactly what he had told them a year before we ever went to see him. When the Ditlow family came on the stand, he came back; but he didn't know much. It was pretty hard work for him to swear to anything; but his wife, his sisters and his brother all told a story to the effect that, on the 5th of *December*, 1875 (and they fixed the exact date, if they fixed anything), they came to visit him and his wife, and they all went down to Drawbaugh's shop and saw the talking machine, and Drawbaugh talked through it, and Jacob Evans listened; none of the others listened; they looked at the other things in the shop;

but while this was going on they had not curiosity enough to listen; I think, on the whole, that Andrew Evans, the brother, bears the palm over everybody else in this case for obtuse stupidity. Jacob Evans could not remember what he had seen. They didn't ask him to identify the instruments: when he was on the stand for us he swore he had never seen them. Some of those who were with him thought they saw or saw him use **D** or **E**; I think that one of them thought so. The others didn't know; that was the extent of his knowledge. For the Evans family see appendix, pp. 562–582. The falsity of their story is there conclusively shown.

After that comes along John Simmons; and John Simmons says: "Why, I know all about these instruments; I went to that shop in *November*, 1875, with this same Jacob Evans, and he and I and Drawbaugh talked through this machine, and we talked through **D** and **E**." John Simmons professed to be a first-rate witness. He knows all about it, and he tells a curious little story, the substance of which, as near as I can make it out, is that, with the instrument lying on the bench and he away off by the stove, he could hear it talk. I do not know that that is quite clear, but that seems to be the description of the situation, and that is the account that he gives. Who is John Simmons, and why did they not call him before? He is a neighbor, — a next-door neighbor, — and he lived there in the village during the whole time of this controversy; and the question would naturally arise, Why did they not call him before? He not only lived in that village, but *he has been employed in the shop of these people all through this controversy; has been employed as a workman in Drawbaugh's shop at Milltown.* They talked to him early in the controversy — at least Drawbaugh and Chellis did — about this suit and about this matter, but he never let on that he knew anything about telephones. Finally, he says that he never told any human being about listening through **D** and **E** until the morning he testified, and that then he told one of the defendants' counsel.

That man thought there was a market for that kind of testimony, and he proposed to supply the demand, and that is all you can say of him.

George A. May (brief, p. 474; app. 679), son-in-law of the blacksmith, Daniel Fettrow, is the other witness. He married

Fettrow's daughter in 1878 or 1879, and lived in Fettrow's house during all the controversy, and has lived right alongside of Drawbaugh in that village. I am not sure that he may not be a worthy rival of Andrew Evans, for stupidity. He testifies that he went to Drawbaugh's shop, and talked through a pair of instruments in March, 1875; and he knew that was the time, because he got Drawbaugh to sharpen a razor for him; and he knew that because, when he went to carry the razor to him, Drawbaugh was living in a particular house, which he moved away from in 1876, — the same house that Fettrow lived in. Well, that was quite as good as any other worthless association; but when we came to cross-examine him, he could not tell who he had worked for, nor the people he had worked with, since 1875; he could not tell the place nor give an accurate story; nor, in fact, twice repeat the same story. I don't mean men he did little jobs for, but men he regularly worked for. He could not tell whether he worked for a certain man in a certain year, and, in fact, he got all mixed up. But that is not all. There has been a good deal in this case of thrusting a particular instrument before a witness and asking him, "Did you see that?" "Did you see that instrument at the time?" That has been done all through their testimony in this case. There has been some little chaffing between counsel, in a pleasant way, on the subject; and when the witness, George A. May, came to be examined, they put before him quite a number of instruments, and asked him which instrument he saw at the time of this visit, — the only time he had any knowledge of the machine. He said that he saw **D**, **E** (the little magnetos), **F** (the tumbler) and **H** (the Blake transmitter). "Where was this (**H**)?" His reply was that it was fastened up against the wall. He was quite sure that it was fastened up against the wall in March, 1875. *But they do not pretend that that instrument* **H** *existed until eighteen months after that!*

May it please your Honor, those are the only two witnesses they could find, who dared to pretend to have listened at these two crucial instruments after two years' search, — a search that revealed, among two hundred and thirty-eight witnesses, only two such men as that. Could you get better proof against the existence of those instruments than the fact that under such stimulus, knowing the case would turn on that pair of instruments, they found only two witnesses who would testify as to any attempt to use those machines at that time? Why were not those witnesses produced before? Living right alongside of Drawbaugh in the same village during the whole of this controversy, of course they must have heard it talked of. Simmons was in the employ of these people. May had been working in that village all that time; he had been working for several witnesses for the defence in this case; he had had three years' gossip poured into his ears. "Had he ever been spoken to about it before?" "Yes." We asked him when (defts, iii, surbtl, 994): —

> "X Q. 140. When were you first asked what you know about Drawbaugh's talking machine?
>
> "A It was about two years ago" [that was about the time they were taking testimony in chief]: "Dan asked me whether I didn't mind the time he showed it [a talking machine] to me in 1875."

When asked this leading, suggestive and instructive question by Drawbaugh two years before, what did the witness answer? We don't know; but *they did not call him then.* He had been living in the village all the time; they could have called him before, but when they did call him, he swears he saw **H** in March, 1875, eighteen months before they pretend that it was made.

These are all the witnesses in the whole record who pretend ever to have talked through **D** *and* **E**. *Two of them swear to it before it was made; one of them heard no talk, but a song, and so on. Eight only in all; eight only out of three hundred and sixty-six called, and half of those eight discredited on the face of their own depositions* (brief, 473).

Now I want to call your attention to the testimony of witnesses who say that they *saw* **D** and **E**, but did not attempt to listen. On page 478 of the brief you have the citations; there are not many of them. What is the value of the testimony of a witness who says that he went to Drawbaugh's shop, was interested in his affairs, and spent five minutes, or ten minutes, or an hour talking *about* these two instruments, but never talked *through* them, — instruments which were always ready, no battery required, no adjustment necessary,— instruments that would work without the slightest trouble?

What do you think of such a witness? How are you going to believe a witness who says that he went there, was interested, talked for half an hour or an hour with Drawbaugh about these machines, and Drawbaugh puts one of them to his mouth and says, "This is the way you talk through it," and puts another to his ear and says, "That is the way you listen," and yet the witness did not put one to his own ear, or assist in the conversation which might be carried on through it, who did not listen to it, did not try to talk through it? You do not rest a case on the testimony of such witnesses. It was not these instruments that they saw.

Rufus K. Shireman (brief, 478; app. 79). — He says that in the fall of 1873 he first saw at Mr. Drawbaugh's shop **B** and **F** (the tumbler and tin-can instrument), which Mr. Drawbaugh told him belonged to the talking machine; but he did not speak through them. Not more than three or four months afterwards he made a second visit to Mr. Drawbaugh's shop and saw **B** and **F**, the tumbler and tin-can instruments, and talking machine, and he says that at that time he listened at a machine which he does not undertake to identify; he says, "It was fastened against the north wall of the building." He says he was standing away from the instrument, which was thus fastened up on the north wall of the building. Now there are none of those instruments that could be fastened up against the wall of a building. **H** was a transmitter, which could be fastened up, but it was not made until some three to eight years afterwards. No machine which is alleged to have then existed could be fastened up against the wall of the building; yet he says that the instrument he listened through was fastened against the wall of the building. There were quite a number of other witnesses who say that; but no such instrument existed. They have got something mixed up with it. A string telephone would naturally be so arranged. At later visits he says that he has seen various machines. He says that he saw **E**, **A**, **I**, and **D**. The defendants did not ask him when he saw them first. We did. We asked him what he saw at the time of his second visit, which he says was about three or four months after (not more than four months after) the fall of 1872; and he picks out **E**, **A**, **D** and **I**. One of those magnetos he says he saw at the second visit, not more than three or four months after the fall of 1872. As to **A** and **D** and **E**, the defendants *do not pretend that they were made* *for years after that.* Now does that witness simply wipe himself out, or does he shake your faith in the whole gang of them? On the face of it he appears to be as good as any of them.

Daniel Rupp (brief, 478; app. 121). — I do not know whether he swears to the time of this instrument or not; the date which he names is July, 1874, as I read it. If he gives any date at all, it is July, 1874. Well, they were not made then, according to their story. They confess that that was six months before they say they were made. He thus testifies to seeing them six months before the defendants pretend they were made. Whether he meant to assert that, or to assert no date at all, I am not quite sure; but your Honor will find out. He never used them; but his testimony has a good deal of value in one way. He was a member of the Mill Bush Company, — the company that made mill bushes in Drawbaugh's shop for some time. He was the treasurer, and was in Drawbaugh's shop in 1869, and spent a good deal of time at that shop, as the treasurer of the company. He had also been at Drawbaugh's shop a great deal about faucets. He had known Drawbaugh from boyhood, and lived pretty near him,— only a few miles off. According to his story, he had no knowledge of the talking machine until 1874. That looks pretty bad. He was engaged there in the shop, carrying on business in the shop, in 1868 and 1869, but does not pretend to any knowledge of the telephone before 1874. When they came to the surrebuttal, and were fixing up things, they thought they would fix up his testimony, so to speak; but they could not get Daniel Rupp on the stand again, and so they took the same course they had taken about the testimony of Henry Drawbaugh, but in a good deal worse way. They brought a man who says that he overheard a conversation in Daniel Rupp's store in 1871, about Drawbaugh telephone, but that Rupp was *not* present (defts, iii, surbtl, 378).

Jacob S. Shopp (brief, 479; app. 110) says that he saw **D** and **E**, but never talked through them. He thinks he was there in the year 1874 or 1875, but he has nothing to fix the date by. The defendants' counsel, in examining him, apparently tried to get him to fix the date by having him swear to the time when he had a pump fixed or repaired, and that he saw this when he came there for the pump, but the witness says that no such incident took place; "1874 or 1875" shows a recollection too vague to prove any date. He is a little worse in some respects than the other witnesses. He says that Drawbaugh told him, in the spring of 1876, meeting him somewhere, that he was going to exhibit his telephone at the Centennial. Now, no witness gives a hint of that except this fellow, and Drawbaugh does not pretend to. It has been published in the newspapers that he was going to exhibit at the Centennial *with a clock*, not a telephone (p. 97, *supra*).

W. H. Decker says that he saw and heard through **D** in 1874. So these two are witnesses who, if they prove anything, prove that they saw it before the defendants say that it was made.

Jacob B. Fry (brief, 480; app. 37), moved to Milltown, April 1, 1875, when he was about fourteen years of age. He says that, according to his recollection, he never talked through **D** and **E**,—at any rate, not at that time; that he did a little work for Harmon Drawbaugh, who was working for the Axle Company; and that, according to his recollection, it must have been about May or June, 1875. Well, on putting together the dates, the facts, and the sequences,—I will not stop to read all through the testimony,—it is quite plain from the incidents to which he refers, that the time of the employment there was in 1876, and not in 1875. In 1876 Harmon Drawbaugh (that is, Daniel Drawbaugh's brother) was doing piece work, and that was the time he employed this boy to help him, and not the time that he was employed by the day. The boy destroys their story or goes to pieces, or both.

C. E. Updegraff (brief, 483; app. 247) says that he saw **D** in April, 1875, and that he recognized it by the curled magnet. He is the quack doctor who talked with Zacharias at Hake's mill, a year before the time when Zacharias testifies that he went there; and who bought the provisions at the grocery store after it was blown up. Of course there was no "curled magnet" visible then if their story be true; the bottom was then on **D**, and the magnet covered. See pp. 187–9, *supra*.

Jonathan Balsley (brief, 483; app. 38) says that his wife died Oct. 22, 1875; and that soon after, to divert his mind, he went to Milltown, where he had formerly lived. He does not state whether he has been at Drawbaugh's shop at other times or not. He is a blacksmith. He remembers that he saw the instruments **F**, **D** and because he took notice of the curled magnet. I don't think your Honor will believe that he ever saw the curled magnet; he must be mistaken about that; and there must have been some confusion of ideas. He never saw the curled magnet, for the bottom must have been on. We refer to his testimony on page 484 of our brief. He stayed there an hour and talked with Drawbaugh about his inventions; was much struck with them; says that Drawbaugh explained the operation of the talking machine and all about the invention. He states that Drawbaugh put it to his mouth to show him how it was used, and that he put it to his ear; but he says that he never talked through it. Can you believe that? He might have done that with the tin can and with the tumbler, which would not talk. It is not possible to believe that kind of a story. It is not possible to believe that if he had any such instruments as **D** and **E**, he went through that performance and did not talk with them.

Daniel B. Condry (brief, 484; app. 43) stated that he has lived in the same place, about a quarter of a mile from Mr. Drawbaugh's shop, ever since September, 1875; that about Christmas, 1875, he saw some talking machines there, and thinks that **D** and **E** were two of them. He also stated that he had frequently been at Drawbaugh's shop since, and that he had seen there talking machines, but he does not identify anything else that he saw. He did not remember anything else. He was asked what business was carried on at that time, when he saw those talking machines, and as near as he could get at, it was the clock business. Now the clock business was carried on in 1877 and 1878; and the axle business was carried on in 1875. His deposition is not very definite, but what he thinks and what he remembers as to the time, as he puts it, are fixed by the time that the work he then saw was on clocks, and that did not begin there until some time in the summer of 1877. Nothing to fix any date by.

Jacob B. Shettel (brief, 485; app. 63) is a witness, of whom I have spoken, who was a partner in the clock business with Drawbaugh, and who at one time loaned Drawbaugh five cents and would have loaned him fifty dollars if he had asked it, but he never did (p. 216, *supra*). *He never attempted to talk through a telephone*. He was very frequently at the shop. Thinks he saw **D** and **E** "about

1875," but he cannot fix the date; he was unable even to state it any more definitely.

This witness hurt his character very much by his testimony about Drawbaugh's "poverty." He was a nephew of Drawbaugh's brother, and had known Drawbaugh from boyhood; a man of means, negotiating for a year about going into the clock enterprise, and did go into it; but he swears explicitly that he never heard Drawbaugh talk about patenting a telephone, and never was asked to advance money about one.

John H. Stephens (brief, 485; app. 76). — He has been a constant visitor at Drawbaugh's shop from 1870 up to the present time, sometimes twice a day, and sometimes two or three times a week every year; "sometimes I missed for a couple of months that I didn't get there" (ans. 22 and 23, defts, i, p. 232). He says that he saw **D** in 1875, but there is nothing whatever to enable him to fix the date. Did not use them. We introduced evidence which showed that in the fall of 1876 he returned from Drawbaugh's shop; said that he saw Drawbaugh at work on a talking machine, and mentioned it as an entire novelty.

That evidence was particularly from his hireling, George Rowe. Stephens testified that after he first saw the talking machine he spoke of it to his hireling and to his wife and daughters. He referred Drawbaugh to George Rowe as the hireling, and, in consequence of that, Drawbaugh saw George Rowe and inquired of him about it. George Rowe has testified that Stephens did mention the thing to him upon returning from Drawbaugh's shop, while he was hireling for him, and mentioned it as a novelty; but he never worked for Stephens except in the year 1876, and this incident took place in corn-husking time, October, 1876, and several months after the newspapers had been describing Mr. Bell's telephone. The defendants did not call Stephens's wife or daughters.

J. M. Wisler (brief, 486; app. 112) is a witness of the same kind. He had been at Mr. Drawbaugh's shop a good deal; had known him twenty years. Says that he visited Drawbaugh's shop in 1875, and saw these things, and that he put them to his mouth and ear, and that Mr. Drawbaugh showed him how they were used, but did not talk through them.

George L. Hale (brief, 486; app. 134) is another witness, still more vague, who can bring nothing to fix the date in his memory. He thinks that he went there in 1875. He was employed near Milltown. He has no recollection of having been there afterwards. He is a man whose deposition cannot, in the nature of things, be directly contradicted, and is therefore weak. He has heard these stories, which everybody had heard in that neighborhood and county for the last four years, and has got things confused.

What he says he saw was **C**, the breastwork instrument with the large permanent horseshoe magnet. He professes to recognize it chiefly by the magnet. Undoubtedly what he saw was the magneto key, the most conspicuous thing in which was just such a large horseshoe magnet with an electro-magnet at its end.

Jacob R. Vanasdale and *Jacob R. Ensminger* (brief, 486; app. 668–9). — These two men say that they were employed in the neighborhood of Milltown in February, 1875, which is likely enough, although the statements they make about their employments together do not agree with the book they produced. They also state that while there employed they went to Drawbaugh's shop and saw some parts of machines not put together, and think they recognize the curled magnet of **D** as one of those parts. They are men of the neighborhood. Whether they had been there at any subsequent time or not, and what they did see when they were, rests purely upon their memory. The value of their testimony rests entirely upon the excellence of their memory and their veracity. In the nature of things, we cannot directly contradict it. It is therefore specially significant that they are eleventh-hour witnesses, called in the last year of the case to a point that needed much bolstering.

W. H. Bates (brief, 487; app. 119). — In many ways an interesting witness — a sample witness. He was a blacksmith and carriage maker. He had been a friend of Drawbaugh's for many years and had worked for the Faucet Company in the fall of 1868. In 1872 and half of 1873 he was away living in the West, and then came back to the neighborhood. He says of Drawbaugh (ans. 24): "We were very intimate friends, and I went to see him pretty often and we exchanged opinions about mechanism."

From 1874 to fall of 1877, Drawbaugh did a good deal of work for him turning axles. He thinks that in 1875 he saw D and E, yet he never talked through a talking machine in all the years he visited at Drawbaugh's shop. Now to begin with, the fact that such a man, who was intimate with Drawbaugh under such circumstances, and who had worked for the Faucet Company, should know nothing of this thing until seven years after, is remarkable. His story may or may not be true, but is it possible, under these circumstances, that he never heard of or saw the talking machine during the time of the Faucet Company, or before 1875, if there was one there freely shown? Is it possible, if there was a machine there that talked, that he never saw it, and never tried to talk through it?

I hope the Court will look at the deposition of this witness carefully, especially as examined in our brief, pp. 487–9. He is an example of a witness who professed to have known all about all Drawbaugh's inventions, and who, from his intimacy with Drawbaugh, must have known of all of them; and from the fact that it was mechanical subjects which generally engaged their attention, he would certainly have used them Yet his story is, that, though they must have spent days in talking about the telephone, he never talked through them; and further, although we know (p. 155, *supra*) of the things that Drawbaugh was working upon during the very time when this man frequented the shop, such as his magneto key and all his other contrivances, there is no trace of them in this man's memory. He testified: —

> "*A.* 23. His general conversation was about talking machines: several times that I was there his mind seemed to be taken up with it. He said he would like to get it patented, but he hadn't the means to do it. He said he could make a fortune out of it."

It is perfectly plain that he is of those who find in their minds that Drawbaugh was always busy upon inventions, perhaps upon electrical inventions, and now transfer the whole to the talking machine, which they never heard of till afterwards. It is perfectly certain that if the talking machine occupied that place in their discussions which he now pretends, and D and E and the microphones existed, he would have talked through each of them the first instant he ever went there.

That is all the proof there is to sustain D *and* E. I have named over all those who profess to have seen or talked through these machines before the date of the Bell patent, — nineteen or twenty in all. Now, let us see what there is *in their own record to disprove their statements.* In the first place, the occupants of the shop during that time (particularly during the time the Axle Company carried on business there, from the beginning of 1875, when they began to put their machines in, until the fall of 1876, when they stopped) could not have helped knowing about these machines and using them if they existed. There were four partners in that concern, which was built on a patent; two of them went out in the spring of 1876, and the other two remained until November, 1876, and they were doing some active business until late in that fall, but I do not know exactly when; they certainly were in September, 1876. Mr. Moore thought that they worked actively there three or four months after the two partners went out. Afterwards, when the paper of dissolution, dated Nov. 18, 1876, was put into his hands, he said he had not remembered it was so long. Fettrow has a charge against them of blacksmith work in September, 1876.

Thus the concern existed until six or eight months after the Bell patent of March 7, 1876. That Drawbaugh had some instrument there at some time during that period, — for example, the rudimentary tin-can instrument **B**, — does not help the defendants. They must show that during that period he either had such refined and perfected instruments as would necessarily imply a long ancestry, or, if their proof goes to the tin can, it must prove its existence during the *first* part of the Axle Company's time, — and then it is not a talking isnstrument. Now, the proof from the Axle Company is perfectly fatal to them precisely in these respects. It shows that there was nothing better than the tin can **B** there during the whole of that period.

The Axle Company was a partnership of four members: Kline, the patentee of the axle; Kline's son-in-law, Capt. Moore, who had been the owner and manager of the Soldiers' Orphans' School, a school with two or three hundred pupils, situated about a mile and a half or two miles from Drawbaugh's shop; M. N. Gove, and Wilson Bear. In the beginning of 1875, Mr. Moore sold out his interest in that school and proceeded to go into that axle business, putting into it two or three thousand dollars. They fitted up Mr. Drawbaugh's shop with the additional tools and machinery specially needed for this purpose, and employed Mr. Drawbaugh to make machine tools which were necessary to the manufacture of their axles. They were people, therefore, who were friendly to Drawbaugh and appreciated him; who knew his skill as a mechanical inventor, and that he was an ingenious man, a good mechanic, and a good workman. They employed him steadily for a year or fourteen months, and paid him $440 and allowed him to do some work for himself besides. Those men ought to know all about whatever telephones there were; they must know all about them. They were there during the time when Mr. Drawbaugh says he had these machines **D** and **E**, and all these microphones. Those instruments could never have passed unnoticed. They were there when Mr. Bell burst upon the world in the summer of 1876, and became famous everywhere, and Mr. Drawbaugh of it, *yet no one of that Axle Company ever talked through a telephone, or pretended to listen at one, or was asked to talk through one, or ever saw any machine rigged up to talk.*

Capt. Moore (brief, 501; app. 204) says that at some time when he was there, Drawbaugh showed him the tin can; or rather, as he says, Drawbaugh showed him what he said was a talking machine, and said that it was to take the place of a fire alarm in cities. Then the defendants, in examining him, put the tin can **B** before him, and asked him whether he recognized that as the one that he saw; and he said that he did; that the one that he saw was like that, but he did not pretend to identify any other machine, not even the tumbler **F**. He did not see any other machine, though he says that some time while he was there he saw Drawbaugh working on some parts; that he had no conversation with him about them, nor what they were for, but he rather supposed that they related to the talking machine; and that is all he knows about it. Mr. Drawbaugh, he says, asked him if he would put some money in; if he would advance some money to help him patent the machine, and under those circumstances showed him the tin can **B**; and he says, on direct examination, that the bladder was then on it. The tin can **B** is plainly all he ever saw. Now Drawbaugh's express testimony is that when he made **C** and **I**, the tin can **B** became superseded. You cannot doubt it from the nature of the instruments, but he says specifically that

that instrument **B** had been superseded; that the tin can had gone to the garret, and that the mice had eaten off the membrane soon after, when this better instrument was made. Tin can **B** is the only instrument shown to Moore during 1875–6, and he states that *when he saw the instrument the bladder was on it.* Now, if that is a fact, his testimony absolutely displaces the other instruments. Against the defendants it is a fact. Not only does their witness Moore swear to it; not only do they fail to contradict it; but Drawbaugh, in taking Moore's deposition, put **B** before him and asked him if that was not what was shown him *and with the bladder on* (defts, i, p. 650, ans. 26–7). *That is Drawbaugh's statement* as well as Moore's.

Wilson Bear (brief, 509, app. 215) was another member of the Axle Company; he said that he had no recollection of any instrument but **A**; thinks he saw **A** before the Axle Company began; he could not recognize anything, and did not know whether he saw anything else or not, never tried to use one. Finally, he says that Mr. Drawbaugh "must have talked to him about his talking machine," because *he had talked to him about his other inventions.* That shows the state of mind of the witness. He had not the slightest recollection of anything; but he is brought to such a condition of mind that *he assumes the fact* and says, "Of course he must have talked to me about it, because he talked to me about his other inventions." He says this, although he has not the slightest recollection of the fact. Mesmerized.

Michael N. Grove (brief, 409; app. 226), another partner, was a very stupid fellow. He could not tell where he lived at a particular time, about 1874–7, and mixed up the houses he had lived in. He testified that while he was concerned with the Axle Company, and he thought in the beginning of 1875, Mr. Drawbaugh said he had a kind of box to talk to Pittsburg with. Then instrument **D** and one of the other instruments were thrust before him and was asked if they were the ones he saw; he replied that he thought they were. But on cross-examination we asked him when he had been at that shop since February, 1876, and he said he had no recollection when he was last there. That was all they could get out of him.

Jacob Kline, the other man, the inventor of the Kline axle, the man who ought to know all about it, is not called by them. His relations with the defendants are such that they would have called him if he could have helped them. It is a fact proved in the case that since this controversy began he said that he knew nothing about the telephone. Brief, pp. 266, 509.

Capt. Moore's testimony is the most important. He says that a talking machine was referred to, and he was asked if he would not aid in getting out a patent; and he was shown the tin can *with the bladder upon it:* and *that is the only instrument he saw during that time.*

The exhibition of the tin can **B**, and that alone, under such circumstances, with the fact that, according to Drawbaugh's explicit testimony, the membrane of **B** was destroyed soon after the next was made (alleged to have been in 1869), with the fact that Moore was never asked to talk through any, although he was there long after Mr. Bell became famous, are positive aggressive facts, proved by the defendants' own record. They absolutely exclude from that period all real speaking telephones, and especially such refined instruments as **D**, **E** and the small microphones and the Blake transmitter **H.**

With such proof in the defendants' own record, the Court, as matter of law, cannot find what is here needed to enable it to believe the defendants' story or make out their defence. (See this fully in brief, pp. 501-512.)

There is but one other witness so important in their record, and that is *H.C. Springer* (brief, 461, 494; app. 52), a shoemaker, who moved to Eberly's Mills, April 1, 1876, and lived there until the end of the year 1876. That was the only time he ever lived there. He says that while living there, and soon after he went there, he and Drawbaugh were continually experimenting on talking machines, and that he used to go down to Drawbaugh's shop nearly every night for the purpose of aiding in his experiments on the talking machine. He says that for the first two months while they were there (and this was at the time when the Bell patent was three months old) the only instruments they used were the tin can **B** and tumbler **F**; that is, they alone were used for three months after the date of the Bell patent. Then he says that after that Mr. Drawbaugh said to him, "Now come down; I have got a new thing that we can talk both ways through"; and then showed him **D** and **E.** Is that true or not? The defendants tried, *when he was on the stand the next day,* to get him to modify that a little, and asked him whether **D** and **E** when he saw them did not look dirty and old, and he said he thought they looked about as they do now.

The gist of that part of his statement is that **D** and **E** were then produced as novelties. But the strongest part of his deposition is that for *three months after the Bell patent, Drawbaugh used the tin can and tumbler, and nothing else.* Whether that is true or not is another question; that is what their witness says. They ask him about **A**, which they say preceded **D** and **E**, and whether he did not see it; he says that he never saw **A** and thought that it must have been made after he left. Will your Honor believe that witness or not? He is their witness. *Against them these are facts.* They insist that you shall believe him. What do they do about it? Did they examine Mr. Drawbaugh and let Mr. Drawbaugh contradict that statement? When Drawbaugh got to the witness stand afterwards, they called his attention to Springer's statement. There were two things which had got to be displaced to save their case. They had got, in the first place, to get rid of a fact that their witness had sworn to, — that **D** and **E** — the first that will really talk — were produced as novelties when the Bell patent was three months old. More than that, they had to get rid of the fact, or what was a fact as against them, that the tumbler and the tin can were the two things used for the first three months and used every night. Now, a man might forget dates, but that is a thing that he would not forget; so they asked Mr. Drawbaugh about it. I read now from page 463 of our brief, and I invite your Honor's attention to it. It is quoted from Drawbaugh's deposition (defts, ii, 903): —

"*Q.* 644. Henry C. Springer testified, on page 191 of defendants' printed record, that, about two months after April 1st, 1876, you showed him the two little magneto instruments '**D**' and '**E**,' and told him that you had improved the machine, and could talk both ways then; and that the first instruments that you showed him during the two months prior to that time would only talk one way. Were the two little magneto instruments, '**D**' and '**E**,' the first instruments that you made that would talk both ways, or not?

"*A.* No, sir; I had other instruments; instrument '**C**' was one and 'I' was another; but '**C**' was not as well adapted as a receiver as it was as a transmitter: I suppose I wanted to have him understand that those small magneto instruments could be handled more easily from the mouth to the ear."

That is the only reference to Springer that Drawbaugh makes in his whole deposition. Now, there is the fact, sworn to on direct examination by their own witness, that for three months after the Bell patent Drawbaugh used only the tumbler and tin can instruments **F** and **B**, and afterwards produced **D** and **E** as novelties. Nearly eight months after Springer had so testified, they put their man, Drawbaugh, on the stand, and did their best to turn that corner; yet all that he could say was that **D** and **E** were not the first magnetos. They did not pretend to deny the other facts (facts as against them), to wit, that **F** and **B** were the best for three months, and afterwards the first magnetos (all the better for us if they were **C** and **I**) were produced as novelties.

Suppose we ask Drawbaugh when these magnetos **D** and **E** were made. He ought to know. I will read all his testimony which professes to give any date to **D** and **E**. First I will read from the direct examination of Daniel Drawbaugh (brief, 457, defts, ii, 827): —

> "*Q.* 265. Mr. Harmon K. Drawbaugh, a witness heretofore examined for defendants, has testified, on p. 579 of defendants' printed record, that these instruments, '**D**' and '**E**,' were made in January or February, 1875, before the Axle Company received its new machinery in March, 1875; have you any recollection of the fact or not?"

Think of that! To call your own prior inventor, and, when he comes, not to ask him, "When did you make those instruments?" But, "I tell you that they were made at a date which will save this case: have you any recollection about it?" He answers: —

> "*A. I have no recollection of the time,* but I recollect of him working on the machine; one of them was made before that time; what I mean is, there was one of them made, and Harmon made, or helped to make, the other; it has been quite a long time ago; I *can't remember the year* or date of it."

But more than that. Then they went to work again to try to prove by his testimony when he first produced real telephones. They asked him (brief, 458; defts, ii, 861): —

> "*Q.* 400. Had you, or had you not, invented and made operative electric speaking telephones prior to the time of the opening of said Centennial Exposition?
> "*A.* Yes, sir; I had."

That was not a proper question. The question should have been, "What did you make?" He had already sworn that the tumbler and tin can were operative instruments. If he believed that, then answering in that sense, their existence is all that his answer means. That is the only answer in his whole deposition which *purports* to state a case against us. It purports to do so only because it assumes that which the Court has to decide. When he mentions the tumbler and tin can, and gives what he approximates as their date, he states what the instruments were, and the Court now knows that they were not an operative telephone. Then they asked him (brief, 459; defts, ii, 861): —

> "*Q.* 401. Please indicate all the electric speaking telephones that you had invented or made prior to the time when the Axle Company composed of Bear, Grove and others, commenced their operations at your shop. I mean of all the instruments in evidence and including the cup transmitter. Which ones of all these had you invented and made prior to the beginning of the Axle Company?
>
> "*A.* The teacup instrument, the tumbler instrument, Exhibit **F**, the tin can instrument **B**, instrument Exhibit **C**, instrument Exhibit **I**, and Exhibit **A**, and the magnetos, Exhibit **D** and Exhibit **E**; those are the instruments, as near as I can recollect, and I had modifications of these instruments; I won't positively say that **D** and **E** were prior to the Axle Company, but I know that at the time the Axle Company was running I had them there; it may have been prior to the starting of the Axle Company; it may be, but I don't want to be too positive; I refer to Exhibit **D** and Exhibit **E**."

That is all that Drawbaugh, the claimant, the inventor, can tell you about the dates of these instruments. Whether they were made in 1875 or 1876 will turn this case, and he does not know in what year they were made. Find it out for yourself, he says; I don't know. Does your Honor?

What help does their record give you? Capt. Moore, perhaps on the whole the most intelligent man they have, was there during the whole of 1875, and substantially all of 1876. He never saw **D** and **E** or any other microphones. They asked him what he saw. No, they did not even ask him what he saw. Drawbaugh, through his counsel, said to Capt. Moore, was not this tin can **B** the thing I showed you, and Capt. Moore says "yes." It is Drawbaugh's statement that that is all he showed to Capt. Moore, and Capt. Moore's assent to it. There is nothing in Capt.

Moore's testimony fit to turn the date to the earlier part of the Axle Company's occupation rather than the latter part; but if there were, *the fact that* **B** *is all that Drawbaugh says Capt. Moore saw*, and all that Moore thinks he saw during the whole time of his occupation, displaces the only instruments on which this case can turn.

Springer's story, if the facts be as stated by him, is fatal to the case. After that testimony from those two men had been put in, they came to Drawbaugh. "I cannot remember the year of it," he says; "I don't know the date of it." Your Honor must instruct this inventor and not he you, when he made the instrument on which this case is to turn. From whose teaching will you instruct him? Why, they have given you the testimony of such men as Simmons and May and Decker to help you. You have got to find that you know clearly and beyond any doubt something which Drawbaugh does not know, and which Springer and Moore in the strongest manner, with the most corroborating circumstances, swear is not true.

As matter of law there is no question open here to be discussed.

Well, this is not all. Drawbaugh knew when he had made those. In the spring of 1878 he could hardly have forgotten that he had those in 1876, if that were the fact. In the spring of 1878 he could hardly have forgotten when it was. In 1878, he knew whether he had those a year or eighteen months before he heard of Bell's invention, and if he had them so early there was no doubt about his antedating Bell. But in the spring of 1878 we find him stating the fact that he did not antedate Bell. Moffitt then knew that he could not antedate Bell; and Moffitt now says that he saw those things, but could not tell when he saw them at his shop. *Springer and Moore proved that those things,* **D** *and* **E**, *did not exist until after the Bell patent.*

Drawbaugh, brought up face to face with that, says, in effect, "I am ready to profit by what Decker and those fellows say; but I will not say when those were made; I will swear that I do not know in what year those were made; let the Court find out."

In 1878 he said, "I had not got anything that would talk before Bell." In 1879 he was getting a little nearer this case; he was preparing himself, one might almost think. A year earlier he *knew* he

Mr. Bell's patent. Mr. Shapley pointed it out to him in October, 1876, and gave him the paper. Drawbaugh related this on cross-examination and redirect examination; it is on p. 204 *et seq.* of the brief. Drawbaugh, in his own deposition (defts, ii, 1094), says that Mr. Shapley pointed out this article in the *Scientific American* and handed it to him, and says, "He told me that was something of the nature of the machine I was working at then." This was in October, 1876 — after Mr. Shapley had been shown the tin can but nothing else in the way of telephones. Drawbaugh says Mr. Shapley gave him the paper and "told me that" [the Reis machine] "was something of the nature of the machine I was working at then." Drawbaugh kept the paper and produced it on the witness stand, so there is no doubt about that incident.

The existence of the tin can in October, 1876, does not mean much as against us; but it is worth noticing that before that time, and on Sept. 9, 1876, the *Scientific American* had published a very poor description of Bell's telephone, *describing it as made of two tin cans.* There was nothing in the tin can, therefore, that could startle Mr. Shapley. That went on, and Shapley talked about putting money in some of Drawbaugh's things. He was a man of means; yet from the beginning to the end, Drawbaugh never so much as hinted to him that he was the inventor of the speaking telephone. Bell's invention came out and made an enormous noise in the world at that time, and he spoke of this and handed to Drawbaugh a description of the Reis telephone; and, referring to the Reis, which could not talk, which the inventor desired to make talk, but could not, he said to Drawbaugh, "That is something of the nature of the thing you are working at *now.*" Mr. Shapley said this to Drawbaugh. Those are the words as Drawbaugh reports them. Did Drawbaugh then burst out, "I have worked at this thing for years; I wanted to make it talk. I did make it talk perfectly years ago and ever since. I have my shop filled with microphones?" Not a bit. If he had all these things, the microphone, and so forth, for years, he would have said, "I have had these things for years; I will put them in my pocket tomorrow night and bring them into your store and astonish you." But not a word of that. He had showed him the tin can before; he showed it afterwards, and that is all. Mr. Shapley took note of that. He mentioned it the next year to C. A. Landis. If there had been anything more, or if Drawbaugh had said he was the originator, Shapley would have noticed that. But to this man with money to invest, the tin can alone was shown. That is all those circumstances brought forth. Here was the man who had got this perfect machine, anxious, heartbroken, because he could not get somebody to look at it, showing it to all the farm laborers who came in; but he does not show it to Mr. Shapley, or to any man of that class; does not tell him he has any such thing; does not have him talk through the machine.

Charles A. Landis (brief, 205; app. 421–423). — He is brother-in-law of Mr. Shapley, and in the next spring, that is, the spring of 1877, he went to Drawbaugh's shop, and Shapley told him to see Drawbaugh's talking machine. Drawbaugh showed him the tin can **B**. He says that when Drawbaugh showed it to him he pointed out this little piece of metal in front which is fastened by a screw passing through a slot in it, — fastened underneath the wooden block which carries the electro-magnet, while this front end, which is sharpened, is bent up so that it is opposite the centre of the tin can, where the centre of the membrane would have been. That makes a Reis transmitter. Attach to the centre of the membrane a little patch of metal; connect that by a wire with one pole of a battery; take a wire from the other pole of the battery and carry it to this little hole which you see in the tail end of the strip I have described, — I mean the little hole in the wider end which rests nearly on the base board, — and then, by means of the adjusting screw in the slot, bring the upper point of this little bent piece of metal up so that it just touches, or almost touches, the patch at the centre of the diaphragm. Whenever they touch, the circuit is closed and the current flows; whenever they part contact, the circuit is broken and the current is interrupted. Now, speak or sing into the tin tube and the air vibrations make the diaphragm vibrate to and fro, and this alternately makes and breaks the circuit and interrupts the current just as the Reis transmitter did. It is a rude and not very good contrivance of course; still it is essentially a Reis transmitter. Each time the circuit is broken you have a spark at the point of contact, and this would quickly burn out and destroy the point if made of any ordinary metal; for that reason all such contact pieces are always made of platinum, — a metal so refractory that it will stand the electric spark without injury.

Drawbaugh showed this contrivance to Landis, pointed out this little piece, *described it as a thing which would make and break the circuit*, and said that that point ought to be of platinum. Landis testified to this, and Drawbaugh does not contradict it. It is a very important statement, and if not true, why does not Drawbaugh come on the stand to contradict him? It does not quite stand alone. One of the witnesses, George Drawbaugh, a witness, indeed, of so little knowledge that we should be sorry to trust much to him, says, nevertheless, that when he saw the tin-can instrument there was a wire fastened to the middle of the bladder. When did Drawbaugh make this? Did he make it before he saw the Reis description, which Mr. Shapley showed him in October, or not? I don't know; there is no specific evidence about it, and Drawbaugh does not go on the stand to tell us, except that he did swear in direct examination, before this matter was put in evidence, that he never made a circuit-breaker instrument. It is pretty plain that they felt they had got to try to get any idea of a circuit-breaker out of this case, and pretty plain that he had got to account for this little piece of metal, *which never could have been used except to make a circuit-breaker*. He undertook to do it by asserting that it was a spring (defts, ii, 797). That is absolute nonsense. He says it was a spring to give additional elasticity to that stretched membrane. That is absurd. This man was a very good mechanic. What can you think of the idea of his taking a piece of tin, which has hardly any more elasticity than a piece of putty, and using that as a spring, not merely a piece to yield, but as a spring which should give additional elasticity to a stretched membrane? No one would do this, least of all a good mechanic like him. You might as well try to make a caldron boil by pouring in a wineglass of lukewarm water, as call that piece of soft tinned iron a spring to give additional elasticity to a stretched membrane. Whenever it was made, there is not the slightest doubt that the thing was a circuit-breaker, and was made and used as a circuit-breaker.

As a circuit-breaker it would not be necessary to have the electro-magnet on the machine. Landis does not remember seeing it, though he is not positive whether it was there or not. But if you wanted to use the circuit-breaker transmitter, you must have a receiver for it; and the tin can with the stretched membrane and electro-magnet would make a very fair receiver; and an instrument just as **B** is now with this little bent piece of tin and the electro-magnet also could be used both as a transmitter or a receiver, and if he made two of them (and one witness, David M. Ditlow, says he did have two tin cans, one at each end) he could use one at each station alternately as transmitter and receiver. That instrument he certainly had.

Mr. Charles Landis says that Drawbaugh described to him the results which he got, and said that when he pronounced a long word like "Philadelphia," he got the sound of the first syllable, but after that every syllable of the word sounded the same. That is just the description which would be given of it. It is what would happen. A man who thinks he has got a talking machine of that kind will think he recognizes the sound, but he will find that every syllable is just the same; each syllable gives, so to speak, a puff of sound, and they are all alike. That is just about the result a sanguine man would think he got from that kind of an instrument.

I spoke to your Honor yesterday, or the day before, about Mr. Bell's exhibition at the Centennial, and I read or stated something that was said about it by Prof. Henry and Sir William Thomson. After describing the instrument, Prof. Henry said in his official report (complts, i, 236): —

> "This telephone was exhibited in operation at the Centennial Exhibition, and was considered by the judges the greatest marvel hitherto achieved by the telegraph. The invention is yet in its infancy, and is susceptible of great improvements."

Sir William Thomson said soon afterwards to the British Association (complts, i, 240): —

> "Who can but admire the hardihood of invention which devised such very slight means to realize the mathematical conception that, if electricity is to convey all the delicacies of quality which distinguish articulate speech, the strength of its current must vary continuously, and as nearly as may be in simple proportion to the velocity of a particle of air engaged in constituting the sounds?"

"Who can but admire the hardihood of invention which devised such very slight means to realize this mathematical conception?" How could a man realize that mathematical conception unless he had it?

Now, we know what Drawbaugh's knowledge was. They have asked him his knowledge of vibrations; they not only asked him, but they asked Harmon Drawbaugh to tell what his uncle told him about it. All he knew in regard to vibrations was that the more frequent the vibration, the higher the pitch (defts, i, 574; ii, 793). That is the knowledge of Reis. That is the knowledge of any child who attends a singing school — the more vibrations, the higher the pitch. Drawbaugh knew that the more frequent the vibrations, the higher the pitch. That is what he knew, and that is his story. With that knowledge you cannot transmit speech; but you can fail as Reis did.

May it please your Honor, you have got to believe that this man got a speaking telephone without the knowledge necessary to acquire it, and that when he had made it, he did not use it. How do you find out whether a man has got an invention? Do you want to know whether Mr. Bell invented the speaking telephone? Ask him. Is there any doubt about his results. Ask him, and he can reply in the words of Sir Christopher Wren's epitaph, "Look around you." St. Paul's dome is not more visible than Bell's work. Ask Drawbaugh. Nobody ever learned from him how to transmit speech. Nobody ever used an instrument that he had made. He says, "I never used one myself, except for the purpose of experimenting and to gratify curiosity."

[*Intermission.*]

Mr. STORROW. — I find that I have omitted to say anything about Mr. Bell's second patent, though I meant to. It is for improvements in the apparatus to make it better accomplish the same result in the same way. I do not think it important that I should discuss it. If the Drawbaugh story be true in its whole length and breadth, it will destroy this patent. If you find it substantially untrue,—so untrue, that it cannot touch the main invention,—you will not think that you can find a little certain truth in a mountain of falsehood.

United States Circuit Court,

SOUTHERN DISTRICT OF NEW YORK.

AMERICAN BELL TELEPHONE COMPANY ET AL.

v.

THE PEOPLE'S TELEPHONE COMPANY ET AL.

ARGUMENT OF E. N. DICKERSON, Esq.,

FOR COMPLAINANTS.

BOSTON:
ALFRED MUDGE & SON, LAW PRINTERS, 24 FRANKLIN STREET.
1884.

CONTENTS OF ARGUMENT OF E. N. DICKERSON, ESQ.

The Matthews deposition and letter 1
Importance and real character of this case 5
The complainants and those whom they represent are defending property which they have acquired in just reliance on their patent 5
The defendants' claim is a mere speculative attempt to grasp the complainants' property 5
Their newspaper proclamation of this purpose 6
Plans of the defendants to forestall free inquiry and investigation by *ex parte* affidavits 7
They were enjoined, and the papers show that they had taken up this claim as a mere speculation and without competent inquiry as to its merits 8
Origin of this speculation :
Drawbaugh, Chellis, and others 9
Decision of Chellis and Moffitt in 1878 that Drawbaugh had invented a molasses faucet but not a telephone 10
Dr. Moffitt, an old friend, was sure in 1878 that Drawbaugh could not antedate Bell, and Drawbaugh assented to this 12
In 1879 the quartette — Drawbaugh, Chellis, Hill and Jacobs — decided that Drawbaugh had done nothing worth spending a hundred dollars on 14
In 1880 a party of infringers were looking for a "prior inventor" of the telephone 14
The quartette partnership was then formed ; Hill, Jacobs and Chellis got three fourths of Drawbaugh for nothing, and sold to the infringers, for $20,000 in cash and a large amount of stock, the right to try to get witnesses to swear that Drawbaugh was a prior inventor 17
They then capitalized Drawbaugh's story and his testimony at a valuation of $5,000,000 and proceeded to sell stock 17
Allegations about Drawbaugh in the answer 20

It admits that the community got all their telephones and all their knowledge of how to transmit speech from Bell, and never got anything from Drawbaugh. In the other material particulars the answer is confessedly false 22
Drawbaugh has to admit this falsehood 23
Drawbaugh had ample resources in the way of tools; misrepresentations in the defendants' brief on this subject 24
Rules of law and rules of decision:
The facts to be proved and the amount of evidence required to prove them 26
Coffin *v.* Ogden, 18 Wall. 120 26
Charges made by the defendants' brief against the complainants: they are false, and the records shows the untruthfulness of the defendants' brief and argument 29
Henry Bayler 29
Drawbaugh's autobiography 31
Henry F. Drawbaugh and his memory 39
Wilson N. Miller 41
The Ditlow brothers and Orlando Kahney 43
George Drawbaugh, Sadler's wagon and the Ditlows 45
Orlando Kahney and his desires for a bribe 49
W. H. Zearing, who heard a telephone four feet off 53
Drawbaugh a professional impostor; he copied old inventions, changing the form; and obtained money and reputation by making his unlearned neighbors believe that he originated them 54
He professes to be the inventor of a clock which would run by earth batteries without winding, and obtained among his neighbors reputation and money upon that pretence 54
The clock was thirty years old, and published in well-known books; he knew it and had the books 55
It was a thing worthless in itself 56
He had such leisure that he spent his time and money making worthless clocks and a gear-cutting engine to make them by, and a transit by which he made the neighbors believe he regulated them 58
In 1878 he got $500, upon the pretence that he, by a patent, could cover clocks to run without springs or weights, when he knew that they had been known for thirty years, and were worthless..... 59
He had so little to occupy his mind that he spent his time getting up, among other things, a winding engine to cover wire with

thread, which cost him a hundred times more than all the savings he could make by its use.................. 62
His magneto key an old thing and worthless as he made it 64, 109
The alphabet telegraph, never put to any use by him, but old........ 65
The pretence that while he had time and means to make all these things he was thinking of nothing but telephones and could raise no money for them is necessarily false.................. 66
The Faucet Company 66
They had paid him a large sum of money for his patents and fitted up a machine shop on the faith of them...................... 66
The enterprise was not successful, but he still was able to persuade them to ask him for more inventions.......................... 67
The Draper-Kissinger Ram:
The ability and willingness of Drawbaugh and the defendants to procure and to present to this Court testimony which they know to be untrue, and their skill in procuring the witnesses from that part of the country to believe and swear to what is not true, is shown strikingly by the testimony they produced about the Draper-Kissinger ram...................................... 68
They made an issue that the Draper-Kissinger ram was put in in 1876, and introduced thirty witnesses to swear to that date as of their own positive knowledge, when the contemporaneous papers and the admissions of their own witnesses on the witness stand, as well as other proof, show that they knew and that Drawbaugh of his own knowledge at the time knew that it was not put in till 1878 68
The bridge issue 83
History of Drawbaugh: facts in his history not controverted and not open to question leave no place in his life or his record for the telephone.. 85
The nail machine and his partners in it; Gov. Geary............... 85
The faucet and rotary pump.......................... 86
The Pump Company believed in him, and until 1873, were desirous to put money into any invention he might offer them 87
They considered several, but no telephone was ever offered...... 88
The Faucet Company had nine partners and eighteen workmen; not one of them ever attempted to talk through a talking machine, or, substantially, ever saw a piece of one............. 90
This is a fact in the case which negatives the telephone out of existence 91
Hauck & Co... 92

Drawbaugh too busy in working for other people to work for them, 93

The magneto key and his trials of it on a line and exhibition of it at Harrisburg....64, 92, 109

His new molasses faucet and the interference about it.... 93

In 1879 he made an issue with his fellow-workman, Hauck, as to whether he was an originator or a mere imitator or improver on other men's inventions. Hauck testified; Daniel Drawbaugh testified; Henry Drawbaugh testified; they named a large number of small contrivances he had made. His opponent asserted that he was a mere improver or maker of worthless things; *no telephone was named*.... 94

Drawbaugh admits that he cannot contradict this testimony, and his assignees do not venture to ask him to explain it.... 97

The explanations offered in the defendants' brief are ludicrous in logic and false in fact.... 97

Dr. Moffitt, his habit of disappearing.... 99

Drawbaugh's clock keeps such bad time that Moffitt will not allow it to remain in his house.... 100

Drawbaugh as a solicitor of patents.... 101

In 1879 he swears that he is, and qualifies himself as an expert by so swearing.... 101

In 1881 he swears that he never thought he was, and the defendants, by their Patent Office attorney, Benjamin, attempt to support him.... 102

In 1882 we produce his old advertisement as patent solicitor.... 102

The defendants do not dare to bring him back upon the witness stand to explain this.... 103

His advertising card contains a list of inventions which he considers important, but it does not contain a telephone.... 103

The defendants do not put Drawbaugh on the stand to attempt to explain away the force of this conclusive fact.... 105

Neither of the counsel for the defendants ventured to allude to it in their arguments; the explanations offered in their brief are inconsistent and absurd, and false in fact.... 105

E. R. Holsinger and his newspaper publications; they destroy his testimony and contradict Drawbaugh's story.... 107

The magneto key intended for a fire alarm....64, 92, 109

Drawbaugh's history continued:

The Axle Company, 1875.... 113

Captain Moore and his testimony.... 114

Moore was there from the beginning of 1875 to the fall of 1876;

his testimony is that the only telephone instrument he saw while there was the tin can; whether his particular date for it be right or wrong, this disproves the defendants' case 120

Defendants' witness, *Springer*, proves that in the summer of 1876 Drawbaugh had no better instruments than the tin can 121

Dellinger proves the same 125

Dellinger saw Drawbaugh making **D** and **E** — the first practical instruments — after 1876 125

R. E. Shapley and his testimony:

  Careless description of Bell's telephone in the *Scientific American*, Sept. 9, 1876, as made of two tin cans; Drawbaugh doubtless made his tin-can instrument from this. In October, 1876, Shapley saw it, and never saw any better instrument 129

  Shapley soon afterwards gave Drawbaugh a newspaper containing a description of the Reis telephone 131

  The next spring C. A. Landis saw at Drawbaugh's shop a Reis circuit-breaker made out of the tin can **B** and the bent piece of metal now on the instrument, which Drawbaugh explained to him as a circuit-breaker, and told him the point should be of platinum 133

The Reis circuit-breaker:

  Impossible that Drawbaugh should have spent time in making that, after he had the perfect microphones of his "high-water mark" 136

  Impossible that the strip of metal on tin can **B** should have been for a spring 136

Events of 1876–7–8–9: it is proved by the evidence that Drawbaugh's whole time, from the time he heard of Mr. Bell's invention, in the summer of 1876, to the beginning of this suit, was devoted to the telephone. Their story is that he completed substantially all the exhibits produced, and made no inventions of importance after "high-water mark" of the summer of 1876. The fact of constant occupation during this period proves that their story is false; the time must have been employed in making the microphones and magnetos, which the defendants want the Court to believe were finished before that period began 137

Drawbaugh's repeated declarations, his statements at the telephone office, and the newspaper publications show that in 1878 he was busy on telephones; no instrument is alleged which could then have so occupied him except the exhibits, which the defendants allege were completed before that time 139

His wife's complaints of his experimental work are confined to the period 1876–9 140
Baltimore American article and Mr. Matthews's interview are absolute disproof of the claim 140
Drawbaugh's autobiography of 1878–9 is positive disproof of the claim, 142
His statement to Weaver in the spring of 1878, and the sketch he made for him, prove that he was at work on telephones in 1878, and that he had not made any before Bell 144
His association with the telegraph superintendents Kiefer and Wilson, without any disclosure of telephone to them, is positive proof that none existed before Bell was famous 146
String telephones, — *Eppler*, *Eicholtz* and others 147
Uriah R. Nichols a sample of the defendants' witnesses 150
The Bell patent, its meaning and scope and the variable-resistance method set forth in it 152
Bell's position at the Centennial 153
Drawbaugh's position at the Centennial, knowing of Bell's fame 154
Drawbaugh's **H** is an ignorant copy of the Blake transmitter 155
Drawbaugh presents microphones, and does not know when or how he came to make them 156
Drawbaugh antedates Columbus 158
  And discovers all things which had been known before his time 159
Mr. Edmunds's argument:
  It is chiefly based on two asserted facts: that the neighbors thought a telephone was worth nothing, and that Mr. Orton waited a year and a half after seeing it before thinking it worth touching ....
  Mr. Edmunds does not know the record; the facts are exactly the other way 160
  That Mr. Edmunds can be so mistaken is the best proof of the worthlessness of mere memory 161
Conduct is the only proof to be relied upon 162
Mr. Edmunds says that the instruments look old; take them apart and it appears that they were made of old materials 163

United States Circuit Court,

SOUTHERN DISTRICT OF NEW YORK.

IN EQUITY.

AMERICAN BELL TELEPHONE COMPANY ET AL.
v.
PEOPLE'S TELEPHONE COMPANY ET AL.

BEFORE HON. WILLIAM J. WALLACE, *Circuit Judge.*

ARGUMENT OF E. N. DICKERSON, ESQ.

NEW YORK, Sept. 30, 1884.

Before Mr. Dickerson began, Mr. STORROW said, —

Mr. STORROW. — At the close yesterday, the defendants asked about a letter of Mr. Matthews, which I now propose to read.

Mr. Matthews originally made an affidavit in this case for the motion for a preliminary injunction. His visit to Drawbaugh's shop and his article in the *Baltimore American* were in 1878. This affidavit was made in October, 1880. It was drawn by Mr. Matthews himself, at home, alone. He had himself practised law for some years. He preferred to draw it himself, in order that he might be sure that it stated his own recollection and used his own expressions. That is the way it was drawn. It was then copied by a notary and signed and sworn to by him. That was, therefore, within less than two years after he wrote the article.

In the summer of 1882 he gave his deposition at Baltimore. On that deposition I put into his hands the article and asked him if he wrote it. It had already been placed in Drawbaugh's hands on his cross-examination. I asked Mr. Matthews whether the statements in that article were according to his recollection at the time he wrote it, and whether they were still according to his recollection; and I then asked him to state what instruments he saw at Drawbaugh's shop. I particularly asked him whether he saw the tall instrument H, with the bell on it, and he said he had not.

He was then cross-examined at considerable length as to the details of that interview.

In December, 1883, eighteen months or seventeen months after that, I received a letter from him, which I will read presently. I was in Harrisburg at the time. The letter had been sent to Boston and forwarded to me at Harrisburg, and I immediately went to Baltimore to see Mr. Matthews, as he had asked me to do in the letter. I went to the newspaper office, where I had been before, and where his letter was dated, and they told me that in the preceding summer he had left the office, having been overcome by the heat or sunstroke, and had not done any work since, and was in an uneasy frame of mind, and it was doubtful when he would do any more work.

I went immediately to Mr. Matthews's house and saw him, and it became evident to me (I do not mean to say that he was out of his mind, or anything of that kind, for he was not at all) that he was in an unnatural and morbid condition of mind. I had some conversation with him, which I will state to the Court if desired, but not otherwise. It did not differ materially from the letter.

He spoke to me of a legal gentleman, an old and intimate friend of his, a well-known gentleman of high standing, and whom he had talked with. I went to that gentleman's house, introduced myself to him, and told him my relations to the case and my interview with Mr. Matthews. He said he had seen Mr. Matthews, and he agreed that his condition of mind was just what it appeared to me, and that he was in a condition of mind where he was unduly disturbed about trifles. The matter referred to in his letter was the merest trifle.

The letter, which I have in my hand, is as follows:—

BALTO, Dec. 1, 1883.

Office of BALTIMORE AMERICAN,
Cor. South and Baltimore Sts.,
BALTIMORE, MD.

(PRIVATE AND CONFIDENTIAL.)

MR. J. STORROW:

Dear Sir, — What is the status of the case of the Bell Tel. Co. against The People's Tel. Co.? In what Court is it pending, or has a final decree been reached? I have recently become impressed with the conviction that there are several wrong statements in my deposition taken before Commissioner Ott, which may affect the decision of the case, although a legal friend tells me that my whole testimony is immaterial, and would scarcely be considered by the Court at all. I believe it is not the policy of the law to allow a witness to correct his testimony merely for the purpose of relieving his conscience; but where the matter is material, and affects great interests, I think that, if application is made before the taking of testimony is closed, the Court will allow a new deposition to be taken, and, even if a decree has been reached, an affidavit disclosing a great mistake in the testimony, will form ground for a new trial. Of course the witness puts himself in peril if he has sworn falsely to a material fact. It is still my firm conviction that Drawbaugh had no telephone in operation when I visited his shop, and that he did not show me any such instrument as was exhibited to me when my deposition was taken, marked H. I am also clear in my recollection that he did not set up any claim to be the original inventor of the telephone. In the paragraph devoted to the telephone in the article published in the *American*, I think I gave him credit for all and possibly more than he claimed. I ought to have said however in my affidavit, and in my subsequent examination, that at the time of the interview I had probably never seen a working telephone, and knew little or nothing about its mode of operation. The impressions in the newspaper paragraph referred to may have been colored, modified or changed by conversations with other people on the subject after the interview and before the article was written. This, however, is not the matter that troubles most. In my affidavit I mentioned two wooden hemispheres shown me by Mr. Drawbaugh as parts of a telephone with which he had been experimenting. After mature reflection, I cannot remember that Mr. Drawbaugh said anything about these hemispheres. They came under my notice while Mr. Drawbaugh was showing me something, and while the telephone was under consideration, and I connected them in my own mind with the telephone, but I cannot say that Mr. Drawbaugh touched them or said anything about them. My present recollection is that he did not, although, in the cross-examination, when my deposition was taken, I placed these pieces in his hands. I have had no communication with Mr. Drawbaugh or with any one connected with the case, and I have no more information now than I had when the testimony was taken; but I am constrained to think that the portion of my testimony which makes him exhibit to me these pieces as parts of the telephone ought to be excluded. My recollection of the whole transaction is so vague that I never ought to have ventured to say anything about it; and the portions of my testimony relating to the matter certainly ought not to be considered by the Court when making up its decision, although it may be in accord with other testimony of a more positive character. My recollection of the conversation about Bell and Edison is also very vague, but my testimony is probably substantially true as to what was said. It would be better, however, if the whole could be excluded. I am in some distress of mind about this matter, and should be glad to hear from you without delay. I had no possible motive to testify falsely, and I have no motive in seeking to make the correction, except to put myself upon a solid basis of truth. If the interests of any of the parties are likely to be injuriously affected by the testimony to which I have referred, then I think it ought to be corrected at every sacrifice. My address is 303 Hollins St, Balto, Md.

Respectfully,
JAMES P. MATTHEWS.

Mr. Storrow. — It appeared to me, as I presume it appears to every one, that the thing which Mr. Matthews was called to prove, to wit, that he published that article containing those statements about the origin of the telephone, and that what he had there stated was true, was abundantly confirmed by the letter, and that the question whether the thing actually shown were a telephone or not, and which his conscience had taken hold of, was a matter entirely immaterial and had nothing to do with the case. Here is the letter, your Honor (handing the letter up to the Court).

The Court. — This letter is not a part of the case, of course. It is certainly a very creditable letter to the witness, who was anxious not to have a statement presented which should in any respect have deflected from the true facts as he had them.

Mr. Hill. — All I desire to say is this: that there is no question but that the gentleman is in his right mind now.

The Court. — The letter shows clearly enough that he was in his right mind at the time he wrote it.

The Court to Mr. Hill. — Have you any objection to this letter being made a part of the record?

Mr. Hill. — No, sir.

The Court. — It will go into the record.

ARGUMENT OF E. N. DICKERSON, ESQ.

Mr. DICKERSON. — May it please your Honor, the cause which has been committed to my care by Mr. Bell is the most important ever heard in this or any other court in the United States, involving merely private interests. It is the most important in respect to the magnitude of the case itself; the number of persons who have testified; the apparent conflict of testimony between the two opposing sides; and it is the most important in respect to a great reputation which stands in some sense depending upon it; and in respect to the pecuniary consequences which are involved in its decision.

Nominally, it is a case between a corporation in Boston and a corporation in New York seeking the privilege of making and putting upon the market the telephone. Actually, it is a controversy between one hundred thousand people on the one side, attempting to defend their rights against encroachment and piracy in which one hundred millions of dollars are involved. There is no village in the United States having a population of 5,000 and upwards, in which there is not established a telephone plant, put there by the capital of the people around it, invested upon the confidence which the community has had, and has had a right to have, in the stability of this patent and in the title under which they hold their licenses. From the shores of the Pacific to the Penobscot, and from the Mexican Sea to the St. Lawrence, there are to-day thousands and tens of thousands of people, with their eyes anxiously fixed upon this court room to ascertain whether this decision shall ruin them, or whether they shall hereafter stand as they have heretofore stood, — under the protection of the law.

On the other side, this claim that is made is a mere speculation. t is a speculative claim, got up for the purpose of assailing this cumulated and vested property, and, if possible, sharing it or grasping it. That such is its purpose appears in our bill of complaint, and in the advertisement under which it was launched. I read an extract or two from that bill and that advertisement (complts, i, 13): —

"An application for a patent was filed to-day, that, in consequence of its *vastness of interest* as well as *wealth of prospect, renders it a subject of national interest.*"

That is strictly true, may it please your Honor; it is a subject of "national interest."

The application for the patent made in 1880, in the month of July, four years and some months after the Bell patent was granted, is a *pending application*, and it has been backed up by numbers of other applications from the same source, which the record discloses, and which are also pending applications. My learned friend yesterday told your Honor that this was only a *little* question whether his venerable friend Drawbaugh, and his innocent coadjutors, were to be allowed to practise his own invention in peace or not. It had shrunk, in his eyes, from being a question of great "*national interest*" into a petty question whether his innocent clients should be entitled to use the invention which Mr. Drawbaugh had made.

"The *cash* capital of the company" [which filed this application] "is five millions of dollars, with headquarters in New York, and in about sixty days they will open up the telephone, which will certainly result in the *driving out of all telephones in the market*, save the ones they hold, or else compelling the Gray, Bell and Edison lines *to pay the new company a munificent royalty.*"

The wealth of Eldorado is there. The owners, under Bell, must be crushed out or pay a *munificent* royalty. Such must be the result if the expected patents upon Drawbaugh's invention can be granted to them; and here and now is the first issue made, whether they can or not. The advertisement goes on: —

"A *large number of capitalists* were here to-day to see the filing of the application, and they assert, with a positiveness that is almost convincing, that it will not be long *till they have entire charge of the telephones* not only in this country but in the world, and that they will be able to establish lines by which messages can be transmitted for *almost a song.*"

The song of the siren! That, may it please your Honor, was the programme on which this body of "*capitalists*," with five millions of dollars in "*cash*," proposed to raid this property. That body of *capitalists* has been in this court ever since. It is here now. I see it.

One difficulty stood in their way, and that difficulty was this court. Immediately after this advertisement became public, which was the first time that it had been heard in the world, — I don't say the first time that it had been heard in the little circle of a half dozen people who assembled around Drawbaugh in Harrisburg, but the first time that it had been heard in the world that Daniel Drawbaugh was the inventor of the Bell telephone, — this Bell Telephone Company, standing, as it does, the grantor to and the trustee for all these numerous companies spread over the United States, set itself to investigate this claim and ascertain what foundations it had. Fortunately for that company, it had for its counsel my friend Mr. Storrow, upon whom I pronounce no encomium. His monument stands before you; and it will remain an imperishable record to his honor and his glory. He went to that country at once, and what did he find? These "*capitalists*," so called, had been spreading themselves all over that community, had inveigled into their net all these farm laborers, loafers, and people in similar condition of life, who surrounded Drawbaugh, and were his friends and intimates, and had got from them all, or at least from as many as they could, affidavits committing themselves to this claim which was about to be made. It was a terrible task to undertake to unravel the meshes of that complicated web. Talk about detectives, whose names have become famous in the annals of modern civilization by the skill with which they have seized upon clews and unravelled the nets of iniquity! Why, the records of this case are more interesting than Gaboriau ever wrote. Mr. Storrow, who stood there on the outside of that well-knitted, *fraudulent combination*, and looked into it, found himself barred upon every hand by the outposts, the sentinels, the guards that had been cast about it by these ingenious "capitalists," with their five millions of capital *in expectancy*, and he had to go to work in the most circumspect manner. He knew not to whom he might speak; he knew that whatever he did or said would be carried at once into the enemy's camp, and that he would be dogged and followed. It was an Herculean task that he had to undertake. He has done it well, and I trust he has done it successfully; he has earned the undying hatred of the "capitalists." At once he found out certain things, — certain facts, — facts which stand to-day as facts, and which have not been attempted to be shaken or affected; facts that rest not in the uncertain memory of man, that depend not upon the influences that can be cast about witnesses, either to affect their integrity or their memory; but monumental facts on record, — printed and written and sworn to. He brought these facts together and put them into his bill in equity, and moved for an injunction against this body of "capitalists," who were about to take possession of one hundred millions of property, from the Atlantic to the Pacific, throughout the whole United States, and he moved for an injunction in this court.

What happened, may it please your Honor? The defendants were challenged to come up to this bar and tell their story. This body of "capitalists", about to seize this property (sixty days was all the time they wanted to take it in, if I read their advertisement aright) were called to come up to this bar and show cause why they should be permitted to do it. And what did they do? They had a trunkful of affidavits, which they had been collecting for some months; they had this immaculate person, Drawbaugh, alongside of them here with his affidavit, — which, I will mention in passing, we have been trying very hard to get possession of ever since and with eminent failure. We have called for it on the record, and it has been refused to us. We wanted to know what the story was when it was thus first concocted; we wanted to know how far Daniel Drawbaugh had put himself on paper when he came to this bar in 1880; we have called for that affidavit on the record, and his distinguished partner said, "It is in Washington. I don't know that it is any of your business to have it. You can't have it; it is all right" (defts, ii, 1060–1). We have not been able to get that affidavit. But they stood before this court and said — what? They swore that they were not going to make telephones, they didn't mean to make telephones: there it is, in their affidavits filed, — they didn't mean to make telephones. (See moving papers, affidavit of defendants' witness, Lewis Abraham.) Why should the Court lay its hands upon them? They were now engaged in taking the opinion of counsel whether they had a case. That is what they swore to.

Mr. Hill. — Just read that affidavit.

Mr. Dickerson. — I will read what I please.

Mr. Hill. — I prefer to have it read.

Mr. Dickerson. — Well, you will hear enough read to-day to last you your natural life.

Now, may it please your Honor, I stand before you making statements which *may* not be true, but which I know your Honor will believe to be true until you look at them and find them to be false. They never said that they had a defence to make that day, but they begged the Court not to enjoin them, because they did not mean to make telephones, and they said they were taking the opinion of counsel, which they had been some time taking, as to their defence. Your Honor was not in this court when Judge Blatchford was sitting on that bench; but anybody who knows Judge Blatchford will remember him. When he draws down those spectacles of his and looks across the top of them at a man, as he did that day, that man might as well be struck with lightning. "Well," said he, "if you are not going to make telephones, it won't do you any harm to be enjoined; and I think I will enjoin you." And they went out of this presence with their sixty days' scheme nipped in the bud. That was four years ago; and during that time this company of "capitalists" has been engaged in finding out, what they didn't know in 1880, whether they have a defence. They don't know it now; but they didn't know it then, *and swore so*, — that they were taking the opinion of counsel as to their defence.

Well, sir, let us see how this company of capitalists came into business. Daniel Drawbaugh was a genius, of local renown; he lived at Eberly's Mills. I wish to fix your Honor's attention now, for a little, upon the topography and geography of that place. There is a map of it here, which I will not ask you to look at now; but I tell you that Dan Drawbaugh's shop is as near to the city of Harrisburg as this court room is to my house in Thirty-fourth Street; it is "within sound of Bow bells"; it is within three miles of the city of Harrisburg. It is a suburban village, which has in it *twenty houses and seventy-five people*, — its population all told, — "within sound of Bow bells," within three miles of the city of Harrisburg, which was their base of supplies. In the course of his varied career, Drawbaugh, this eminent "*old gentleman*," as my friend, Mr. Edmunds, called him, — and I protest against the "venerable" in that expression, because I feel it to be a certain sort of personal reflection upon myself, for he is some years younger than I am, and he was forty years old when he achieved these great results, — this eminent "old gentleman" had been occupied there for some years in astonishing the natives around him by various feats of legerdemain and trickery, which I will come to presently. There was in the town of Harrisburg a "gentleman" by the name of Chellis, who keeps a ninety-nine-cent store there, and whose advertisements, among other things, are in this record, — for which he probably has never paid Mr. Storrow anything, although it has given him a degree of publicity which he had not heretofore achieved, — where you can buy a set of gold jewelry for ninety-nine cents, or anything that man, woman, or child wants, from the cradle to the grave, for that exact price. This Mr. Chellis, living a neighbor, within gunshot of Mr. Drawbaugh, and having a friend by the name of Dr. Moffitt, a dentist in Harrisburg, a rather eccentric character, who, like the Ravels, used suddenly to disappear from the scene of action, and not be seen for some months again —

Mr. Hill. — Oh, no!

Mr. Dickerson. — Yes, it is on the record. You know about it.

Mr. Hill. — I don't know anything about it.

Mr. Dickerson. — Don't pile up any more sins upon your soul. Before I get through I will show you enough. Now, your Honor, this Mr. Chellis and this Dr. Moffitt and Mr. Drawbaugh formed a partnership in 1880 for the purpose of going into a Patent Office fight, and getting a patent for a certain molasses spigot, which was an improvement made by Drawbaugh upon a certain other molasses spigot, which was an improvement upon a long line of ancestors in that way for a century. Two improvements on this valuable device had been made by Daniel Drawbaugh, the first one having resulted in an enormous pecuniary loss to his innocent friends; and in 1878 he had got another improvement, upon which he formed a partnership with this Mr. Ninety-nine-cent Chellis and this Dr. Moffitt to manufacture the spigots. Chronology here is very important, and I am going to try to keep it before your Honor's mind in the various presentations that I shall make to you.

At that time, in 1878, Bell's patent being then two and a half years old, — this was in the fall of 1878, — Drawbaugh had been at work, as hundreds of others had, at experiments on telephones. He began those experiments in the fall of 1876, — but I am not going to discuss that question now, I am merely stating that theory for the purpose of illustrating what I am now speaking of, — he began those experiments in the fall of 1876, and in 1877 and 1878 he was occupied in prosecuting those experiments with a view of making the telephone talk louder. The local newspapers about that time were reporting that Mr. Drawbaugh was engaged on inventing a "*new kind of telephone*," which would be an "*improvement upon the mother invention*" (complts, iv, exhibits, 388, 398). He was then engaged in trying to improve the "mother invention," and these two gentlemen, Mr. Chellis and Dr. Moffitt, came into partnership with him to apply for a patent and manufacture his improved molasses spigots. The testimony of Dr. Moffitt *now* is, that for many years — away back before 1870 — he had been very familiar with Drawbaugh; had been in his shop a great deal, attracted there by his inventions and the glory thereof, and that in the year 1873, five years before this partnership was formed, he had heard Drawbaugh's receiver, lettered "A," speak so loud to him, — Drawbaugh being at the time in the cellar, talking to a transmitter, — that he turned around, supposing Drawbaugh to be at his elbow, and was surprised that he was not. He has so testified as to that year, — and he is one of their strong witnesses to prove Drawbaugh's invention. This Dr. Moffitt was one of this molasses-spigot partnership. At that time when the partnership was formed, Drawbaugh, according to their present testimony, if it be true, had in that room — where these partners were, where their business was carried on — a row of telephones *culminating in the Blake transmitter lettered* H, *which had been finished two years and some months earlier than that*, and which, so far as we know, were never outside of the four walls of that building where these partners were. Drawbaugh, however, *was experimenting at that time upon telephones*. The ninety-nine-cent man was prosperous. He had turned his dross into gold, and was going in now for some speculation in patents, and Drawbaugh said to these people, in substance, "Come in with me now, and help me upon my telephone inventions." I am telling your Honor their story as they swear to it. Dr. Moffit was one of the partnership. He knew, of his own knowledge, if his testimony now be true, that Drawbaugh had a telephone which startled him from his propriety *five years before that, in that same room, in that same building* (defts, i, 517). He also knew at that time, — 1878–79, — as all the world knew, that the telephone was spreading itself over the land, bringing in its train fame and fortune to its inventor and its owners. "Come with me," said Drawbaugh, "and help me with my telephone." And what did they say? "Why, Drawbaugh, you can't anticipate Bell, and what is the use of your spending your time upon these things? You can't anticipate Bell." Well, there was one man in that trio who knew whether he could or not, and that man was Moffitt. There was another man who knew whether he could or not, and that man was Dan Drawbaugh. The ninety-nine-cent store man knew nothing about it. But those two men knew; and what happened? Drawbaugh's answer to them was, "I DON'T KNOW ABOUT THAT; I HAVE BEEN WORKING AT IT A GOOD WHILE." I am quoting *Drawbaugh's very language*, that Chellis himself puts on this record (brief, p. 232) in quotations: "I don't know about that; I have been working at it a good while." Well, if he didn't *know* whether he could anticipate Bell, there was a man alongside of him who *now says* he did; and that man was Dr. Moffitt; but, upon consultation, the conclusion was that they wouldn't trouble themselves with Dan's pretensions, but would go into a Patent Office fight, and get a patent, if possible, for his improved *molasses spigot*, whose business it is to measure out molasses from barrels in cold weather, when it don't run freely. And they formed a partnership, of which the *two foundation stones* still remain in the further developed partnership which has resulted in bringing this great case into this court. Those two foundation stones were Chellis and Dan Drawbaugh; and they went into a Patent Office fight about a molasses spigot.

A man named Hauck, who had been Dan Drawbaugh's associate in that very room where these supposed telephones existed, working with him for years at the same bench, claimed also to be the inventor of that molasses spigot. *It was an important question.* This great inventor, Drawbaugh, who at that time had become famous as the inventor of the "*justly celebrated electric clock*," — that great inventor, with his backers, went into a litigation in the Patent Office about a molasses spigot. If it had not been for that litigation we never should have had the pleasure of seeing the third partner in the business, Hill. He was employed by Chellis and Dan as counsel in the molasses-spigot business, and that brought him into this case. They carried on that molasses-spigot case through the winter of 1878 and 1879, and they carried it on at great cost, with eminent skill and success; for they beat David Hauck in the Patent Office, and got that molasses-spigot patent, and they have it yet. It cost a great deal of money and a great deal of time; and I trust for their sakes that it will prove more remunerative than the ancestry from which it descended. They got that patent for the molasses spigot, and by that time another year had rolled on, and the fall of 1879 came. All the while the telephone was spreading itself over the land, and a great litigation was going on between the Western Union Telegraph Company and Mr. Bell. Part of the testimony in that litigation is in the record before your Honor now, and your Honor has been told by the other side about that litigation in the argument here.

The Western Union Telegraph Company has a disagreeable habit of finding out whether a man is the true inventor of a thing that he claims, by just taking it and using it, and letting him prove his claim in court. They never know it so well as after that, because the chances may be that he is not the inventor. Like some men who never will pay their debts until a judgment is got against them and is satisfied on record; otherwise they cannot be sure that their debts have been paid. The Western Union Telegraph Company, wishing to know whether Bell was the inventor, had taken possession of the Bell telephone and had spread it over the country. That Phelps "crown telephone," that has been shown to your Honor, and that elliptical instrument called the "snuff-box" instrument, — those were the Western Union Company's instruments, — infringements of the Bell patent. This great litigation was going on in 1879 between the Western Union Company and the Bell Company, which was struggling at that time to maintain its foothold against its formidable assailant. It did look then as if there was a very good chance for *somebody* who could help the Western Union Company to a defence to get into that fight and make something. The Western Union Company were setting up Elisha Gray as the first inventor of the telephone. The microphone, in the form of the carbon transmitter, had emerged in a manner which I shall state to you presently, and was now a controlling element in the case; because, when the wire line of a telephone is laid across the country, where it comes near lines of telegraphs, the inductive action of the telegraph currents upon the telephone wire generates sounds in the telephone. Every one of us has heard them snapping and snarling in the telephone receiver, and the *feeble magneto current* is drowned out. It is, therefore, necessary to get a strong battery current of electricity flowing on the line, upon which a throttle valve, — so to speak, — to turn it off and on, may be applied, and may be regulated by the voice, and so get the benefit of a strong battery current, which is not so easily drowned out by interfering induction. Therefore the carbon transmitters had become very important; and numbers of inventors had been at work at them in the manner that I will mention presently. Berliner was one, Edison was one, and a number of others claiming to be inventors and improvers of that thing. The Western Union Company bought up, as they had a right to do, the inchoate rights of as many inventors of these useful collateral things, microphones and the like, as possible, as a shield against the Bell attack; for, if Bell should prevail with his broad patent which *covered* the magneto as well as the microphone, yet, if they had a patent upon the special microphone devices, especially for the use of the "*hard carbon*," which is a great thing, — if they had a patent upon *that*, of course they could prevent the Bell people from using it, and they would have a very good weapon in their hands to fight with. That fight was going on during the years 1878 and 1879. And it was going on in 1879 when Chellis, in Harrisburg, concluded that he would like to have another show at the question whether something could not be done with Drawbaugh's telephone improvements he was then working on. Thereupon he sent to Washington for Hill, who had been his counsel in the molasses-spigot case.

Hill came to Harrisburg for consultation in 1879 over the question whether Drawbaugh had *anything* that was *worth patenting*, and they had a consultation, when Mr. Hill advised Chellis — this is the story as Chellis tells it — that no doubt Drawbaugh was the first inventor of everything that had ever been done, but it was not worth his while to go into it, because here was the Bell Company, and Chellis would have to spend one hundred thousand dollars to beat the Bell Company before he could establish Drawbaugh's title. May it please you Honor, that day and hour that Exhibit **H**, — the Blake transmitter, — if it had existed in 1876, was worth a million dollars cash, as soon as a check could be drawn for it, — and no man knew it better than Lysander Hill. **H**, *the Blake transmitter, then three years old*, in that very room, was worth a million dollars cash as soon as pen could be put to paper, — if the story were true. Why? Here was a great fight against the Western Union Company, which was defending itself against the Bell Company, and the Blake transmitter controlled the profitable use of the Bell patent.

There were also at that consultation on the same table **D** and **E**, those magneto telephones *made, as they say, in 1875*, never taken out of that shop. And this great question was raging, and Hill, as a patent agent, had come right from Washington, where the fight was raging in the Patent Office, — it was raging also in the public press, — who was the inventor of the microphone or the carbon transmitter? Berliner was claiming it, Edison was claiming it, Hughes was claiming it in England. It was a controversy on which depended not only fortune but fame. That fight was going on then and there when Mr. Hill sat down with Chellis and Drawbaugh, and — *according to their testimony now* — Drawbaugh must have said to them: "Here is the Blake transmitter, now in general use, but which "has come into use within a few months. Here is the Blake transmitter. Don't you see it, gentlemen? Why, it is not only the "Blake transmitter as it is in use in Harrisburg, but the castings, the "screws, the springs, the details, are exactly like those that you can "see right here in Harrisburg, if you look at them, — you can almost "take one set of patterns and make the other instrument, — and *I "made that, with my prophetic soul, two and a half years before it "came out in the world*. Don't you think that is worth a thirty-five-"dollar patent fee?" Hill says, "No, I think not; thirty-five dollars "is a great deal of money." "But," says Drawbaugh, "here are "**D** and **E**, the magnetos: don't you see that they are exactly "like these butter-stamp things" (those black instruments that we have in our hands now)? "Don't you see that they are exactly like these "in every respect? Here! I show you Bell's patent, taken for them "in 1877." Mr. Hill saw fit to tell your Honor — and he is a good witness — that Drawbaugh had the 1877 patent, and probably the 1876 patent; but he had the 1877 patent. "Don't you see, here are **D** and **E**, exactly like Bell's 1877 patent, and I made them in 1875, as my nephew, Harmon, knows?" "Oh! I see that," says Hill, "it is very plain; but, Mr. Chellis, I advise you not to risk thirty-five dollars in applying for a patent for that. It is a great deal of money, and you had better not." "Don't you see this string of instruments," says Drawbaugh, "that I have had for ten years, talking to the whole country-side here? I will call our partner Moffitt. He heard that **A** talk so loud that it astonished him and took him off his feet five years ago. Don't you see that?" "Oh! you better not," says Hill, "risk any money on that. Thirty-five dollars is a great deal of money." And Mr. Hill went back to his Patent Office in Washington, and this partnership of *two* remained up there and decided to do nothing. That was in the late summer or fall of 1879. (See the references in brief, pp. 228–235.)

The Western Union Company was defeated after the world had been scoured for information, with all the resources of that mighty corporation, and all the ability that they were able to command. My lamented friend, George Gifford, was their chief counsel, and Mr. Causten Browne, of Boston, another. They surrendered. They had exhausted their defences against the Bell patent, WHILE HERE WAS DRAWBAUGH, HANGING AROUND THEIR TELEPHONE OFFICE IN HARRISBURG AND BORROWING THEIR INSTRUMENTS, WHO COULD HAVE PUT BELL OUT OF COURT IN A MINUTE, BUT WOULD NOT OPEN HIS MOUTH. But they had something left; they owned the Page patent for the Ruhmkorff coil, recently sustained by Judge Blatchford, and which is of great value in the Blake transmitter; it is not *actually necessary*, but it is *practically* necessary in telephones; and they owned it. Edison claimed to be the first inventor of the *hard-carbon* transmitter, and they owned his claim, and that was essential to the developed telephone. They had that to trade on. There was a dispute whether he or another who had sold to Bell was the first man, and it was a fair question, and might be decided for Edison. These were the things the Western Union had to compromise with when they surrendered.

Then an infringement was commenced by a party in New York, and they were looking about for defences. One of the party, however, lived in Washington, where Mr. Hill lived. They were looking about for a defence. Now this was in 1880, four years after the Bell patent, and half a generation after the invention by the *venerable* Drawbaugh, who evokes the admiration of my friend from Vermont. They were looking about for a defence; and they got knowledge, somehow, that there was a man up in Harrisburg who would sell them a defence if they would buy it. In this situation a partnership of *four* was formed. That partnership was what I would call the *quartette* in this case,— Hill, Jacobs, a little attorney up in Harrisburg, the ninety-nine-cent Chellis, and Drawbaugh. They formed a partnership of four. That is the quartette, may it please your Honor, that has been making music for this country for the last four years. They formed that partnership. Then these New York infringers were sent up to consider whether they would not buy Drawbaugh's defence, — not as a means of making any telephones, but as a defence. Somebody advised them (I don't know who it was, — I was not with Mr. Hill every day during that time), — but somebody advised them it would be a good thing to do, and they sent a layman up to Harrisburg to investigate Drawbaugh's case. He saw Drawbaugh, saw his affidavits, and saw M. Jacobs. Mr. Hill was not there, but the other three partners were; and it resulted in this, that the New York company of infringers — having been advised, as they say, by counsel, that they were infringers — agreed to pay $20,000 in cash for Drawbaugh's defence; which $20,000 in cash was divided immediately afterwards into four equal parts among the four partners,— Hill, Jacobs, Drawbaugh and the ninety-nine-cent man. Now that was a magnificent "*strike.*" So far that parnership was eminently successful. To raise $20,000 in cash out of Chatham Street, you know, is a thing not to be done every day. But they did it. They got their $20,000 in cash, and more. They got and divided among themselves in equal parts an amount of that five millions of capital stock, "cash"—"cash" capital stock that we have heard of — they got and divided among themselves an amount so great that when we called upon them on the stand to tell us how much it was, they refused. We were entitled to know, may it please your Honor, because Dan Drawbaugh was their witness, and his interest in the result of the controversy we were entitled to know, and we said, "Mr. Drawbaugh, how much did you and your partner divide of that capital stock?" "Under the advice of my counsel, I decline to tell." We could have come here and got an order on him to tell, but it would have wasted time, and we consented to accept an admission upon the record that the divide was "*considerable.*" What "considerable" means, we do not know. But, no doubt it was an immense portion of this five millions "*cash*" capital that was divided among this partnership. That was a good operation. The partners began on velvet; they had $20,000 in their pockets, in equal parts, and "*considerable*" of these five millions to go into market and sell to an unsuspecting and innocent community. They began business upon that basis. That is the partnership. (See complts' brief, p. 234.) One of its members is here, and has tried the case for himself and his associates. He and the rest of them have been ever since 1880 engaged in the business of making up their case. That is this case. It stands, to begin with, in the discredit that belongs to all speculative cases, got up for the purpose of attacking vested rights and raiding upon accumulated property. It comes here contaminated with that iniquity; and, if their story be true, contaminated with an original fraud, — for they cheated Dan Drawbaugh out of the greater part of the $20,000, because they put nothing in and they took $15,000 out: he put in the *entire capital — his story*.

That is this fight. These are the two sides to this controversy; and between them your Honor has got to decide. And even this speculative case, may it please your Honor, had been passed upon by the partners twice before, — before they brought it here, when they were five years, and six years, nearer to the facts than they are now, and when they decided for themselves *that it was not worth thirty-five dollars*. For your Honor now knows, and of course you know it, because it has been sworn to by a witness who has not been impeached, — your Honor now knows that Drawbaugh's distress for all those years was to get money enough to apply for a patent. That was all his trouble; he had no other difficulty. An application for a patent, as your Honor knows, costs $15, — I am going to be very exact in money now, because this is getting to be a money question, — an application costs $15, for which the Patent Office will examine the case and pronounce its judgment whether the applicant is or is not entitled to a patent. It costs just $15 to do that. If the Office decides in his favor, and if he wants his patent out, it will cost him $20 more. It costs him $35 in all when he has got it. It costs $15 to feel the pulse, to know whether the claims are going to be granted or not. The common charge of a patent agent is $20. Mr. Weaver, a highly respectable patent agent, and a great friend of Drawbaugh, who had been employed by Drawbaugh in other cases, or by Drawbaugh's associates, charged $20; and Drawbaugh, himself a patent agent, regularly charged $20 as his price. It was the going price; no more, no less. Drawbaugh adopted that price in his patent business; and so with every other patent agent. Fifty-five dollars was what it would have cost in those years, supposing Drawbaugh to be a man of extreme modesty, not wishing to appear in his own case. Now, sir, the partners decided in 1878, and again in 1879, that Drawbaugh's case was not worth $55; but when they got somebody they could strike for $20,000, then it was worth $20,000, and, in addition, it was worth a big proportion of $5,000,000 of stock, on which they started business. They have done immense mischief; but I don't think they are any nearer to their Eldorado than when they launched their bark upon the ocean. I don't think they are. But they have been sailing in that direction ever since; and they have struck an Eldorado on the *stock market with their chromos.*

It is a remarkable fact, may it please your Honor, — a remarkable coincidence, — that the headquarters of this concern — not for making a telephone, your Honor: they are under an injunction, Judge Blatchford put his foot on that business, — not for making telephones, or for selling them, but for the making and selling capital stock chromos, at a price reduced to the humblest capacity, — fifty dollars a share, so that every woman and child can buy one, — the factory for that is in what is called the "United Bank Building," the place where Ward victimized an historic man with an historic name, and where he drew in his victims, with his "inventions."

Mr. Hill. — The office of the senior counsel of the Bell Telephone Company is in that building.

Mr. Dickerson. — Undoubtedly. It needed somebody to watch such a crowd as that. It was obviously necessary to watch that gang.

Now, may it please your Honor, this speculation being launched, the injunction being granted, and the chromo mill being started, they had to come into this court, because they could not run on without being brought here; and they filed an answer. I will now show your Honor what that answer is. Let us have the chart by which we are going to sail. The answer is the chart. This court is a court of equity, which is to try the issues of law and fact *presented in the pleadings,* and not any other.

The answer, may it please your Honor (defts, i, 7), begins by saying that Daniel Drawbaugh —

> Constructed and operated practical working electric speaking telephones at said Eberly's Mills, and exhibited their successful operation to a great number of other persons resident in his vicinity and elsewhere. That the said electric speaking telephones so constructed and *successfully and practically used by him, as aforesaid,* contained all the material and substantial parts," and so on: "and also contained other important and valuable inventions in electric and magneto telephony, and were fully capable of transmitting, and were actually used for transmitting articulate vocal sounds and speech between distant points by means of electric currents; *that some of the original machines and instruments, invented, made, used and exhibited to many others* long prior to the said alleged inventions of said Bell, or either of them, *are still in existence, and capable of successful practical use,* and are identified by a large number of persons who personally tested and used and knew of their practical operation and use."
>
> When?
>
> "In the years 1870, 1871, 1872, 1873, 1874," specifying those years.
>
> "And both subsequently and prior thereto."

That is, that *those* machines "are still in existence and capable of successful practical use"; and that they were used in 1870 to 1874, and subsequent and prior thereto.

The answer then says,

> "that for more than ten years prior to the year 1880" [Drawbaugh] "*was miserably poor*, in debt, with a large and helpless family dependent upon his daily labor for support, and was, *from such cause alone, utterly unable to patent his said invention or caveat it or manufacture and introduce it upon the market.*"

There is a picture of poverty and misery, may it please your Honor, that when I first read it drew tears of sympathy from my eyes. A man with the great invention of centuries in his hand, fully perfected and in practical use for years, was so miserably poor that he could not get fifteen dollars! That was destitution; and if a judge won't decide a case on that, he won't on anything.

In further defence they say,

> "that the said Daniel Drawbaugh, after making, testing, using and extensively exhibiting his invention to others, and allowing them experimentally to personally test and ascertain its successful practical operation and utility, as aforesaid, and after the full and repeated demonstration of its successful working, as aforesaid, concluded that its range and capacity of usefulness to the public might be very greatly enlarged,"

and thereupon he invented all the microphones in the world and the Blake transmitter.

They then say,

> "that, notwithstanding his embarrassed and impoverished pecuniary condition, *and his utter want of proper mechanical tools, materials and appliances to conduct such work*, he labored with all reasonable diligence to perfect and adapt his said improvements, and did, finally, in due exercise of such reasonable diligence, perfect and adapt the same," and so on.

On the next page they tell us that in 1880 he applied for a patent; he had then raised the $15. How it must have cut the heart of the ninety-nine-cent man to give it to him! but he did. But that was after they had got the $5,000,000 of "cash" capital, and the $20,000 in money.

At the bottom of that page 9, they say,

> "that said Drawbaugh's original invention was complete, successful, operative and practically and successfully operated, and reduced to practice as a 'speaking telephone' on many occasions, in the presence and hearing of many other persons, and knowledge thereof was *freely communicated to the public by said Drawbaugh; and that*

said Drawbaugh's improvements, additional to his said original invention, were complete, successful and practical inventions; that all of his said inventions were fully reduced to practice."

On the tenth page, they say, notwithstanding the allegations on the ninth page, that this invention was reduced to practice and "*freely communicated to the public*," yet that no telephone has ever been put in public use on information derived from him. I will read it: —

> "This defendant, further answering, says that, so far and to such an extent as electric telephones were put on sale and into public use in this country by others than said Drawbaugh, prior to said Drawbaugh's application for a patent thereon" — that was 1880 — "*such specific machines and instruments so put on sale and into public use were not the specific machines and instruments invented by said Drawbongh, as aforesaid, but were machines and instruments invented by others* subsequently to the original and first invention of the electric speaking telephone by said Drawbaugh, and subsequent to the invention of his said improvements thereon, as aforesaid."

Notwithstanding that it was "freely communicated to the public" and given to the world, yet up to 1880 no telephone had ever been made based upon his invention; but the hundred thousand telephones that were in use at that time, and in that year, were made in consequence of the inventions of other people, who had no knowledge or information about Daniel Drawbaugh, and who went on with malice prepense, to go and do it right over again, when they ought to have known he was the man, — ought to have dug him up and found him out, and got their information from him.

Now was ever such a picture as that exhibited in a court of justice? That is their answer. How true or how false it may be must determine the result of this investigation. If that answer is false in any particular that is material to this issue, the defendants are out of this court.

It is false, may it please your Honor, *in every particular*, except in that one which says that the world got the telephone from somebody besides Daniel Drawbaugh. That is true; but, with that exception, there is no statement in that which I have read *that is true, or bears the most distant resemblance to truth.*

But that answer, may it please your Honor, was not sworn to by

Daniel Drawbaugh; it was sworn to by somebody or other, I don't know who, — some of this New York crowd,—and therefore Daniel Drawbaugh might say, "I am not responsible for the lies of my partners." We proposed to shut that door up and not let him say that; and thereupon we put to him, in his cross-examination, this question (defts, ii, 926): —

> "*X Q.* 775. Will you look at a printed copy of the answer which I now hand you, and especially at the tenth, eleventh, twelfth, thirteenth, fourteenth, fifteenth and sixteenth sections, and, after reading these sections carefully, tell me whether the statements therein contained, so far as they relate to yourself and your history, are in accordance with the information which you had given the defendants, or their counsel, and were justified by what you had told them?
>
> "*A.* Yes, sir, to the best of my recollection, *that is in accordance with the statements or history of the invention which I had made.*"

He had made that answer for them, and they had sworn to it. He is the man,— the indorser I have no account with. The maker of that note I call to this bar. He was asked: —

> "*X Q.* 776. I call your attention to a statement in the eleventh section, in these words: that said Drawbaugh, for more than ten years prior to the year 1880, *was miserably poor, in debt, with a large and helpless family dependent upon his daily labor for support, and was, from such cause alone, utterly unable to patent his said invention, or caveat it,* or manufacture and introduce it upon the market. You understand this to be a statement, do you not, that before 1870 the cause and the only cause why you did not patent or caveat your invention was your extreme poverty?
>
> "*[Objected to by Mr. Hill as putting an incorrect construction upon the said statement quoted from the answer.]*"

That is good!

Now let us hear Drawbaugh: —

> "*A.* *I can't say it was extreme poverty*, but I felt myself unable, because I made applications to other parties to take an interest. At that early day I knew that it was necessary to experiment for the purpose of making the machine as perfect as possible, and I know that I had no ready cash or money to secure patents; for that reason I asked others to take an interest in it."

That is what Drawbaugh says. He can't go the "extreme poverty" they swear to: that was too much for his stomach; he put it in the answer, not expecting to be called up to the bar to verify it. He says, "I can't say that." I should think not, may it please your Honor, I should think not. His accounts are before the Court. He had an enormous capacity for getting all the money he wanted for all his vagaries and fooleries; and he worked that capacity to the utmost on that neighborhood, and got large amounts of their money. He had an astonishing capacity. There is no other character that I know of that so nearly resembles this man as Harold Skimpole. He is a vulgar Harold Skimpole.

Mr. Hill. — Who is that?

Mr. Dickerson. — Well, you never read enough books to know if I should tell you.

Well, sir, to come to the next part of the answer. He swears, sir, that he hadn't tools enough, nor mechanical appliances enough, to make a telephone, and therefore he could not get on as he should. He swore to that specifically, and we brought him to book on that.

Your Honor now knows that Daniel Drawbaugh's neighbors put about thirty thousand dollars into his inventions along in that time, — about twenty thousand dollars of it in tools for his shop. That shop was stocked with tools in 1867, and it kept on having more put in right along all the way up to the time of this controversy, or until long after the important facts of this controversy had existed.

We will first examine Mr. Hill as a witness. Will your Honor do me the favor to turn to the three hundredth page of the defendants' brief, the first paragraph at the top of the page. It is one of the issues here. We denied this averment of the answer. The defendants say of our denial, in their brief, p. 300: —

> "Let us see if the complainants do not *misrepresent* the fact here also."

Your Honor now sees how we have been charged with grossly misrepresenting the facts. I will read Mr. Hill's brief on this subject: —

> "Up to July 1, 1873, Drawbaugh had the use of the old Faucet Company's tools and machinery. These were special tools, adapted to making faucets, and not to electrical machinery at all. From 1873 to May, 1876, these tools belonged to the Haucks, and Drawbaugh *had no right to use them*. In May, 1876, they were removed from the shop. From March, 1875, to some time in the fall of 1876,

the Axle Company's tools were at the shop, but they, too, were special tools, adapted to making axles, and not to electrical devices, *and Drawbaugh had no right to use them.*"

That is the statement we point to, your Honor, of a man who knows this record much better than I do, sir, for he examined the witnesses himself, — mark it!

Now I call Daniel Drawbaugh (defts, ii, 997–8). Mr. Hill, on his honor, assures the Court that Drawbaugh was not entitled to use any of the tools of those two companies. He knows, of course, and we know, what estimate he has formed of men who misrepresent facts, and he wouldn't, of course, do so! Drawbaugh was asked (defts, ii, 997): —

> "*X Q.* 1113. While the Haucks occupied the shop, *did you have the use of the shop and tools in the same manner as you had while the Faucet Company was there?*
>
> "*A. Yes, sir; they gave me that privilege.* I had a small room in the upper part of the shop, that I occupied during the time they were there; the machinery, generally, was on the lower floor, and I did not use it unless they were not there, or were not using it. *There was a pretty large portion of the time they occupied the shop that they were not running; there was months, sometimes, that they wouldn't come to the shop.*"

Of course, your Honor is expected to believe Dan's partner, and not Dan himself, although his story is not sworn to, but only put in print for the benefit of your Honor.

Now we will turn to p. 998. Dan was asked: —

> "*X Q.* 1116. Did you have the privilege of using the machinery of the Axle Company while it occupied the shop?
>
> "*A. Yes, sir;* at times when they were not using, I used their machinery, often at night."

YES, SIR.

I wouldn't for the world ask your Honor to doubt Mr. Hill's testimony, but that does look suspicious.

MR. HILL. — "At times when they were not using it." You didn't read the whole.

MR. DICKERSON. — Drawbaugh has been certified to be a man of veracity; and I think that, since he swore to it, it may be taken as some evidence that the statement in this brief is false.

4

Mr. Hill. — He said he used it at times when they were not using it.

Mr. Dickerson. — Now, sir, these are some of the issues raised in that answer which your Honor is called upon to try as questions of fact, and you are called upon to try them as questions of fact under the rules of law. What are those rules? They are these: When a patent has been granted; when an inventor has complied with the requirements of law, and given to the world his invention, and somebody else comes in and says he is the first inventor, he must prove it beyond any reasonable doubt; *and to raise a doubt is to resolve it against the claimant.*

Those are the principles of law, well settled. He must prove it beyond a reasonable doubt, and to raise a doubt is to resolve it against the defendant. Those rules, may it please your Honor, have been made necessary, and have become embodied in the law of patents; because the moment an invention is made, the moment it is brought into public use and published, it excites the cupidity of knaves all over the world, and, as Judge Grier said in Goodyear's case, in which I had the honor to assist in the argument, "envy robs him of the honor and speculators and pirates rob him of the profits." And so the law surrounds a patent with a protection so high that no attack can surmount it except that which comes with clean hands and a pure heart and is free from doubt. If it be contaminated with fraud or with doubts, it is dead.

We have had a commentary here upon the case of *Coffin* v. *Ogden*, 18 Wall. 120, and, as some little things in that case may have escaped the attention of your Honor, I will recall your mind to it.

That was a case, may it please your Honor, in which an inventor, before the date of the patented invention, invented a lock, — a trifling affair to be sure, but a thing exactly similar to the patented lock. *It was admitted by the patentee that the claimant did so invent it at the time he said he did*, which was before the time when the patentee invented his invention. It was admitted that he invented it before the invention of the patentee.

Mr. Hill. — What case was that?

Mr. Dickerson. — Coffin *v.* Ogden, 18 Wall. 120.

Mr. Hill. — Where do you find any such statement as that in the record?

Mr. Dickerson. — It would do you a great deal of good to keep silent, because every time you ask a question you are more exposed. I have no objections to your asking these questions, but I tell you, for your sake, that you had better not.

Where do I read it? From 18 Wall. 121. The Court says: —

> "Kirkham [the patentee] made his invention in March, 1861. This is clearly shown by the testimony, and *there is no controversy between the parties on the subject.*
>
> "It is equally clear that Erbe made his invention not later than Jan. 1, 1861. *This was not controverted by the counsel for the appellant,*" — it was admitted at the time that he made that invention, it was not controverted, — "but it was insisted that the facts touching that invention were not such as to make it available to the appellees as against the later invention of Kirkham, and the patent founded upon it."

This was simply a demurrer to evidence, — to admitted facts.

The patentee admitted that the earlier man made his invention, but contended that when he made it he did not so deal with it as that he could deprive a subsequent patentee of the benefit of his patent. Why not? Why, because the first inventor did not put it into such public use as to give the public the benefit of it, and, therefore, ought not to deprive of his patent a subsequent man who did. That was the question of fact, and of law.

Then the Supreme Court said: "Here it is abundantly proved that the lock originally made by Erbe was complete and capable of working." That is the *first* point. The priority of Erbe's invention was clearly shown. The *second* point is, "it was known at the time to *at least five persons*, including Jones, and probably to *many others* in the shop where Erbe worked." The *third* point is, "and *the lock was put in use*, being applied to a door, as proved by Brossi." And the *fourth* point is, "it was *thus tested, and shown to be successful.*" Therefore the patent was defeated.

Now that is not any new law: it has been law forever. The only question there was, how much public use must a man make of a prior invention in order to defeat a subsequent patent? He must put it into successful use, says the Court. If he has done that, — if he has put it into use and proved that it is successful, and has done that *in the presence of a number of witnesses*, — that is the end of the case. But all that was admitted in that case is denied here.

That case, however, may it please your Honor, warns us of another danger. In that case the patentees attempted to suppress the testimony of witnesses who proved the former invention. They threatened to turn them out of employment if they testified; and the Supreme Court commented on it with that severity which such conduct deserves, and on that account gave still further confidence to the testimony.

It warns us, may it please your Honor, not to be found in any such condition as that. It warns us to be careful that we are not suppressing the truth from the Court; not deceiving the Court for the purpose of carrying out any nefarious plans. That is a good warning.

The other side, may it please your Honor, have attempted to put us in that position, knowing how the condemnation of equity rests upon such conduct.

And now, before I go further into the case, I propose to clear up our record; and when I have done that, may it please your Honor, I shall expect to stand before this Court as the advocate of a cause that is as pure as snow; that is not contaminated by anything but by the breath of calumny and the vituperation of slander, poured out in this presence.

One other case for a moment,— the Atlantic case,— Atlantic Works *v.* Brady, 107 U. S. 203. The testimony was all one way. I mean by that, *the testimony of witnesses*. A number of witnesses proved — so far as witnesses can prove anything — that the invention there was anticipated by the machine made by a certain man. Then that man's acts — his conduct — were proved before the Court, and were not disputed; but they were such as no man would have done if he were the inventor. The Supreme Court said, in respect to the testimony, "*It may all be true, — but we cannot give it effect " against* WHAT HE HIMSELF DID, AND DID NOT DO, *without disregarding the ordinary laws that govern human conduct.*"

That was the rule of law laid down by the Supreme Court; and may it please your Honor, a similar rule governs us all in our daily life. When a fellow comes to you, and brings a certificate from his clergyman to show that he is composed of the cardinal virtues and of the Ten Commandments, and produces witnesses to prove that his reputation is good, while he puts his hands in your pocket and steals your pocket-book, you will look at his acts and not at his witnesses. Human conduct speaks louder than human testimony given by the breath of erring and mistaken man. Conduct is the logical consequence of antecedent causes, just as the movement of the heavenly bodies is the consequence of the law of gravity; and when you know the law, you know what the conduct must be, and *conversely*.

But your Honor also knows that from the days of Ananias and Sapphira till now, man is desperately wicked, and given to sins of all kinds; and that lying is his normal condition. Education and civilization bring a man above it. The natural tendency of the human animal is to lie. A child — almost any child that was ever born — will lie. When the conscience is educated, when the sense of moral responsibility is elevated, when the laws of ethics and morals are comprehended, when example impresses itself upon the growing character, then vice is eradicated. Why, the world fell because its first ancestors lied! It was the normal sin in the animal from the beginning.

Now, may it please your Honor, I am going to clear our record, for I don't want it to stand here charged for one moment, or left for one moment under the charges your Honor heard yesterday, — charges that were sufficient, if true, to load with infamy their object.

If it be true, what Mr. Drawbaugh's partner told your Honor yesterday that we had done, it would be your duty, and I have no doubt your pleasure, to close the doors of this court room to us. We ought to go out of it, sir, branded and disgraced. If those charges, on the other hand, are calumnies, it needs no imagination to transfer to the other side the consequences.

Now, I begin, sir. We are charged on this brief of these defendants with "deceiving," "imposing upon," "misleading" the Court by false statements of the facts and the evidence.

In this case, may it please your Honor, Bayler was a witness who had sworn that Daniel Drawbaugh was in great poverty, and that his poverty was of such a character that Drawbaugh always got from him everything that he owed Drawbaugh as fast as he could get it, but that Drawbaugh would always be in his debt for that which Drawbaugh owed him. We made that statement in our speech, and in our brief, and exposed its falsehood. Mr. Hill told your Honor that our reply to it was a gross misrepresentation of the facts; and he read out of the argument of Mr. Storrow to show that he had misrepresented the facts by saying that Drawbaugh always got his payments *in cash* from Bayler, and that he never, himself, paid anything, but was always delinquent. And he said that our denial was false, and that the contrary was entirely the truth; and he undertook to read the evidence for that purpose.

Now, sir, they called Mr. Bayler, and asked him this question (defts, i, 160): —

> "*Q.* 20. Do you know what Mr. Drawbaugh's financial circumstances were during the time that you were engaged in the lumber business at New Cumberland?
>
> "*A.* Only from hearsay, and my own knowledge is, hard to get money from; didn't ever seem to have any, *for his repairs that he made for us he would collect very close, and would want the money for the repairs, if he owed us or not.*"

That was their statement, — "for his repairs that he made for us, he would collect very close, and would want *the money* for the repairs, if he owed us or not." Isn't that *cash?*

Thereupon Mr. Hill read Bayler's twenty-fourth answer as qualifying that, and to show that Bayler did not say *cash:* —

> "Frequently he got lumber from us; account was settled through repairs, excepting the last bill, about the end of my business transactions there, for which I hold a lien against him, or somebody else, I don't know which any more. When I left I placed the settlement of everything, — the collection, — and gave the party a power of attorney."

Now, please your Honor, the fact was this: Bayler was Drawbaugh's debtor, *as the accounts produced in court show*, every day, for years along, until finally Drawbaugh heard there was going to be some doubt about Bayler's paying, and then he bought a lot of lumber from him, in order to cover the balance that was due him. He didn't want the lumber at all. He bought it to balance his account, and had to sell it to get his money. Not knowing the exact balance, he bought about fifteen or sixteen dollars more than the debt; and that balance was the subject of a subsequent suit (Drawbaugh, defts, ii, 1018).

Mr. HILL. — Where do you get that?

Mr. DICKERSON. — That is what was done, exactly what was done. That was the transaction, and the account shows that Bayler was in debt to Drawbaugh all the time, right along, and may it please your Honor, Bayler was called to prove that Drawbaugh applied to him in vain for money to patent his invention. That is what they called him for, — to prove that Drawbaugh applied to him for money to patent his invention. The very day when the supposed conversation occurred between them, as the books show, Bayler owed Drawbaugh twenty-four dollars and some odd cents, — I am going to be very accurate, — twenty-four dollars and some odd cents, that very day when, according to their testimony, Drawbaugh was begging him to lend him some money to get a patent for his telephone. (See brief, p. 354.)

The next charge against us is, suppressing evidence, and the most infamous accusations were made against us. If they are true, Mr. Storrow and I should stand in the condemnation of every gentleman, and of every court.

Dan's biographical story is the foundation of one of these charges. Daniel Drawbaugh was a man of extreme diffidence and modesty,— we know that he was, sir, because a witness has sworn so. There are some circumstances that might cast some doubt upon it; but it must be true, because it was testified to by a witness who has not been impeached, and, according to the rule which the other side laid down for the decision of this case, we must accept it to be true. Daniel Drawbaugh being a very modest man, there was a history of his county or township being published, and he wished to have his biography published in it. The person who was getting up the biography applied to Drawbaugh for a subscription, and he agreed to subscribe for this history on condition that his biography should appear in it; otherwise he didn't want it. Your Honor knows that Drawbaugh is a man of exceeding bad memory, — I think there has never been in my experience a man of so bad a memory, — and he would therefore naturally wish to have a printed biography of himself about him, so that he might see who he was, from time to time, and know what he had done. Therefore he proposed to subscribe on condition that his biography should be printed; and the agreement was made between him and Scott, the publisher, that Drawbaugh should furnish his own biography, — should supply it himself.

Well, I think your Honor will take a sort of judicial notice that that is the general history of this sort of thing; but here it was specifically proved. Here it is specifically proved that the contract was that Drawbaugh was to furnish his own biography, and that that contract was made as the consideration for the subscription.

The COURT. — By whose testimony does that appear?

Mr. DICKERSON. — By the testimony of Mr. Scott, to which I will refer. It is on p. 716, complts, Vol. I. Mr. Scott is asked: —

"*Q*. 15. Did you make any agreement or arrangement with him about publishing his biography in your proposed book, and, if so, state generally the nature of that arrangement, and what was done on that occasion about preparing his biography?

"*A*. Yes, sir; I agreed to publish a short biography of subscribers at that time, and, in order to obtain this biography, I had printed slips with questions to be answered. I commenced asking him the questions to fill up the slip, and had it partly filled up, when I found that I couldn't get in all he wanted on my slips," — your Honor sees that is no ordinary slip that will take in the inventor of the telephone. He fills a page in history that reaches through time. No mere slip is of any use to him, — "and I told him he had better write out a little sketch of what he wanted for himself, *and he thought so too; and we agreed to leave it that way, — for him to write out a short sketch of his history and mail it to me.*

"*Q*. 16. Did you afterwards receive that sketch by mail?"

Then, of course, his partner, not liking that especially, piled in his objections, as he does all along, by the ton.

"*A*. *Yes, sir.*"

Now, sir, Drawbaugh made the contract that he was to furnish his own biography to this book. Well, greater men than Drawbaugh have done that thing. Judge Catron, judge of the Supreme Court of the United States, when this business of publishing biographies for pay first began, wrote his own biography in Livingston's "History of Great Men," and he began it in this frank and manly way: "Other people pretend that they don't have their own biographies written by themselves, or for themselves. I make no such pretence. I write this." That was honest, and it was so published. That was Judge Catron, of the Supreme Court of the United States, and it is to be found in Livingston's biographies to-day.

Then, may it please your Honor, we heard of this autobiography and went to hunting it up. It turned out that two editions were published of that book; that is to say, probably only one edition, but a good many of them were published without having the biographies in; the editor didn't like that kind of stuff; he didn't want such trash in his book; and he probably printed only as many as would go around for the people who paid for them, and left it out of the others. It was, no doubt, a little fraud on them; but that was the way he did it, and he published the greater part of the books without it, but he published some of the books with it.

But Mr. Storrow had got on the track of this biography, and he was hunting it up. He was informed that Drawbaugh wrote it, and he was hunting up the manuscript. He wanted to get Drawbaugh's manuscript with his own story in. The book itself was in public circulation; Drawbaugh had it, and everybody else had it that paid for it. It was a public record known to everybody; but to get at who wrote Dan's biography was the thing that Mr. Storrow saw was very valuable in this case, because it contained an allusion to the telephone written by himself.

We were hunting that up. We scoured the country; we got witnesses from the West. The whole story comes out here. When Mr. Hill had piled up his contumely upon Mr. Storrow yesterday in this court room with opprobrious epithets, he finally ended with the statement that Mr. Storrow was hunting for that manuscript of Drawbaugh for the *purpose of destroying it*, and that this Court would never have seen it if he had got it. Well, there were two views of that accusation, that struck two men differently; it struck me in that comical and ludicrous way that made me laugh. It struck my brother Storrow with indignation; he didn't see the fun of it, for his honor was assailed. It takes a great deal to move him, but this did, and he said a very indecorous thing; he said, "You lie, sir." He ought not to have said it *here*, but he did. The ludicrous side of it was the assumption that Mr. Storrow would have destroyed the paper he was looking for, which was the manuscript of a published book in common circulation, for the purpose of suppressing the knowledge of the fact that Drawbaugh wrote it. That was ludicrous. But, blinded by rage and interest, Drawbaugh's partner attempted to stab the character of Mr. Storrow by an imputation, which, on its face, was so perfectly ludicrous that no man except the man assailed could have failed for a moment to have seen its absurdity.

And that is what he did here yesterday, and he founded it upon this, may it please your Honor: We had two copies of this book; and the first witness that we called was the man who wrote the account of Drawbaugh's shop as a part of the history of Eberly's Mills, Mr. Nesbit. He wrote nothing else. Other writers wrote the history of different townships, and of other places; and other writers, namely, the people themselves, wrote their biographies. We called Mr. Nesbit to prove that he wrote that history of Drawbaugh's shop, and that he got the information from Drawbaugh himself in his shop, and that Drawbaugh never said "telephone" to him. We put him on the stand, and proved that by him, using a copy which did not have the biographies. We had, however, in the next room Mrs. McDowell, the person who condensed the biographies in the publication, to prove that the original was in the handwriting of Drawbaugh. She was in the next room, with a copy of the book she has to do with. She lived in Cincinnati. We had brought her from Cincinnati to Philadelphia to testify, and she was the next witness who went upon the stand after Nesbit, — Nesbit, then Mrs. McDowell.

Mr. Hill, seeing what was coming, and wishing to make a diversion, such as he has attempted here for a day or two to make from the merits of the case, when Nesbit was on the stand called upon Mr. Storrow on the record to produce a copy of the book *that had the biography in it*, as if that was a matter which could by any possibility be kept private; and upon that call he assured your Honor yesterday that Mr. Storrow's intention was that no copy of the book with Dan's biography in it should ever be shown to the Court; that he was trying to "*palm off*" on you that copy of the publication which did not have the biography in it, for the purpose of showing that Drawbaugh was not the inventor of the telephone. *He told you that when he knew, as we all now do, that in the next room was the woman who came from Cincinnati to prove that she condensed the biography from Drawbaugh's own manuscript,* *and that we were trying to prove it; and that the book was a public one, and a copy of it in his own hands.*

But he made that little diversion, — that piece of fireworks, — and then came here and said to your Honor, "If I hadn't done that, this testimony would have been suppressed, and your Honor never would have known that Drawbaugh's biography was mentioned in that book," — in which he mentions the telephone.

In that examination, however, Drawbaugh's partner produced out of Drawbaugh's possession what he says was the *original* of the printed biography, in the handwriting of a man named Hull, which was at once taken into the next room and shown to Mrs. McDowell, and she was asked whether it was the paper she copied from, and she said it was not. That paper was the draft which Drawbaugh had got Hull to write, and from which he copied off the copy that he sent to the publisher, Scott, so that the original, left in Drawbaugh's possession, was in Hull's handwriting. Drawbaugh is not literary in and of himself; he required somebody else to write it for him, and he had got Hull to do it; and then he copied it off and sent it to the publisher, where it was condensed by Mrs. McDowell, at that time engaged in doing that literary work.

Then we called Mrs. McDowell the next day to prove, — not the next day, because Thanksgiving Day occurred, and she had to wait over Thanksgiving Day, — and then she was called to prove what I have told your Honor about it.

Mr. Hill. — Five or six days afterwards.

Mr. Dickerson. — At the next meeting.

I have warned you several times not to interrupt me, because you get hurt every time, and now I am going to hurt you again. Mrs. McDowell was called on Monday. The examination of Nesbit was on the preceding Wednesday. Thursday was Thanksgiving Day, and the examination was adjourned over till Monday, to enable both parties to go home on Thanksgiving Day; and on Monday she was called, and she was asked this question (complts, i, 708): —

"*Q*. 13. On Wednesday last, Nov. 29, 1882," — says Mr. Storrow in the question, — "Mr. Ott, the examiner, showed you, at my request, a manuscript in pencil, marked 'Exhibit Hull Manuscript'; was that or was it not the manuscript which your father gave you to write this biography of Daniel Drawbaugh from?

"*A.* It was not. [*The examiner notes that he did so show said exhibit to the witness immediately after adjournment on Wednesday.*]"

There was this witness from Cincinnati, on Wednesday, in the next room, to whom this piece of paper *was shown that day;* and now Mr. Hill, knowing that to be so, says that "there were four days elapsed, and therefore there was time enough for us to have got up that fraud that we have since come in here with." He told your Honor that we concocted the *pretence that Mrs. McDowell was to prove Dan's autobiography* as an excuse for our attempt to suppress from the Court a published book, one of which was in Dan's possession, and had taken four days to do it in, when he knew that Mrs. McDowell was in the next room with the proof the same instant that Nesbit was examined, and was waiting, absent from her home in Cincinnati, to be called, and would have been called that day if the court had not adjourned over Thanksgiving.

Now, what is the next thing about this affair? Mr. Hill puts in his brief this statement (p. 261 of his brief): —

"A great many facts appear in the case which curiously emphasize the worthlessness of negative evidence. Take, for one example, the testimony of J. C. Nesbit. He was at Drawbaugh's shop in July or August, 1878, with one Hull (who died in the spring of 1879), to procure materials for a historical sketch of Milltown, to be published in Wing's 'History of Cumberland County,' and was called to prove that Drawbaugh did not mention the telephones. In connection with his testimony, the complainants introduced the history containing a brief sketch of Milltown, and even of Drawbaugh's shop, but silent as to telephones. In cross-examination, however, the defendants produced a manuscript made by Hull," — now we are coming to the statement, — "*made by Hull at that very visit, which conclusively showed that Drawbaugh did mention the telephones, — both carbon and magneto, — as his invention;* and upon the defendants' demand, the complainants were obliged to put in another copy of the same history, which was printed at the same time, with the copy they first introduced, and which contained in an appendix the substance of Hull's manuscript statement about Drawbaugh's telephones. Here was shown not only a reprehensible effort on the part of the complainants to DECEIVE THE COURT, by introducing an incomplete book, but also an unanswerable rebuttal of the witness's negative testimony by means of *a writing made during the very interview which formed the subject of his deposition.*"

The italics and capitals are mine, the meaning is his.

The important words here are "*made during the very interview.*" The subject of that is Nesbit, who swears, "When I was taking the notes that I published in the history, *he said nothing about telephones.*" But Drawbaugh's partner now says, "Yes, he did." How does he prove it? Why, he pulls out of his pocket the biography which *he says* Hull wrote *at "that very interview"* with Nesbit, and therefore Nesbit must have lied, who said that telephones were not mentioned.

Now, may it please your Honor, if Hull did write that biography at that "very interview," then, of course, the conclusion is good. If it was not written at that "very interview," — and nobody knows better than Drawbaugh and Drawbaugh's partner what the truth is about it, — then the conclusion is false; and that falsehood is made the basis of vile accusation against us. What is the fact?

Mr. HILL. — I want to offer your Honor the original of Hull's manuscript, the original notes made. Here it is. [*Handing the Court two leaves of paper.*] Your Honor can see that they are parts of the same paper, written at the same time, from the marks and corrections on both sheets.

Mr. DICKERSON. — That is, anything that is written upon two halves of a sheet of paper was necessarily written at the same time. Any man that cannot see that must be a dunce. I write a note on my table and tear the sheet of paper in half, and then come back in a week and write another letter on the other half of the same sheet of paper; *ergo*, they were written at the same time. That is logic. But the paper shows that the contrary is true, and there was no attempt to prove this supposed coincidence by testimony.

But, your Honor, I am not talking about that kind of logic. I am talking about testimony now. Mr. Scott is the witness (complts, i, 715): —

"*Q.* 10. Did Mr. Daniel Drawbaugh subscribe for this history; and, if so, will you point out his subscription, in order that the examiner may copy it into the record?

"*A.* He did subscribe. [*Witness points out the subscription in the subscription book.*] 'We, the undersigned,' and so on."

Here is the list of all the subscribers, and we come down to Aug. 21, 1878. It is the original paper: —

"Daniel Drawbaugh, one copy, August 21, Eberly's Mills."

On the twenty-first day of August, Daniel Drawbaugh made that subscription.

The COURT. — Of what year?

Mr. DICKERSON. — 1878, when the Bell telephone had filled the world.

The COURT. — Is there reference to that in the brief?

Mr. DICKERSON. — Oh, yes, p. 222; there is no doubt about the date of the subscription. Daniel Drawbaugh, on the twenty-first day of August, 1878, subscribed for that book. It was published in February, 1879, and Drawbaugh then received his copy. Now, says Mr. Hill, this biography was written by Hull at the same time when Nesbit, the writer — not Scott, the publisher — *when Nesbit, the writer*, got his information from Drawbaugh which he put into his history. That is what he says. He says he proves it by the looks of that paper.

Well, the looks of the paper are not quite as good evidence as the testimony of the witnesses as to the dates. Nesbit testifies that he took his order from Scott to write the history on the 7th of July, and he finished it three weeks before the 1st of September, which was the time when his school began; he is a teacher; *he finished it about the 10th of August.* He had finished his long history of the whole town in manuscript on the 10th of August, which was eleven days before Daniel Drawbaugh made the contract with Scott under which he was to furnish his biography; so that eleven days before that time Nesbit had finished his history, and it was some time between the 1st of July and the 10th of August when he went to Drawbaugh's shop for his facts about Eberly's Mills. He doesn't remember what day it was, but it was some time between the time he took the contract to write the history and the time when he finished it; it was within forty days, — say from the 7th of July to the 10th of August, some time in there,— that he saw Drawbaugh and got his materials. On the 21st of August, ten days after he had written his history, Scott, the business man, went there, and Drawbaugh agreed to subscribe for a copy if Scott would publish his biography, and did so, and *that is the first that ever was done about the biography.*

And now his partner comes here and tells you that in fact that biography was written in Mr. Nesbit's presence a month before, when he went to get his information about the town and the mill, and that therefore Mr. Nesbit doesn't tell the truth when he says the telephone was not spoken of at that time. There is no other evidence bearing on the subject.

That is the testimony in the face of which this infamous charge is made against us, in this presence, that we have corrupted the testimony and suppressed the truth, and that we have attempted the crime, may it please your Honor, of keeping away from the Court the fact that *Daniel Drawbaugh himself wrote his own biography,* — a most important fact for us to prove, and to prove which we spent no end of time and money: a fact too one would think was rather difficult for us to conceal from Drawbaugh.

But we had an elegant piece of commentary yesterday. Mrs. McDowell swears to two things. First, that her father, who was Mr. Scott, gave her this manuscript from Drawbaugh, and told her it was Drawbaugh's manuscript. That was *four years before she testified,* and she remembered that conversation. Thereupon Mr. Hill stood up in this Court and said to your Honor that it is not possible for human memory to recall a conversation of four years ago and tell the Court what it is, that human memory does not act so.

Well, if your Honor please, I agree in general terms that human memory is not very reliable about a conversation that occurred *four years ago.* If this case depended upon proving that conversation, I shouldn't have a great deal of confidence in it. I would agree with anybody who should say that human memory is very fallible; but what do you think, may it please your Honor, of this confession of Drawbaugh's partner, when the great bulk of his testimony depends upon witnesses who say that ten years ago, twelve years ago, sixteen years ago, they heard Drawbaugh say so and so?

Does memory improve, like Madeira, by the years in which it is kept? I think, may it please your Honor, that it is like currant wine, it gets sour.

Why, may it please your Honor, in this case Henry Drawbaugh, the brother of Daniel Drawbaugh, and his chief witness, swore, in his direct examination, "The first time I ever saw any talking machine was in 1872." He positively fixed it, if his testimony fixed anything. No doubt he and his brother had agreed about it before he went on the stand.

Well, after a while that piece of testimony began to look very ugly. How was it that an invention that had been completed and known to the whole community, and published to everybody, for five years, was not known to the man's own brother? How did that happen? They had to mend that somehow. That was a very damaging hole, and they had to mend it. And how did they try to mend it? Why, they called a couple of land surveyors, who were running a line in the woods, — and they make your Honor sure about that line, because they produce the record showing when it was run, — there is no doubt about that date, and *therefore* of course no doubt about the rest of the story. See brief, 396; app. 112, 719.

And what did they say? Why, *they heard a man say that he heard Henry Drawbaugh say that his brother Dan had a talking machine as early as* 1867, *or some such time.* They heard one man say that he heard another man say that which contradicted their own witness in respect to the date when he knew it. And then they stand up in court before your Honor and say that human memory as to a conversation four years old is worth nothing. But they tell you in the same day, and with the greatest earnestness, "We have proved without a doubt that Henry Drawbaugh knew all about this talking machine in 1867, because we have got two land surveyors who heard a man say that he heard Henry Drawbaugh say so some years before, — sixteen years before, — *sixteen years before.*"

May it please your Honor, whenever a complicated fraud is got up, it is impossible for human nature to make its parts match. Whenever, in the providence of God, a knave is made, a fool is put inside of him every time. If it were not so, the world would be uninhabitable. The protection which virtue has against knavery is the fool inside of the knave.

Now, sir, we come to another suppression on our part, and this is as bad as any of them. It is the suppression of the Miller testimony. Miller was called by the defendants to prove —

The Court. — Is he the man from the West?

Mr. Dickerson. — No, sir, I will come to him; this man was the station agent at Whitehill, and kept the co a word of evidence man Miller was called by the defendants to prove certainly the time. a talking machine in Drawbaugh's hands in 1876, w the testimony by chine was A, — that round machine. He had seen it coal business road station where Drawbaugh had shown it. He then said that Drawbaugh had talked to him about it *before that time, August*, 1876. It wasn't a very valuable piece of testimony, in view of the date of Bell's patent, but it was a very good thing to date another thing from, — that he had talked to Drawbaugh *before that time about it*, although Drawbaugh hadn't shown it to him before that time.

Well, that was very good-looking testimony. The question then arose, when Dan talked to Miller about it, and Miller fixed it by the circumstance that he went to collect a bill for coal, of his father's, and at that visit Dan talked to him about his telephone. Miller also helped the poverty dodge a little by saying that he didn't press his bill because he was satisfied Dan had no money. Well now, we have got something logical. We have got a good connection. It was a bill of coal; he went there to collect it.

Thereupon Mr. Storrow went into bookkeeping, and he hunted up Mr. Miller and his books, and this turned out to be the fact: Mr. Miller, the father, who kept the coal store, — it was called the "warehouse," — where they sold coal and such things, next to the railroad station, came there to that store on the 1st of January, 1876, — *came there on the 1st of January*, 1876, *and not before*. The people who occupied the store before him were two or three other tenants; all of their names and dates are given exactly, and they came in one after another, until Jan. 1, 1876, when Miller's father took it; and this young man, young Miller, having been station agent for the railroad company, took charge of the warehouse for his father, which was at the station. He began that business then, and afterwards he opened an account with Dan Drawbaugh for coal.

The first item of coal on that account was in *December*, 1876. The first *bill therefore* he had against Daniel Drawbaugh was in December, 1876. Well, it isn't probable he went to collect any bills before he had them; and therefore it isn't probable that the conversation his direct examinatio bill occurred before December, 1876. Then machine was in 1872 against Drawbaugh for coal, running along anything. No do 1878, and we produced those books, if your he went on the. We produced Mr. Miller and his books, and then Mr. Storrow said to him: Now give us the *account from the beginning of 1876*, — Drawbaugh's account, —*from the beginning of 1876 until the present time.*

The beginning of 1876, may it please your Honor, was the beginning of his business. It was the beginning of his account. Jan. 1, 1876, was the opening of the books, and Mr. Storrow took it from the beginning, and said, "Give us the whole account"; and he did.

Thereupon Mr. Drawbaugh's partner stood up here and said, "This is a fraud. Why didn't Mr. Storrow ask him for his account before Jan. 1, 1876?" and he insinuated to the Court that there was an account before that time on those books that we didn't go into. Well, he knew as well as we did — there it is on the record — that Mr. Miller went there Jan. 1, 1876, from another place, and began his selling of coal in that year, and sold the first ton of coal to Drawbaugh in December, 1876, eleven months after he first went there.

And then, may it please your Honor, "it was in warm weather," says young Miller, "when Dan showed me the machine on the railroad station." He continued to be the railroad station agent for a long time, — 1876 to April, 1878. "He showed me the machine in the summer some time." It wasn't the summer of 1876, because he hadn't sold any coal in the summer of 1876; and he went to collect his coal bill and had his talk about the machine before he saw the telephone receiver **A** at the station.

Now, that being the fact on the record, and the whole of it, we are held up here to the contumely of this court as having suppressed the testimony in some books that were *supposed to exist*, when the man wasn't there, and had no such business, and your Honor is told, "What do you think of counsel in a case that would do such frauds as that?"

Mr. Hill. — Do you mean to say that Mr. Miller was not in business at Shiremanstown or White Hill in or prior to 1876? The man didn't say he collected a bill for coal bought at White Hill; for coal bought of his father, he said. There is not a word of evidence about his having bought coal after 1876. That is certainly the time.

Mr. Dickerson. — Oh! you seek to supplement the testimony by saying, "True it is he was not at that place in the coal business in 1876, but he was at Shiremanstown, four or five miles off, and probably he sold coal from Shiremanstown or somewhere else.' Well, if he did, this young man did not sell it; this young man didn't have charge of it; this young man was at that station nearest to Drawbaugh's house — the Whitehill station. And now, says Mr. Hill: "Oh, the father was in the business formerly half a dozen miles from there, and *probably* this amount might have been on some transaction between them at that time. Why didn't you go to his father and get the books of that place, not get the books of the place where the transaction occurred?"

Mr. Hill. — He said he went to collect the account for his father!

Mr. Dickerson. — You don't make anything by that. You only get hurt every time; it only makes the subterfuge the more ridiculous. The more you utter it the more absurd it becomes.

As my brother Storrow reminds me, *they* afterwards called this young man Miller again about this very transaction. They never asked whether this bill did not relate to something else besides that coal business, in which he was the agent of the father, and elsewhere than the store where he was selling coal at the time the transaction occurred. They didn't ask him that question. Of course there was no other coal bill. Men don't cart a ton of coal six miles when they can buy it next door.

The earlier occupants were Zacharias & Graybill, who quit in September, 1875, after which the owner, Jackson Free, closed up their business. (See defts, iii, 183–5. See our brief, p. 305.)

I now come, if your Honor please, to those Western witnesses, whose testimony is important in several aspects, both upon the merits of the case and upon the accusations against us of having suppressed the testimony which the Court was entitled to know.

There were several of them: the Ditlow brothers and a man named Kahney, of which name there are more than one. We were attacked ferociously, with burning epithets, for having manufactured testimony and procured witnesses to "swear straight," — not doubtful or hesitating; and there was read to your Honor the testimony of a man named Ditlow, to impeach the character, professional or otherwise, of Mr. Storrow. He was asked this question (defts, iii, 523): —

"*Q.* 19. Did you get any instructions from them [*i. e.*, Mr. Storrow] as to how you were to give in your testimony; if so, what?

"*A.* Yes, sir; we were trying to fix dates. Mr. Storrow would ask me questions about dates I could not remember, — I could guess at it, so and so. He told me when I went on the stand not to *guess* at it, *give a straight answer*.

"*Q.* 20. What do you mean by a straight answer?

"*A.* Not to say, 'I believe it was so, or I think it was so,' but to say it either was so or was not so."

Upon which a diatribe was delivered here against Mr. Storrow and against our methods of procuring our witness to swear, when we told them to swear straight, and not to guess at it.

On the next page of the record, may it please your Honor, this witness was asked another question by Mr. Storrow (p. 525): —

"*X Q.* 36. Mr. Storrow cautioned you that upon the stand you should not guess nor say you guessed, but should answer positively one way or the other, if you knew; and *if you didn't know, say that you didn't know, and not guess about it:* is not that the fact?

"*A.* Yes, sir."

That is the *whole* of the testimony of which Drawbaugh's partner read a part. If these instructions to witnesses were put in a text book, they could not be put more accurately than that: "If you know, say you know; if you don't know, say you don't know; but don't guess at it: that is not evidence." And thereupon we were denounced as training the witness to swear falsely because we told him to tell a straight story; and Mr. Hill took care not to read the whole of it: "If you don't know, say you don't know, and don't guess about it."

And then your Honor was asked, "What do you think of the parties and counsel that make up such a record as that?" I retort the question.

The Ditlow story is this. It is a very interesting one. It is as plain a fraud on the part of these defendants to procure false testimony as ever went on the records of a court of justice.

This mill of Drawbaugh's was a loafing place, where, on Sundays and idle and rainy days, the loungers and farm hands and loafers assembled to play cards, to tell stories, and amuse themselves, as happens in country villages of that kind. Among the fellows that were there were the Ditlow boys and the Kahney boys, who were not a very high-toned set of "gentlemen," — trappers, who made a living by poaching around, trapping, and doing a day's work here and there, — laborers, — that was all. But they were such companions as Drawbaugh had. If you want to know what occurs in a man's house, you must call his companions that frequent his house. We cannot call gentlemen, if his house is frequented by loafers; we have got to call his companions, not ours, and we called the Ditlows. To their story hangs a tale that pulls down an immense card house in the middle of this case, — an immense card house.

It will require a little attention to detail to comprehend it entirely. George Drawbaugh was the nephew of Dan and one of their principal witnesses, — a man very much relied upon to prove their case. He was a fellow very much like the Ditlow boys and the Kahney boys, and he swore that the first time he ever saw what they called a talking machine was in 1870, when he was engaged in building a wagon for the purpose of peddling water rams.

Drawbaugh was a manufacturer, among other of his multifarious employments, of water rams; and he and a man named Sadler formed a partnership for the purpose of peddling water rams around the country. Water rams are, of course, very much used in farming countries, where they have little streams of water, and it is a respectable mode of making a living, and no doubt a profitable business. He tells us he formed a partnership with Sadler to peddle rams. George Drawbaugh made a wagon, or repaired a wagon, which was to be used in this peddling business; and he testifies that he made that wagon in the year 1870, and he proved it by the most circumstantial set of associations and by book accounts. He swears that he bought the lumber for it from Mr. Lee; and Lee's books are brought into court to prove that he bought lumber in the spring of 1870, and that he never bought any afterwards. It was therefore certain that it was in 1870. Daniel Drawbaugh himself also hangs a date upon the time that wagon was made. The

Ditlow boys, I say, were living in that neighborhood at that time, but are now in Indiana. We found them out, and called them to prove that the first time they ever heard of the talking machine in Drawbaugh's shop, where they had been spending their Sundays, their rainy days, their idle time, the companions of George Drawbaugh for many years before, — the first time they ever saw or heard of that talking machine was in 1877, — in the spring of 1877, — *when George Drawbaugh came into the village store and told them that Dan Drawbaugh had got a talking machine.*

Joseph Ditlow and Abe Ditlow left that place immediately after that, in the spring of 1877, and went West, to Indiana. Joseph had with him a kit of trapping tools, in which was a stove that Dan Drawbaugh had made for him, and this kit of tools he sent at that time out West, and he happened to have preserved the original bill of lading of the railroad for this kit of tools, which he produced to us when we called him as a witness; and he put his date on that bill of lading. It was just before he left that George Drawbaugh came and told him of the talking machine in the country store, though he had been for years before that an habitué of Dan Drawbaugh's shop and had never heard of such a thing up to that time.

His brother Abe was called in the same way. They were seen by us six months, I think, before they gave their testimony, and they had all that time to consider, and then came upon the stand and testified in the most positive manner that they had never seen or heard of such a thing, although they were there, day in and day out, for years before, until they heard it in the spring of 1877, in that store, from George Drawbaugh. After they had got through with their testimony, and these others with them — Kahney, whom I will speak of separately, — after they had got through with their testimony for us, they turned up at Eberly's Mills and spent a few days there with the Drawbaugh people, and on Sunday spent the whole day in Drawbaugh's shop, where Daniel Drawbaugh and George Drawbaugh and the rest of the family were talking over the telephone case.

On that occasion, Daniel remarked, with that sympathetic generosity which naturally belonged to an expectant millionnaire, that if he won his case, — "*he would remember his friends.*" The prospect of pouring half a million or so into that little village was a very glittering one, and with Drawbaugh to "remember his friends" was very seductive. He would remember his friends; and they talked it all up. The party of witnesses then went West, and presently afterwards the Ditlows were brought back to swear that they were entirely mistaken on the occasion when they first testified, and that, in the place of being 1877, it was much earlier.

Now our wagon date is coming to the front. It was 1870, they say, when the wagon was made and when George Drawbaugh first saw the talking machine. Joe Ditlow went West the first time in the spring of 1870, and boarded with one Reed for a short time, which is fixed by book entries as in May, 1870, and no doubt correctly fixed. Joe has been in the habit of going out West from time to time, beginning in the spring of 1870, at which time he boarded with Reed for six weeks; and they called Reed to prove that Joe Ditlow, *in the spring of 1870*, told him that Daniel Drawbaugh had got a talking machine, and described it. Upon this testimony of Reed, therefore, Ditlow corrected his date, and carried back his knowledge from 1877 to a much earlier time. In order to make the new story match with the one Ditlow had sworn to for us, in as many particulars as possible, so as to correct as little as possible — only the date — they put it to him as follows, when he was recalled (defts, iii, 521): —

"*Q. Where and from whom did you first hear* that Daniel Drawbaugh had a talking machine or anything that was claimed to be a talking machine?

"*A. The Milltown store, from George Drawbaugh.*"

So far the two stories concur. 1877 was the date sworn to for us, and he carried it back some years, and knew he was right, only because Reed said he had been told of it in 1870. *But in both cases he swore that his knowledge was from George Drawbaugh.*

Now George Drawbaugh knew of it for the first time when the wagon was built, which he swore was in 1870. It turned out, *and it stands admitted here, that that wagon was not built until 1871.*

But George Drawbaugh swore he knew of it *for the first time* when that wagon was building, and from him Joe Ditlow got his knowledge, which, therefore, could not have been till 1871, and therefore *Ditlow did not tell it to Reed in 1870.* Reed may have been told of it in 1877, when Ditlow was there again. Ditlow has lived close to Reed ever since 1870; but he certainly was not told of it before Ditlow himself knew of it.

The whole card fabric tumbled. It all depended upon that wagon, which, in place of being made in 1870, was made in 1871; and the whole lie, which was hung upon that wagon, came down with a rush.

Then Mr. Hill told your Honor yesterday that we had corrupted that Ditlow family, when we got them for witnesses, by obtaining *from the railroad a copy of the bill of lading of Joe Ditlow's kit in 1877*, and showing it to them, and thereby making them believe that that was the time, in 1877, and not away back in 1874, which was the first time Joe Ditlow had gone West.

But, may it please your Honor, that bill of lading, in place of being got *by us* from the railroad company, and shown to the Ditlows, *was produced by Joe Ditlow himself, and shown to us as proof of his date*. It was the original bill of lading in his possession, given to us for the purpose of proving his 1877 date, as Mr. Hill knew; and then your Honor is told that *we got* it from the railroad, and corrupted Ditlow with it, and made him believe it was 1877, whereas it ought to have been 1874! That is a lovely story. Nobody knew the truth better than the person who made that statement to your Honor. The original was produced out of Ditlow's pocket; it is on file in the case, and, in place of being used by us to corrupt Ditlow, it was Ditlow's own basis on which he swore (complts, ii, 959).

The fact was, may it please your Honor, that twice when Joe Ditlow went out West he carried with him his kit of hunting implements, — once in 1874 and once in 1877, — so that there was an opportunity to make a false association of ideas. The Western people whom they called, who knew about this thing from Ditlow the year before George Drawbaugh had told Ditlow of it, *according to their own story*, say they were told about it when Joe Ditlow was unpacking his kit of tools. In the very act of unpacking this stove, he said to them, "See here, this stove was made by Drawbaugh, who has made a talking machine down in my country." That kit of tools he carried in 1877, and produced his bill of lading to prove the date. All this matter of the Ditlow family is fully stated in our appendix, p. 585.

Dan got those Ditlow boys down to Milltown to spend a couple of days with him there — two or three days with him — just after they testified for us, and then sent them out West; and then he brought them back to swear their date back, and to produce witnesses that it was 1870, not 1877, when Joe Ditlow knew it. The moment you fix the wagon date, down goes the whole fabric of lies — the whole of them.

There is another lot of the same class of witnesses here. A man named Kahney was a witness for us, and never knew of talking machines before 1876, and afterwards came back to testify that he was entirely mistaken, and that he did know about them years before,— the exact year I will not mention, because it is not of the essence of the matter; the question is, before or after; that is all. He never heard of it until, as he testified to us, until after Mr. Bell's invention. They recalled him to prove he knew of it a long time before. How did that come to pass? He was taken down to Drawbaugh's shop after he testified for us, along with the Ditlow boys, and while he was there with Drawbaugh they talked the subject up, *and Kahney agreed with Dan to find a man out West, by the name of Smith, who would come and testify that Kahney told him about the talking machine long before he had sworn for us he knew of it.* An unknown Smith was to do the Reed business over again.

He was to go out West and hunt up a man who was going to prove that he, Kahney, had told him about a talking machine long before Kahney had sworn to us he first saw it and heard of it.

That is the little contract that he and Dan Drawbaugh made with each other, and he started out West to carry it out, and he went to Chicago to hunt up a man by the name of Smith to prove that he had lied on the stand. Kahney goes to Chicago at the expense of this gang to find a man by the name of Smith to swear that Kahney told him some years ago of something that Kahney had just sworn did not exist. It seems that Kahney did not find that his man would swear to any such thing; and when it is considered how simple a thing it was to get some villain for a price to do this, we must conclude that Kahney wasn't smart: but Kahney found himself, and he wrote back a letter to Mr. Drawbaugh from a place called Triumph — quite significant (defts, iii, surbtl, 225): —

"TRIUMPH Jan the 1 [should be Feby 1] 1883.

"FRIEND DANIEL: —

"I thought I would right you a few lines to let you know that I got back all right again and to let you know that *last night there was some things came to my mind the first that I ever heard of a talking meshien it was in seventy five and know exactly when it was or can find out with very little troubel and thare was a man told me in mendota today and he said he knew of you talking of having being working at the talking maschien in the year of seventy* and LET ME KNOW WHETHER I SHALL SEE SMITH OR NOT right soon for I may leave here soon with this I close my Respects to all address Mendota Lasalle County Ill."

He had not yet seen Smith, but he might come across him in his travels, though he had just come from Mr. Dan Drawbaugh's place, where they had agreed that he should go and hunt up a witness to prove he was a liar. As he writes, "Last night there was some things came to my mind." These people put him on the stand and produced that letter, and Dan's partner asked him a question in order to prove the virtuous nature of it. Let us give them the benefit of that question, because they need it very much (defts, iii, 230): —

"*Q*. 49. And you wrote Mr. Drawbaugh, informing him of it in ORDER THAT NO INJUSTICE MIGHT BE DONE BY THE MISTAKE WHICH YOU SAW THAT YOU MADE AT PHILADELPHIA: is that the way of it?"

In order that no injustice might be done by the mistake which was made in Philadelphia; is that the way of it? We do not desire to take away any of their virtue: it is their right; it is right that the witness should have the benefit of that virtue.

"*Ans*. Yes, sir."

He did it in order that no injustice should be done; and that was why he wrote that letter.

Well, it happened, may it please your Honor (they call him a gentleman; as they associate with him, I presume he is), that this "*gentleman*" wrote another letter, and he wrote it to Mr. Storrow (defts, iii, 243): —

"TRIUMPH March the 8 '83.

"FRIEND STORROW

"I thought I would rite you A few lines to let you know that I got home all right and am feeling as good as ever and to let you know that I herd from Dan and that he wants me to come back again and I have thought over some of my deposition and I find that I have testified to some things that I wasn't right about and would right them if I could or would get a chance and hope that I will I do now believe that thare was a telephone thare as far back as 1873 and know thare was and am glad it has come to my reckalection and am very sorry that I have give in the evidens that I have I have had telephone on the brain ever since I got back and I want you to WRIGHT TO ME AND TELL ME WHAT I HAD BETTER DO I CAN KEEP OUT OF THEIR WAY IF YOU SAY SO DONT FALE TO RIGHT AND GIVE ME ADVISE and tell Comfort that I still play seven up sometimes" [I should think he did, but, unfortunately for him, he did not hold high, but low this time,] "with this I stop your Friend

"ORLANDO B. KAHNEY.

"Adres Triumph Lasalle County Ill."

That letter was addressed to friend Storrow, from Triumph, and he asks friend Storrow to bribe him.

He says, "I CAN KEEP OUT OF THEIR WAY IF YOU SAY SO." Well, friend Storrow, of course, was not in the business of corresponding with that kind of person, and of course he did not make any answer to it.

Then he writes another letter:—

"WARNER HOUSE,
HENRY KOPPEL, Proprietor.
MENDOTA ILL. May the 23 1883.

"FRIEND STORROW

"I thought I would rite you and let you know that I am getting along well and to ask an advise of you whether I HAD BETTER OR NOT COM AND TESTIFY ON THE OTHER SIDE DAN HE SAYS HE WANTS ME TO COME rite and let me know what you think about it.

"ORLANDO B. KAHNEY.

"Address Mendota Lasalle County Ill."

Well, of course we didn't communicate with this "*gentleman*," and this gentleman came upon the stand and had forgotten of course about these letters to Mr. Storrow. He told how his conscience had moved him to write to Dan Drawbaugh, in order that injustice might not be done to anybody, when the whole scheme had been concocted by him and Drawbaugh before he went West; and in consequence of that he had come back on the stand, and then these letters were put to him. Of course they were his; and upon that, may it please your Honor, Drawbaugh's partner puts into his brief the most infamous charge that we had suppressed that testimony, or attempted to; that we would not consent to have this man back on the stand; that we attempted to deceive and mislead this Court by keeping away from it such testimony that we knew was true; and that we prevented the witness from giving it when he wished to give it; and that they ultimately had to take upon themselves the burden of producing it.

Mr. Hill. — Won't you read his one hundred and seventy-fifth answer on p. 244? That explains it.

Mr. Dickerson.—His testimony is of no consequence to any human being on the face of this earth. The reason that he wrote these letters was that he wanted money; he wanted somebody to pay him money. He states in his testimony that Comfort requested him to write to him if the defendants wanted him to go on the stand, and that he wrote to Mr. Comfort and wrote to Mr. Storrow. Of course that is not true in the sense in which you propose to use it. But anything he can swear to of course is of no sort of consequence. He swore that he wrote his letters because Mr. Comfort told him if he found out anything else to come and tell him. But read them. (For the Kahney story, see our appendix, p. 608.)

These are the two cases of fraud with which we have been charged. I am clearing up our record, and in doing so I am demolishing their testimony.

Now there is one more, and that is the testimony of Zearing. Zearing is a farmer, who claimed that he went into that room, and saw one of those talking machines, I, which is the cuspidor-shaped thing, and that it was standing in the middle of the table, and that Dan went out of the room, and that he stood up alongside of the table and heard that thing talking. Now that is what he swore to exactly, and we said so in our brief; upon which we are charged with the grossest misrepresentation, and your Honor is told that, as a fact, the man really held it close to his ear; and to prove that, the following testimony is cited. I will read it to you (defts, iii, surrbtl, 132): —

"*X Q*. 83. You have told us that at the time you heard Mr. Drawbaugh say 'the steelyards are finished,' the machine was lying on a table near the middle, and you were standing by the table: how near, as far as your recollection serves you, was your ear to the machine?

"*A*. I was close to the table as I could be, if my memory serves me right, and was close to the machine."

"*X Q*. 66. My question refers to the time when you heard the words, 'the steelyards are finished.' Will you please answer it with that understanding?

"*A*. If my memory serves me right, I was standing at the time.

"*X Q*. 67. And where?

"*A*. Beside the table.

"*X Q*. 68. About how near?

"*A*. I was quite close.

"*X Q*. 69. Were the words which you have given us in your examination in chief the first words which you heard through the machine, as you supposed?

"*A*. If I remember right, I think he had a date; that is, the month, and day, and year.

"*X Q*. 70. I understand you to say that while this was going on and you heard these words the machine was lying near the middle of a table in the room which you have spoken of: is that correct?

"*A*. It is, to the best of my recollection."

The COURT. — I have read it. It is not necessary for you to read it.

Mr. DICKERSON. — Thank you. That man's story is that he *stood* close by the table and heard this thing talk when it was lying in the middle of the table. (For Zearing, see app, 626)

These, so far as I know, are the accusations which have been made against us for falsifying testimony, "misrepresenting" it, so as to "*deceive" the Court*. If I have cleared our skirts of this accusation, — I have not looked over the reporter's notes, and I speak of these instances from memory, — if I have cleared our skirts from these accusations, I shall expect to be listened to as if the accusations had never been made.

Now this case is launched upon your Honor with the preliminary claim that their principal witness and inventor is a man of high character, and integrity, of wonderful diffidence and modesty, against whom nothing has been proved by witnesses called to say that he would not be believed under oath, and therefore that he must be believed. An appeal has been made to us, and we have been challenged in the brief and orally, to meet that claim of high character for Drawbaugh. I accept the challenge. I propose to show to your Honor out of this record that Dan Drawbaugh was a PROFESSIONAL IMPOSTOR; that he made his living for years by being a professional impostor, — just as much as a bunco steerer in New York makes his living by being a bunco steerer. *He was a professional impostor. I use those words advisedly.*

About 1870, or earlier, — perhaps earlier, — Dan Drawbaugh began to make what he called an electric clock. Upon that clock he spent hundreds of dollars. Indeed he spent thousands of dollars in time and in money. He worked at it for several years. When this case began, it had been for two or three years in a blaze of glory. He had made, at his own cost, five of these clocks, beginning with a simple clock movement hung up on the wall, and running into and ending with a magnificent, elaborately carved and gilded case, seven feet high or more, two feet and a half or so in width at the base, of black walnut, elegantly finished; which clock was, at the last account, according to the testimony, in the city of New York, and in the possession of one Marcus Marx, — I think that is the name, — one of these parties who is keeping it, I suppose, as a monument in honor of Daniel Drawbaugh. That clock Drawbaugh got advertised in the newspapers all over that part of the country. There were most extravagant eulogies upon it. It was said by Dan's friends that "*perpetual motion*" had been obtained at last. It was on exhibition in the city of Harrisburg by a man who had made a contract to buy it and travel with it on a starring tour throughout the State, and exhibit it to audiences for ten cents apiece, or some such price. And Drawbaugh attended the exhibition in Harrisburg from time to time, and explained the clock. He had a friend, a very intelligent man too, a Mr. Lloyd, a school teacher in Harrisburg,— who had access to the public press, — one of the two principal teachers there. He did not know anything about electric clocks; but inspired by Dan he published one of those articles, in which he called upon the State of Pennsylvania to appropriate money for the purpose of having this wonderful invention put into the State House and into the chambers of the legislature, and the like; *the miracle of the thing consisting in the circumstance that it would run without winding, and would run from an earth battery.* (See complts, iv, 386.)

Of this clock it was said that Drawbaugh was the inventor, — the *inventor of the clock that would run perpetually.* Those articles were published far and wide, and attracted the attention of the editor of the *Baltimore American*, the leading newspaper in Baltimore. It was the famous reputation of Dan's clock that would run without winding that brought to Harrisburg Mr. Matthews. Drawbaugh explained it to him in detail. He took notes of the explanation, and afterwards, when he read that some other impostor in Massachusetts had invented perpetual motion by electricity, *that* led him to the publication of his article on Dan Drawbaugh's clock, for fear that the glory of this great discovery might depart from Pennsylvania, or from the Middle States, and be transferred to the East. So he wrote his article, in which he said that this contrivance, this almost perpetual motion, was not the invention of the man in Massachusetts, but was the invention of Drawbaugh; and gave Drawbaugh a column of the *Baltimore American* — one of the first newspapers in the South — in praise of this wonderful invention.

When Dan Drawbaugh was doing this thing he knew that that was a fraud; he knew that this clock was copied out of an encyclopædia, which he says he had away back in 1867, or about that time, and he names the encyclopædia, and gives the pages. We got that out of him on cross-examination; but some people who had been humbugged by him had found it out themselves. We got the book. It is a very familiar book —Tomlinson's Encyclopædia. It is a book that was published in 1852 and 1854, in two volumes, to illustrate the great Crystal Palace fair.

Mr. Hill. — This has not been opened, and I shall ask to reply. It is of no consequence, however.

Mr. Dickerson. — If it is of no consequence, then you will not want to reply. If it is of any consequence, I am quite willing that you should reply. The more you reply to it the more it will help us. If the Court will indulge you in a reply, it will indulge me by letting you reply, for I would like to hear you all the time.

A clock, as your Honor knows, is kept running by a weight. Take the weight away it will stop. When the weight runs down, it must be wound up. It requires very little power to run a clock. If it were not for the resistance of the air and the friction on the centre of suspension, a pendulum once started would swing forever. The clock weight wound up furnishes the little power that is necessary to keep the pendulum going. In place of that weight, a battery can be used to charge an electro-magnet, and, by attending to the battery once in a while, one can keep the clock going. The difficulty in using a battery, however, is that it never runs two seconds alike. A "*constant battery*" — that is, a battery that will develop a truly constant and uniform force — has been the dream of inventors ever since batteries were first made. If any man could invent a battery that would run uniformly, he would have a great fortune out of it. We have no constant battery. A battery runs with an ever-varying force. Sometimes there is less, sometimes more, according to circumstances; therefore a battery is of no practical use when applied to the running of a clock. A weight does the work exactly and causes the clock to run uniformly; and such a clock will keep uniform time so far as it depends upon the driving power. A clock run by a battery will not keep time. Drawbaugh induced Mr. Shapley to take an interest in this clock, and to build one. He was a clock maker. He testifies that the thing would vary fifteen minutes in a day from day to day. He did not know anything about electricity, and relying on Drawbaugh's representations, he became a victim and built a clock. It would vary fifteen minutes from day to day. Of course it would. It was like Capt. Cuttle's watch, — one of the best things in the world to keep time with; if you set it ahead ten minutes in the morning and twenty minutes at night, there was no better watch in the kingdom.

Now, I am going to show you from Tomlinson's Encyclopædia that Dan Drawbaugh knew all about it when he was doing this fraud and getting money for it. He knew all about the clock, and had it all in this book. Here is an accurate description of it in Tomlinson's Encyclopædia, p. 41, referred to in Drawbaugh's deposition (defts, ii, 968, 970, 976): —

"Mr. Bain, Mr. Appold and others have also produced various forms of electric clocks, in which the current from the voltaic or earth battery is made to supply the place of the spring or weight commonly used as the maintaining power. . . . The *earth battery as usually made* consists of a large plate of zinc, and either a plate of copper or a quantity of coke, buried at a certain distance asunder in damp earth. *The moisture of the earth acts on this voltaic couple as the exciting fluid*, and a feeble but very constant current is produced by this arrangement.

"In these and other ingenious applications of electro-magnetism as a maintaining power to clocks, the *attraction and repulsion* of magnets have been brought to bear directly on the pendulum, the bob of which is a coil of insulated wire, through which the electric fluid is transmitted at intervals. . . .

"On the applying electricity to produce the vibrations of the pendulum the *amount of power must be constantly varying with the variations of the battery, and it is of course impossible to obtain correet chronometrical results under such circumstances.*"

The book describes various kinds of electric clocks run with earth batteries, zinc, copper and carbon plates being put into the earth to make the pendulum swing. Of course all that has to be done is to put a magnet or an armature in connection with the pendulum, and then connect the electro-magnet in an electrical circuit with the battery; and when the pendulum swings one way it cuts the circuit and the current ceases to act; when it swings back the circuit is closed again. The battery is thus made to do the work of the weight. The pendulum makes and breaks the circuit, and the thing is done. The battery in place of the weight, to run the clock The whole thing is described in this book; and the reason why it will not keep time is stated.

Now there is where Drawbaugh got his electric clock, and at the same time that he got it, he learned that it would not keep time. There is where he saw and got his earth batteries, and the alternate attraction and *repulsion* by an electro-magnet. Having got these ideas from this book, what did he do? Here was a man struggling in poverty, according to the answer and the testimony. What did he do? He is a dabbler in just such things, — a fellow who wants to experiment in anything that comes around, rather than do a piece of work in a straightforward way. It suits his taste. He could afford it. He had a good deal of money. He was willing to spend his time and his money in tomfooleries of that kind. What did he do? Why, he goes to work making Bain's electric clocks.

In order to make a clock, he needed to have cog wheels cut. His neighbor and friend, Shapley, a clock maker, had a gear-cutting engine, and he borrowed it and used it; and there were perhaps fifty gear-cutting engines in Harrisburg. Drawbaugh, however, was not satisfied with using Shapley's gear-cutting engine, which he had, or with getting his gears cut for a few cents apiece in any shop, but he went to work to build a gear-cutting engine for himself for the purpose of cutting gears for his electric clock. He never built but five clocks; but, to cut his gears, he built himself, at his own expense, a gear-cutting engine. The fact is published for him by his friend Lloyd that he has made a gear-cutting engine, that cost him only from sixty to seventy dollars, whereas to buy a new one would have cost him some hundreds of dollars. This *pauper*, who did not know where to get bread from, who could not get the money necessary to patent the telephone, was seeking to put this fraud of a clock out on the community, — this clock that will run without winding; and he builds a gear-cutting machine to use in making the machinery of the clock. (Brief, p. 326.)

What next? He said that he wanted to see how this clock would keep time. Thereupon he constructed a transit instrument, to take the time from the sun. This is really laughable. He had some lenses, which had been in a photograph apparatus; and with them he went to work to build a transit; to construct a perfect instrument, capable of sweeping a true meridian plane. It would have cost him a great sum to do it, and if he could have got it done it would have been of no use *to him*. Even if he had had the great transit at Washington, it would have been of no more use to him than a buckwheat cake, in finding out what time it was. But he went to work and built this transit. What to do? Why, to find out how his clocks kept time. There was a great clock in the city of Harrisburg, within sight of him; and he was right alongside of the railroad, where he could obtain government time, even to the second. But he built a transit; and he says that every day for a long time he took a transit observation. He did this every day for a long time, and then every two or three days for a time. This is his testimony: —

"Them observations were continued, to the best of my knowledge, six or eight months, or perhaps one year" (complts, iv, 144).

He was asked: —

"*X Q.* 114. Can you give the name of the formula that it is known by?

"*A.* I cannot; but I can find out."

He was like the boy who was shown the first letter of the alphabet: "What is that, my boy?" "I don't know." "That is A." "Oh! is it? I knew the name, but I had forgotten it." Here was this charlatan, who had first built a gear-cutting engine with which to make gears for his electric clock, then built a transit for the purpose of seeing what time his clock kept, and then, when asked how he did it, how he turned his transit observations into time, he answered that he did not know, but "I can find out." (Brief p. 325.)

Then he went to Mr. Shapley, a watch and clock maker who lived in the village of Mechanicsburg, where Dan lived for a year, — from the first of April, 1876, to the first of April, 1877, — and got him to contract to buy Bain's clock. Shapley then had two thousand dollars of money, which he wanted to invest in something. Drawbaugh having impressed him with the idea that he was a man of profound genius, he was persuaded to enter into a contract, which is in the case, in writing, signed in November, 1876, to go in with him and patent his wonderful invention, the electric clock, — whose great merit was that it would run without winding. Shapley paid him twenty dollars, and then made a clock at his own expense. Shapley did not know anything about electricity, but he did know about clocks. He went to work and made one from Drawbaugh's specification, and set it up; but of course the thing would not run within fifteen minutes of any time. Shapley did not have a transit; he only had true time in his shop derived from Washington. Having no transit, he was not able to make this thing run within fifteen minutes one way or another of the true time. That settled the case with him. He did not want any more electric clock. Dan had stuck him for twenty dollars and the cost of a clock, and that was enough. Shapley was called as a witness. He gives a piece of testimony which is interesting. We also asked Dan about this affair, and if he and Shapley were on good terms. "Well," he says, "I don't think Shapley thinks as much of me as he did at one time." I should think not, after that performance. That was Drawbaugh's opinion. "I don't think Shapley thinks as much of me as he did at one time; by his manner when we meet, I would think he didn't think very much of me" (defts, ii, 1101). After a little experience with Dan, nobody does. One only needs to get close to him, and after that he experiences the feelings of Shapley, — the stronger the closer you get to him.

Then Dan went and talked of this wonderful invention to three other men. This second set were not clock makers, and knew but little about them, and so he interested the Grissingers in his electric clock, and Shettle, who was a relative or connection of his. He went to these people and sold this unpatented *invention* of a clock to them. This was in 1878. They paid him *five hundred dollars in cash for the inchoate right of patenting a clock which would run without winding, by an earth battery;* Dan Drawbaugh all the time having that book alongside of him, and knowing it was a simple fraud.* He worked up this electric clock and sold it to his neighbors, — he knowing all about it, they knowing nothing, — and he swindled them out of that five hunderd dollars. But what did he do with the money? Did he use it to apply for a patent on his telephone? We have been told of his distress of mind, of his perpetual agony, of his days and nights occupied in wandering about with down-bowed head, lamenting the hard fate which prevented his getting thirty dollars with which to patent his wonderful invention. Yet during all this time he was building these clocks at an expense of hundreds of dollars, and spending his time in squinting through that tube which he called a transit. He might just as well have squinted through that tin cup, for all the use it was to him. But he got this five hundred dollars. What did he do with it? *He paid off a mortgage.* That was the second time that he did that with money. He paid off a mortgage of $237 on a house which he had bought in 1876 and owned in Mechanicsburg. He paid off that mortgage of $237 with the money that he had made by swindling those people in selling them *as his invention* a clock that would run by an earth battery, and would not need winding.

---

* It was the prospect of controlling by patent a clock which would go without winding that attracted them. Shettle testified that there had never been any talk about patenting a telephone but (defts, i, 222): —

"*Q.* 56. Am I to understand that it was your judgment and belief that there was more money in a clock that would run without winding up, than in a machine by which a man could talk from one place to another?

"*A.* Yes, sir; I thought there was more money in the clock."

"*Ans.* 58. Persons all over the neighborhood were talking about the clock, thinking that it was a great invention, and that it would be worth a large amount of money."

"*X Ans.* 98. No, sir; the principle was to be controlled by a battery from the earth by itself."

"*X Ans.* 99. All those that were to be magnetic clocks were to run without springs or weights."

Is not that man an impostor? If he had never seen this encyclopædia,—if he did not know anything about it,—if he had gone into that piece of tomfoolery in his ignorance, I would have nothing to say about it. He is an ignorant man,— very ignorant. He is a good mechanic, — a good workman with his hands, but profoundly ignorant of principles. But he knew about this; he admitted on the witness stand that he knew about it. He gave us a reference to the book. He told us from where he got it, and when he got it; and that is what he did with that knowledge. (Defts, ii, 968, 970, 976.)

Well, he went on a little further. He carried that farce on a little further, and finally got a patent on his electric clock; and what do you think that patent was? He patented, as a "*new article of manufacture*," a galvanic battery for electrical clocks, with the two elements strapped together instead of being laid side by side without fastening, which was old, so that both can be put into the ground at once. He claimed that as "a new article of manufacture," — the two plates of a battery strapped together. He got a patent for that. That is what his invention was (defts, ii, 969–972).

The Court. — When was the patent applied for?

Mr. Dickerson. — In the spring of 1878. This is how it is described in the O. G. claim: —

Daniel Drawbaugh, 211,322, dated Jan. 14, 1879, *for earth batteries for electric clocks.*

I. "As a *new article of manufacture*, an earth battery or couple, composed of a copper and a zinc plate, both protected fixedly by enveloping bodies of coke and felt, respectively, or of equivalent substances applied by adhesives to said plates, *ready made for use*, in the manner and for the purpose substantially as set forth."

Mr. Hill. — The ground-battery patent was applied for by the Clock Company. It is not a patent on the clock at all.

Mr. Dickerson. — This company paid him $500, and then applied for a patent. That patent was not for the clock which he had sold the company, it was not for that that he applied for a patent in 1878; but his application was for a patent for a new article of manufacture, namely, two plates of a battery strapped together, — in place of being put into the ground, first one and then the other.

Mr. Hill. — That was an application for a ground-battery. He also applied for a patent for improvements in electrical clocks, and that application *is still pending. His assignees have not taken out that patent.*

Mr. Dickerson. — I should think not. Your Honor knows very well that any one can get forty patents on an electrical clock or anything else. He might put the battery crosswise or put the magnet upside-down, — this way or that way, or any other way, — and get a patent on it; but it was not the thing that he was telling the public about. He was telling the public that he had *invented* a clock which would *run without winding, by an earth battery*. That was it. That was what made them stare. Your Honor will remember that description of a friend of his in the Mechanicsburg *Journal* who published how his words rolled out, and how he talked of science in a way that would astonish a man. That reminded me of Goldsmith's description: —

> "While words of learned length and thund'ring sound
> Amazed the gazing rustics ranged around;
> And still they gazed, and still the wonder grew
> That one small head could carry all he knew."

Drawbaugh was there carrying on this game of making the rustics around him gape and stare at him because he had invented a perpetual-motion clock, and was squinting through a brass tube in front of his place, and talking gibberish.

But one thing more. He made, in consequence of this electric clock,—or whatever electrical apparatus he had,—he made a machine to wind the thread around the wires for insulation. He made a machine to do that. This wonderful inventor, whose whole heart and soul were in this telephone, was making a machine to wind thread on the wires. Now this insulated wire consists of simply thread and copper. He had got to buy the copper and the thread. He could buy insulated wire, for it is an article of manufacture, and is kept in all places where electrical supplies are kept; he could buy the insulated wire, I have no doubt, for as little as he would have to pay for the thread and the copper; because it is made by wholesale, by the ton, and it costs very little to wind the thread on the wire. And yet he must needs make a winding engine to wind the thread on the outside of his copper wire, at a cost far greater than all the wire he ever needed, and then have these country bumpkins stare at that, and tell about it in the record. This inventor, whose whole heart and soul were bent upon patenting the greatest invention of modern times, set himself to work to make a little winding engine in order to wind the thread upon the wire, when he could have gone into any supply store in Harrisburg, and for as little money as it cost him to buy the copper and thread separately, could buy the complete thing. But that would not have been occupying his time in making these jimcracks and amusing himself with imitating well-known machines.

That is what he did with the electrical clock. The end of it, as I am told, — and I hope I shall not offend anybody by saying it, — that that electrical clock belonging to Mr. Marcus Marx is now at the Electrical Exposition at Philadelphia. That clock, with its broad base, its carved front and entablature, and magnificent woodwork, is there on exhibition as "*Drawbaugh's Electrical Clock.*"

We will go a little further yet. What else was he doing? I will take you inside of that shop now. I agree with Mr. Edmunds, who said yesterday that the right way to look at this thing is as it then was, Let us look at it from that end of the line, and as it was at that time. in the environment in which it stood. That is honest and fair. Take an inside view of that shop. What was there? This Dan Drawbaugh, having this wonderful invention of the telephone on the brain, as they say, was making another instrument, which is called an electric key. That is the thing we had on the table, which you could put your finger on and snap, and make it ring a bell. He was making that electric key. That thing is very old. It is proved to be so. It is a perfectly familiar fact in electricity (complts, ii, 1381-2; brief, p. 322). It is here called the electric key. Move a permanent magnet in front of an electro-magnet, and that motion generates a current of electricity. It is a very old invention; and Drawbaugh was making it in his place. If one went in there he would see that. It was connected with wires and with bells. Dan was going to make that thing ring the bells in a hotel. But this was done, as you perceive, merely to save the necessity of having a battery in the cellar,—just as the electric clock would save the necessity of a man winding it up once in a while; but he would have to go and look after the battery occasionally. That is all. He had this all rigged up there, with the bells on it. He has described it in his deposition, and described it very well; and he has told us that he was going to make this electric key ring bells in different parts of the hotel — whichever bell he pleased. He was asked to describe that contrivance. That was a pretty dry problem for him. He scratched his head over it, and then said, "I can't hardly give you the right language; I know that I had worked them in that way; I had a mechanism, and I know I rung them, and it is so long ago I almost forget it." (Defts, ii, 982, x-ans. 1039.)

He said he had it in his head, but he could not describe it (defts, ii, 982, x-ans. 1039; 985, x-ans. 1050). No doubt he had it in his head, because it is a thing that anybody, if he was going to put several bells on one line, would like to have it in his head. Any one would like to know how to work that out. We asked him the question how it could be done, but he could not tell us. He claimed that he had done that thing there. That thing, however, looks very much like **C**. It is a big horseshoe magnet hung upon a trunnion, and the operator takes hold of one end of it and wabbles it. That thing looks just like **C** when it has its magnet on it. A countryman coming in there and seeing that, and then going away, and five or ten years afterwards coming as a witness, and being asked to tell what he saw, he would not know whether it was **C** or the electric key. That is what he had there.

What else did he have in that shop? He had in that shop a letter or alphabet telegraph, in which is touched a key like the key on a piano or on a writing machine, and each key which is touched represents a letter, and the impulse goes on the line and a letter is shown at the other end in a machine there. Each one of these keys had a little electro-magnet of its own. If he wanted to send A, he pressed down A, and that wabbled a magnet, and that sent a current on the wire to its end. Well, that is also a very old device, — very old. It came in thirty years ago sure. It is all proved in this case (complts, ii, 1382). All of these things that I am now telling you about are proved in this case. They were all old devices. They are shown and described in any handbook of telegraphy. We cannot say that he saw them in any particular handbook of telegraphy, but he might see them there. A man who did not know that those things were old, did not know anything about electricity. He not only did not have any knowledge of the current literature on the subject, but he was ignorant of principles, and therefore he had no capacity to make any such invention as this. But he says he invented it (defts, ii, 990).

He had this A B C telegraph in that place, and he told people that it would supersede the telegraph. He told them that the electric key would supersede the telegraph. He acted on that idea, and actually made experiments to see whether it would not, — all of which I will come to in due time. That is what he had in his shop. He had in his shop some other jiggermarigs, which I do not recall at this moment; but these were electrical things that were there, which he was exhibiting to people. They would come in, and he would say, "Here, do you see that?" Then he would wabble his magnet and the bells would ring. "Do you see this?" He would put his finger on a letter of the alphabet, and the letter A would tumble out yonder. He would spell out words with it. In place of telegraphing in such a way that one would have to learn the signals, as the Morse instrument requires, he claimed that he had a thing that he could spell the words out with, — a kind of talking machine. Press the keys at one end of it and the letters come out at the other and spell out the words. He was doing all these things there. He was spending hundreds of dollars in money and time, — as much money as would patent hundreds of telephones. He was working at these things for years. He had expensive apparatus, — very expensive, — a spelling-out telegraph is an expensive apparatus. He had to have the twenty-six letters worked by separate electro-magnets or by separate armatures, and have all those circuits completed; and it is a very expensive apparatus. He worked at this thing day after day, spending his time and his money upon it. He showed it to visitors, and now they come and say it was a "talking machine." We examined him about it, and his vanity was so tickled at the opportunity of having his immense learning exhibited that he became very effusive, and told all about the things on his cross-examination, not seeing where he was landing his case. My friend Mr. Smith led him along as softly as possible, and he told us all about these things, — described them all in very good language. He described how these electric toys were made, and how they operated, and how he made them all. There they are. On page 340 of our brief is a list of things which he had in his shop and pretends to have invented. Apart from the telephone in dispute, all were well known years before he touched them.

Now, may it please your Honor, all that was done by a man who all this time, *as they now say*, was trying to get $15 or $30 for the purpose of patenting a telephone which he claimed to have invented. In all the time that he was imposing on that community by these devices and contrivances, — by this brass tube, or whatever it was that he had to look at the sun through, — and by all these sorts of things, and while he was getting himself notorious in newspapers, and looked upon as a man of immense capacity in that community, he also claims to have invented a lot of other things, one of which was a modification of an old molasses spigot, in which he got his neighbors interested, and lost an immense amount of money for them. Now it is because of all these things that I say he was a "professional impostor"; that he was carrying it on as a business regularly, and that he made a great deal of money out of it. He got more money by putting out insignificant things upon his neighbors, and getting their money for them, than he could have earned as a mechanic if he had worked every day from morning to night at full wages. He got more than $10,000 in cash for such things as he had contrived. I will give you an illustration: —

One of his companies failed in trying to manufacture some of his things. They were good for nothing, and he could not make them good for anything. Still, the company had not lost faith in him, and they were looking about for something else from him that they might take up and make something out of, as they probably hoped. Mr. Dorsheimer happened to come down from Buffalo, and the people who were Dan's partners, — respectable people there, for Mr. Dorsheimer associated with them, — were told by Mr. Dorsheimer that in Buffalo there was a concern making money out of manufacturing wood screws. Your Honor may know that this wood-screw business has been a very profitable and extensive business, and that it is founded upon some very valuable patents. The Providence concern, which has been going for thirty years, has made a great deal of money out of wood screws. There have been a great many patents taken out upon machinery for making wood screws, and different companies around the country have been manufacturing them. Mr. Dorsheimer came down there and said, "Up in Buffalo there is money being made on wood screws." Dan Drawbaugh spoke up at once and said, "I can invent a machine for making wood screws." He could do anything, — it did not make any difference what: "I can *invent* a machine for making wood screws."

He had his company about him there, and so there was a meeting of the whole of them called, — a meeting of the people who had put thirty thousand dollars into the business for the purpose of carrying his inventions along. He said to them, "I can *invent* a machine for making wood screws." Thereupon, on motion of Rupp, seconded by Daniel Drawbaugh (for this is upon the minutes), it was resolved that Daniel Drawbaugh be requested to invent a machine for making screws for the use of this company. "For the use of this company." I notice in Mr. Hill's brief that he quotes the words "for the use of this company," and puts them in italics, and asks the question, "What has that to do with the telephone?" One of the questions asked Rupp was, "What did you mean by that?" "Why, to go into the manufacture of wood screws." That is the character of the man. He would invent a machine for wood screws, or a molasses spigot, or anything wanted, if you only told him what it was (brief, pp. 249–254).

This man had a most wonderful persuasive power with these people. He made them believe in him. If he told them that he would do anything, they would believe it; because he was a man of such excessive modesty that what he *did not claim, proved what he could do* (brief, pp. 249–253, 378).

But we go a little further. When he appears on this stage, and in this case, and attempts to carry out his impositions in this court, his talents develop wonderfully. He becomes a magnificent performer on that kind of instrument, when this court is the objective point. And that brings me to a very important story in this case, touching a great many witnesses, and a big part of this history. I will tell that story circumstantially, in order that I may tell it with accuracy.

A man named Thomas Draper had formerly lived up in that neighborhood and owned real estate there. He had been, I believe, a land surveyor. He had moved from there to Dover, Delaware, where he was engaged in manufacturing fertilizers, or something of that sort. He still kept his real estate (which was in farms) up in that neighborhood, and had an interest all the time near Harrisburg. He was up there in the winter of 1881, when this testimony was being taken, and was talking to people about this controversy which was raging. It raged in hotels, in blacksmith shops, in groceries, in public places, and in private houses, — the whole country was raging over this wonderful lawsuit, which was to let a flood of gold down into that little hamlet, and make the town thereafter richer than the "dreams of avarice." Every village gossip was engaged with it. It was talked all over. Mr. Draper went up there, and he got to talking about it. He said, "Why, I know something about this business." Perhaps he stated what he knew. But it came to our ears that he knew something about it. Thereupon Mr. Storrow sent down one of his agents to see Mr. Thomas Draper at his home, in Dover, Delaware. That was in January, 1882. Mr. Draper told that man that he had seen a talking machine of Drawbaugh's in 1873. That was a very interesting fact. It was the first piece of testimony that we came across that *apparently* had any bottom in it. Here was a man who was, to a certain extent, engaged in business there, — a fairly intelligent man, — and we accidentally heard that he had been up there, and had gone home, and that he had these impressions; and so we followed that right up. We wanted to know just what he knew about it. He said, "Yes, I remember about it; it was in 1873." That was very startling. But he said to our agent that Kissinger knew exactly, and we had better go and see him, — *that Kissinger knew exactly.*

Now Kissinger was the tenant on Draper's farm at a place called Marysville, and had become a tenant on that farm in 1874. Draper was mistaken about the time that this man had become his tenant. He had become his tenant in 1874, not in 1873. He told us to go and see him; that he knew all about it. This man Kissinger had moved away from that country, and was living in Maryland. Our agent went out from the presence of Draper directly to Kissinger, according to Draper's suggestion. Kissinger said, "Yes; I know all about that. The time that this ram was put in on my farm was 1878. I know all about it. I *think* it was in 1878." He had no reasonable doubt about it. That was a great relief to us, as your Honor may suppose; for if we had turned up a man like Draper, who knew of this thing in 1873, it was rather startling to us. For your Honor must perceive now, that, during all this time, this $5,000,000 company was selling its chromos around Wall Street, and it was not a very difficult thing to own it, if they had anything to sell. Our people, of course, would not have had much difficulty in owning the menagerie, if there was anything in it worth owning. It was very important to us to know whether there was anything worth owning, and if so what the thing was. It was important for us to know if there was really any bottom to the defendants' case. If any witness turned up who really knew anything of any value, we wanted to know all about it. It was vital to us to know. So we went to Kissinger, and he said, "Why, it was in 1878." That was a great relief. There was no such man as Draper any longer. He was not in the problem at all.

But, after our visit, Draper wrote a letter up to Drawbaugh, which letter has been read to you, in which he says that he does not want to see Dan lose his rights; but he does not want to become a witness unless necessary: and he tells Drawbaugh about the interview of our agent with him. That letter was dated somewhere the last of January, 1882, after our agent's visit. *The examination was going on then, and Dan Drawbaugh was on the stand.*

Just there comes in one of those lovely little incidents which show that the good God does not leave truth always at the mercy of knaves. A question had been raised about Drawbaugh's selling rams. We had been probing into Drawbaugh's business all around. This "*miserable poverty*" pretence was vital to their case; we were trying to get at the bottom of that, and we were probing into all his business matters. Among other things, in the course of his business, he was a manufacturer of hydraulic rams. We were getting at the ram business. We asked him whether he had not got accounts and bills about his rams that he sold, and the pipes, etc. He said that he had. We told him to fetch them along; that we wanted to see all. We were of course feeling in the dark. Drawbaugh came up and put into the case a bill for pipes bought to be used on a ram in Marysville. *That is the Kissinger ram. That bill was from the Philadelphia manufacturers of pipes, and was dated July*, 1878. *Drawbaugh put it into the case as exhibiting his ram business* (defts, ii, 1055, x 1427; p. 1068, x 12, 88). The value of that bill, of course, was not at all perceived by him or by us at the moment. It went in and became an exhibit. Drawbaugh had bought for Kissinger's ram a lot of iron pipes from the manufacturers in Philadelphia in July, 1878.

Mr. Draper wrote to Drawbaugh, and Drawbaugh received his letter, and then this is what happened: A recess was taken in the examination from the last day of January until the 13th of February, — a couple of weeks. Dan Drawbaugh and his partner, Jacobs, immediately started down to see Mr. Draper, who was a very important witness for them. Mr. Draper told them, probably, the same story that he had told us, and told them that Kissinger, his tenant, knew all about it. Thereupon they followed on our tracks, and went right down to see Kissinger in Maryland. Kissinger was an old friend of Drawbaugh's. All his sympathies were with him. He had lived as his neighbor, in Milltown Village, before he moved on to the Marysville farm, and was most kindly disposed towards him. So Drawbaugh and his partner, Jacobs, went down to see Kissinger, under the indication of Draper that Kissinger was the person who could tell them exactly what the fact was. What happened there? Kissinger told them that he believed that it was in 1878. Did he have any books or papers, they asked him. He said he didn't know, but would hunt. *He told the partners so, — Drawbaugh and Jacobs,* — two of the partners in this quartette. Kissinger says he told them so, and that he would look up his books and papers and let them know in the morning (complts, i, 559–60). It seems that the train that they were to go by passed Kissinger's place, and that these people had to get into the train some little distance off, and that they expected to go past Kissinger's place perhaps without stopping, or at any rate without a chance to talk with Kissinger. Thereupon Kissinger wrote upon a piece of paper the result of his examination, and took it to the train in the morning; not expecting to have a chance to talk to them, but would give them the information in writing. The train, however, stopped long enough for Drawbaugh to get out, and there Kissinger gave him the memorandum and told him about it. He told him to go to the railroad office at Marysville, *and there he would find the time when the pipes for that ram came.* They came from Philadelphia, and there was a bill of lading at the station. By that he could find it all out, and it was 1878. This visit was Feb. 7, 1882 (complts, i, 586).

I will supplement that by this statement: *Dan Drawbaugh made that ram, sold that ram, and put it up.* HE MADE IT, AND SOLD IT, AND PUT IT UP. He knew just when it was made, sold and put up. He knew that himself. He had done it. But they went to Kissinger, and Kissinger said it was in 1878. You observe that Draper had said in his letter to us that it was in 1873. He afterwards said that he thought it was 1874. We will get his history afterwards. It was pretty good luck to get a man like Draper to go back to 1873 with the telephone.

How that ram came to be associated with the telephone was this: when Draper agreed to buy the ram for his tenant, Kissinger and Draper went over to Dan Drawbaugh's shop to order the ram; and Draper was there that once, and never again. Therefore, whatever he did see he saw then, and not at another time. If it was in 1873, it was a very important fact for the partners. If it was in 1877, it was equally important to us, because Draper describes just what he saw. That it was in 1877 when Draper went there is what we show exactly; and Draper proves our case *exactly.* It was therefore vital to the case of the partners to support Draper, who said the visit was in 1874. Draper said that the ram was put in the year after it was ordered, not later; and so the date when it was put in became important, and they undertook to swear the ram in in 1876. That was their issue,— in 1875, or 1876, or some time before the Bell patent, it did not make any difference just when. They were not particular about the time, so long as it was before our dates. Dan Drawbaugh knew the time himself. He had made the ram. He had put it in. He had made out his bill for it. *That bill is in his hands to-day, and we have not been able to get it out of his hands* (defts, iii, 930, ans. 27). What did they do? The partners knew the truth so well that they did not even go to the railroad office where Kissinger had sent them, but they went on to examine Drawbaugh, and DID NOT ASK HIM FOR THE DATE. When they resumed the examination of Dan, beginning on the 13th of February, they did so with the knowledge that that ram question was the point that was coming on next in Draper's testimony, and with the knowledge that Dan knew the truth, for *he did it, and no one else*, and they never said "ram" once to him.

They then put Thomas Draper on the stand. Thomas Draper told his story, and he fixed the date of Kissinger's tenancy by the lease. Kissinger went there in 1874 and stayed till 1880; and Draper said that the next year after he went there he ordered the ram, which was put in by Kissinger. He said that it was put in not later than the next year after it was ordered. Some time was occupied in boring wooden pipes. Drawbaugh and his partners sat there and heard Draper tell that story, *when they knew what the fact was.* He made the ram, and put it in with his own hands. The coming issue was known to him before his testimony was closed; but he kept on the weather side of the law, as, you will find from his examination, he tried to do always. He is a shrewd man, and he keeps on the weather side of the law just as far as he can, and does not do any more swearing than he thinks is absolutely necessary for his case. He does not waste any swearing. Some of his people are wasteful liars. He is not; he keeps up to the edge all the time, but don't waste any swearing; he did not waste any on that ram. He is very shrewd. The moment that question came out, Drawbaugh perceived that the date when that ram was put in was a vital question; because if they could have established by one witness of character, and under such circumstances as that, the existence of those things in 1874, why they had given a foundation for Drawbaugh's whole story. It would not have proved that he had got a perfected invention, but it would have given a *foundation* for his story. It was worth immense things to them. They lavished money and time upon that issue until they swore, as appears by this record, — I do not know how many witnesses, — seventy-five to one hundred. What did we do? We called the Kissingers; we produced the railroad receipts; we showed that the ram was put in in 1878; we showed that Drawbaugh put it in himself; we produced the man who went for him in the wagon, and who took him over there to put it in. We proved it all as well as it could be proved. Then the partners attacked it. Now, sir, Dan Drawbaugh got thirty witnesses to go upon that stand and swear that they saw that ram in that place before 1878; that they saw it themselves, with their own eyes, or heard it beat with their own ears, or drank with their own mouths the water that came out of the spout that it supplied; and of those thirty witnesses there were a great many — more than ten — who never had been there after 1877, and therefore, it was said, could not have been mistaken. And among that number were as honest men as ever were witnesses in this case or in any other. Dan Drawbaugh himself, knowing the fact, having made the ram, sold it and put it in, and having the entry of it in his books, procured thirty men to come and swear that it was put in there before 1877, and that they had seen it, when he himself would not say so, and, of course, they never asked him. It was a vital issue, and they did not call him.

The COURT. —Where is the place in the record in which reference is made to the bill for the material used?

Mr. STORROW. — At p. 1068 of defendants' record, Vol. II., and complts, i, 554.

It was put in evidence in February, 1882. This is the bill: —

"Philadelphia, 7, 1, 1878, Mr. Daniel Drawbaugh, Eberly's Mills, Cumb. Co. Pa. Bought of Morris, Tasker & Co., Limited.
Mkd Marysville, Pa.

2 Bdles ½ Pipe 200,		.07	14.00	
165 lbs.	55 per cent & 2 per cent,		7.82	6.18"

P. R. R.

The COURT. — How is that connected with Kissinger?

Mr. DICKERSON. — I will show your Honor. The second of these accounts is the one: —

"Philadelphia, 7, 1, 1878, Mr. Daniel Drawbaugh, Eberly's Mills, Cumb. Co., Pa. Bought of Morris, Tasker & Co., Limited. Mkd. *Marysville*, Pa." — so many pounds of pipe — so much money.

You will notice that that second one is marked "*Marysville.*"

Mr. HILL. — *There is no doubt but that it does relate to that particular ram.*

Mr. DICKERSON. — I should say so!

Mr. HILL. — The only question is whether it relates to the original putting in of the ram or to the repairing of the ram.

Mr. DICKERSON. — Oh, ho! We are not commenting upon that just now. I want to get all the facts in first. I do not propose to be taken out of my order by any admissions.

The COURT. — Is there any issue about that in this case?

Mr. DICKERSON. — No, sir; *there is no such issue. There is not a witness who has said that there were two sets of pipes put in there, or that the ram was put in there twice.* There is no witness on the record who has offered to state that. That is a clear fabrication or suggestion in this brief. They have got a few of their witnesses to say that they *heard it said that there had been a set of pipes taken out and others put in.* That is about all that these witnesses attempt to say. They merely say that they have heard that the original set of pipes has been taken out and a new set put in.

Mr. HILL. — That is discussed in the appendix to our brief; and I do not want to argue the question.

The COURT. — I did not think that it had been discussed.

Mr. DICKERSON. — It was one of the best things in the world for them not to discuss.

Mr. HILL. — We did not want to take up the time with it.

Mr. DICKERSON. — I know you did not; and you did not discuss a great many other things that belong to this case, but occupied your time in abusing us. If you had only discussed your case, you would have saved me the trouble of doing it.

Now let me state that issue again. Let us have no mistake.

This suggestion is made in the brief for the first time, that possibly the explanation of this contradiction is that this ram had been put in twice, and that the pipes have been put in twice; or that the ram was put in first, and that then it was taken out again, and carted back to Drawbaugh, and that he did something to it, and then it was carted back and put in a second time; or that, perhaps, the first set of pipes was dug up and that a second set of pipes was put in the second time. But all that is nothing but the suggestion of the partners. There is not a witness in the case who swears to any such thing. Dan Drawbaugh knows whether it happened or not; because, if it did happen, he did it. Mr. Draper knows whether it happened or not; because, if it was done, he paid for it. It was his ram; he bought it; he paid for it. It was on his farm. I heard somebody tell your Honor yesterday that here was Mr. Kissinger, a very poor man, who had to look out for a lot of cheap pipes before he could have them put in. Why, sir, he was not paying for them. They were paid for by his landlord, Draper. The landlord paid for them, not the tenant. Whatever the tenant did, he got credit for doing on his rent account. They were paid for by the landlord. Now Dan Drawbaugh knows whether this is true or not. Thomas Draper knows whether it is true or not. Thomas Draper says to us, "*I am satisfied that the ram was put in in* 1878."

Mr. Hill.— And he says, in the same breath, that he is satisfied that the visit to order it was in 1874, just as he said originally.

Mr. Dickerson. — You will hear a good deal from me if you don't keep quiet, and it will be bad enough for you anyhow when I am done. I will give you the testimony before I get through, but I don't want to do it in advance. One issue was as to when Mr. Draper saw Dan's talking machine. He says that he saw it when he went to Drawbaugh's shop to order the ram, which, *he says*, was in 1874. He also says that the ram was put in not later than the next year. Then they undertook to support that latter statement substantially; they undertook to prove that the ram was put in in 1875-6. They made an independent issue on that. They proved that better than any fact is attempted to be proved in regard to the talking telephone. They prove it by thirty witnesses who saw it, and could not be mistaken. It is better proved than anything about that telephone. It is a case which is well for the other side not to discuss. It ended by Draper's saying, "I am now satisfied that it was not put in until 1878." That is the testimony of their principal witness, and of the owner of this property on which the ram was put. Then Drawbaugh's partner stands up and tells your Honor, "Oh, yes! but Draper, while he gives up the fact that the ram was put in there in 1878, yet we have thirty witnesses to prove that it was put there in 1876; and he says that he ordered it in 1874."

That is a different question.

Mr. HILL. — It was a different question; there is no doubt about that.

Mr. DICKERSON. — I will not follow it up now by reading the testimony. Draper said at first that he ordered it in 1874, and the way he knew it was by the lease, and by the fact that he was going to put a ram in there for his tenant, but which ram was not put in until the next year. It was ordered in 1874, and put in in 1875. That was the issue. It was necessary to prove by Draper that it was put in there in 1875 or 1876.

The COURT. — Was the bill of Drawbaugh's for putting it in produced?

Mr. DICKERSON. — No, sir; the other side have got it; and it was never produced.

Mr. HILL. —The bill was sent for collection in 1877.

Mr. DICKERSON. — He says that the bill was sent for collection in 1877. *It was handed back to Drawbaugh, but Drawbaugh does not produce it.* A witness first said that he had that bill in 1877, and handed it back to Drawbaugh; but he has corrected his dates for us (defts, iii, 930; complts, iii, 2331). *But they do not produce that bill. Drawbaugh put the ram in.* He *made it. He sold it and put it in, and made a bill for it.* That bill he has got. It is in his desk. Then his partner stands up here and tells your Honor that the bill was made in *1877; but where is the bill?* This issue, as you see, is a very heavy issue. It is as big an issue as there is in this case. It is an enormous issue. Drawbaugh, knowing all the facts, deliberately got thirty men to swear falsely, of whom half a dozen or more came back to the stand to correct their testimony, and showed how they were mistaken. They were highly respectable people. That date is better proved than the talking machine is proved. It is proved by witnesses who associate in their minds certain events, about which there is no mistake, and which, by logical connection, lead them as to the supposed date. This is what then happened: When this issue was made, it did not occur to these sagacious gentlemen to say, "Oh, yes! Draper is mistaken; he ordered the ram in 1874; but it was not put in until 1878. Four years elapsed between the two events. He is simply mistaken in saying that it was put in the next year." It did not occur to the sagacious gentlemen in this quartette who were working up this case to take that view. We were afraid they would. It occurred to them to take the other view. They decided to support Draper by proving that it was done in 1876. They could have taken either view equally well. They called their thirty witnesses to sustain him. If anything is proved by human testimony, it is that that ram was put in there in 1875 or 1876; and the fact is sworn to by an unlimited number of persons who went there and saw it, and could not be mistaken about it. They support Draper by a great mass of testimony. Then presently the whole fabrication broke down, and was crushed. Draper came to the stand and said that he must have been mistaken, that "it was not put there, as I said, in 1875 or 1876; it was not put there until 1878." Draper's wife was called. Draper's daughter was called. There were the men and the women who had lived in the house, — Kissinger and his family, and Draper's agent, who attended to the business for him; and all these people were called as witnesses; and by them the date was fixed beyond the possibility of a doubt. Their evidence settled that it was put in there in 1878; and Draper swore that it was so. Then Draper said, "True it is that that was not put in there until 1878, but, all the same, I had that conversation in 1874." That is another question. I am not talking about that. What I am showing is that Dan Drawbaugh tried to establish by the testimony of thirty witnesses what is a falsehood, *and what he knew to be such*, to wit, the date when the ram was put in; because he himself did that thing which he was calling witnesses to prove was done, and when he had the bills in his pocket, and knew all about it, and when he went to those witnesses and got them to commit that false swearing, — I do not say perjury as to all, — for he got half a dozen of them, as respectable men as there are in that neighborhood, to do it, who afterwards came back to correct their testimony.

Among other things that happened, the ram was walled up. It has to be walled up. A ram is buried in the ground, to be below the frost. It is put in a well, and the sides walled up by masonry. Then, at any time when they want to take the ram out, they just uncouple it and lift it out. It is merely a pit in which the ram is, covered with a board cover; and in the country they put corn husks or what not on it to keep it warm. The mason who stoned the ram up was produced, and he produced his books, with the record of the day when, and the amount of money for which, he did that work; he testified, "I stoned that ram up, and here are my books; the entry is, 'George Kissinger, 1878, Nov. 6, half day at ram,' and I was paid by Kissinger, and so on" — here it is. The next-door neighbor, a very respectable man, who was called yesterday by Dan's partner a very old and decrepit man, was one of their strongest witnesses; because he is a man of character, a man who would be believed anywhere in that community, and he swore that he saw that ram in 1876, — I think it was 1876; and among other things which he has told us was that he saw Wagner, the stonemason, walling it up.

Mr. Hill. — Will you please refer to the testimony where he says anything of that kind? I think you don't know very much about the testimony that you are commenting upon.

Mr. Dickerson. — Maybe I don't; but if I do not, it is because of my unfortunate stupidity. I have worked hard enough.

I said that this witness, Mr. Cowens, said that he saw the stonemason walling it up, and I am told that that is not true, and that I don't know anything about the testimony.

Mr. Hill. — You said that he said *he saw him walling it up in 1876*. That is what I said.

Mr. Dickerson. — Now let me read the testimony.

Mr. Hill. — If I am mistaken, I want to be corrected.

Mr. Dickerson. — No, you don't want to be corrected. In that deposition he, the friend and next-door neighbor, testified as follows (complts, iii, 2148): —

"*Q.* 3. . . . *The first time* that you ever saw that ram, was anybody doing any work about it; and if so, who, and what was he doing?

"*A.* MR. JESSE WAGNER WAS WALLING UP THE PIT WHERE IT SET IN, WHEN I FIRST SAW IT."

Now, for a man ignorant of the testimony, as I am, that is a pretty good hit. And for a man who took the testimony and examined the witness to stand up and tell me I lied —

Mr. HILL. — I didn't say you lied. I only asked you to show me the testimony.

Mr. DICKERSON. — I have not got the reporter's notes by me, and I am going to stick to my memory upon it. I noticed that Mr. Hill said to your Honor yesterday that Mr. Cowens had said that Wagner *told him that he walled it up, — told him — not that he saw Wagner do it, but Wagner told him.* I had it in my mind then, and when I went home I looked at it, for I knew it was not so; I knew Cowens was the man who fixed the time by the circumstance that he *saw Wagner, the mason, walling it up.* Wagner swears "it was walled up in November, 1878, Nov. 6; here are my books of account." Thereupon Mr. Cowens says, "If that is so, — and I believe those books, — if that is so, then my association is mistaken."

Now, when I am on Mr. Cowens's testimony, I will give you the history of that, because it is an instructive illustration of how the human mind is deluded by false associations. Here is the case of a man who, in 1875, was going to put up an aqueduct on his place. Cowens wanted to lead water from a spring to his house, and he put in an aqueduct, — square pipes made of four boards nailed together and buried in the ground. When he came to think about the time that his neighbor was putting in his ram, he thought it was the time when he was putting in that aqueduct, and that then he went over for the purpose of seeing what his neighbor was doing, in order to get the benefit of his experience, as they were both engaged in the same kind of business, — putting in an aqueduct. He went over there, and he saw pipes being got ready for that ram. That is a first-rate association, — and his motive for going there was the true one.

Now what was the fact? Roots of trees had grown into Cowens's square box, and filled it up, and in 1878 it had become choked up and worthless. He then had to do something to repair that aqueduct; and *then* he heard that his neighbor had been boring logs for an aqueduct; and *then* he went to see about it: it was the second time that he was attending to his own aqueduct and not the first time. Yet his mind was very certain that it was the first time. There was an association at each time with a similar event; but the difference was simply one of two years in time. Of one fact, however, he was sure: "I know that I saw Wagner walling it up when it was first put in." Of course, if that was so, then he knows it was the second time and not the first time he worked on his own pipes that he went there. And that was this *so-called* miserable, decrepit old man, Mr. Cowens, whom they described to you yesterday as having been led by us into taking back what was true in consequence of our telling him that the mason had made a *misrepresentation*, and he yielded to that representation, which of itself was false.

Now, sir, let us have no doubt, because this I consider immensely important; for, if the question to be proved in this case was dependent upon the fact that that ram had been put in in 1876, in place of 1878, it has been proved better than anything has been proved about talking machines; and it has been proved by the men who procured the testimony, who knew it was false when they procured it. I am not now troubling myself about the value of the fact; I am only concerned about the value of the kind of testimony these people can get and put into this record, about anything they choose to turn their attention to.

Now, sir, in connection with that affair, there is a man named Eppler, who was appointed the agent of Mr. Draper in the spring of 1877 by a power of attorney, which is in evidence. Up to that time Eppler had been engaged on the railroad. He then became a storekeeper in Marysville; quit his outdoor business and came into town and had a shoe store. Mr. Draper appointed him his agent in the spring of 1877, before this ram was put in. Kissinger had been a tenant of Draper's from 1874, and they had been talking backwards and forwards about getting the ram in there.

The tenant was very poor pay, and the landlord was somewhat exacting about his money, — not unduly so, — but there had been talk about it, and would not Mr. Draper put the ram in there? The spring that supplied the house was five hundred feet away from the house, and the women had to go that distance to get the water supply. It had been questioned whether Kissinger would not have it done. If he did, he would have got credit for it on his rent. Here is a letter written by Draper, Dec. 18, 1877, to his agent, who had been appointed in the spring of 1877 (complts, iii, 2178) :—

"MAGNOLIA, Decm 18, 1877.

"MR. HERMAN EPPLER Dear Sir Enclosed I return the agreement for Kissinger with the stock claus intirely left out. the understanding between him and me was, that I was to find one half the young stock and one half the corn to feed them. My only object was to feed the grain on the farm so as to improve it. But if Kissinger don't like that all right with me, and if He wont sign this agreement, He can stay under the old agreement and pay a certain Rint, and if he don't like that, I think the farm can be Rented to Esqr. Foulk's son-in-law Mr. Wallace. *Kissinger could pay all his Rents in improvements if he would.* THE RAM TO THROW UP THE WATER HE WAS TO PUT IN AND THE BARN WANTS REPAIRING. There needs a back Poarch & Smokehouse and Privy. He could haul the stone do the carpenter work, and change around so as to have but little money to pay, but I must have my rents in some way. I can't aford to keep the property and get nothing for it. I think I am as easy satisfied as anybody could be but must have my rents somehow. Write to me at once, and let me here what he does. Ever truly

"THOMAS DRAPER."

Now that letter was written in the end of 1877 to his agent, calling Kissinger to account for his neglect, who could have put in this ram and had not done it, and could have built those buildings and had not done it; and could have done this, that and the other, and has not done it. "I must have my money, or I must have him do the things which come to be the representative of that money." That was written to his agent in 1877. *A copy of that letter was in the hands of Drawbaugh's partners, before they put any of those witnesses on the stand to prove that that ram was there in* 1876. They had that letter in their hands before they put any of those witnesses on the stand; they had Draper in writing fixing the date 1878, before they ever called a witness to prove that it was there before that letter was written, and more than a year before.

Mr. HILL — What is your authority for that?

Mr. DICKERSON. — You may feel pretty sure that when I say anything I know it is so. Now I will nail that for your information, because *it is an awful thing;* and I don't make statements that are awful, unless I know that they are true.

The COURT. — I hardly think it is worth while to waste time in such detail. Of course I will have to search the record for myself.

Mr. Dickerson. — I want to impress those things now, because that disposes of so much of the testimony.

The Court. — In controversies of this sort there are always some salient facts. This case will undoubtedly turn upon very few considerations.

Mr. Dickerson — Yes, I think so. One of the facts here was that a man like Thomas Draper swore to that thing in 1874; and that is the only piece of testimony in the whole case that is worth a rush on the part of these defendants.

Now, sir, I think I have shown that Daniel Drawbaugh, in place of being that highly virtuous and honorable man whose testimony was to be taken without doubt or question, is an impostor; that he has deliberately imposed upon the Court by procuring testimony that is now admitted by Mr. Draper and the rest to be untrue in fact in respect to this very ram. It was evidently a point for them to establish; because, if Draper was right, then they have a case made in which Dan had two or three instruments before 1876 — vitally essential. It is the best testimony there is in the whole record, — he is the best witness.

The testimony of these thirty witnesses was begun in October, 1883, — that whole testimony that I have been commenting upon,— those thirty witnesses or more. I now read a document produced by the Dan's partner, Mr. Hill (complts, iii, 2287): —

"Baltimore, Md., June 27, 1883.

"J. J. Storrow, Esq.,
40 State St., Boston, Mass.:

"*Dear Sir*, — Please permit Lysander Hill, Esq., to see and take copies of all the papers and the book which you and Mr. J. C. Comfort obtained from me during the past six months.

"H. J. Eppler."

Eppler was the agent of Draper, and had this letter and these books in his possession, and had given them to Mr. Storrow. The other side wanted to see them, and Mr. Eppler gave that order on the 27th of June, 1883. Then the record says: —

"Complainants' counsel states that the week after the date of that order, respondents' counsel, Mr. Hill, came to him and said that Mr. Eppler had told him that complainants' counsel had some letters and papers, which they had received from Eppler, relating to the Draper farm, and that he desired to see them; whereupon the same were shown to him, and copies taken. The papers so shown were nineteen letters, the Draper-Eppler power of attorney of March 8. 1877, and the Draper-Kissinger agreement of Dec. 4, 1877. Said nineteen letters include all the Draper letters put in evidence in this deposition."

Now, sir, within a week after June 27, 1883, Mr. Storrow handed to Mr. Hill those letters, — those letters now that we are talking about, — this one. That was some months before they called a witness to prove that the statement of that letter was false. Have I answered you, sir?

Mr. HILL. — I misunderstood you; I thought you said we had seen these letters *before you had seen them. I saw them in your hands, the hands of your counsel.*

Mr. DICKERSON. — I said, as plain as the English language could be, that before you called and examined those witnesses you had that letter which showed that that testimony was false; and you challenged me to produce the evidence of that, and I produced it. Are you answered?

Mr. HILL. — I misunderstood your statement.

Mr. DICKERSON. — Oh! you misunderstood it, did you? Well, the Court did not, and nobody else in the room did.

Mr. HILL. — Then it was my misfortune. I thought you charged me with having access to those letters before you did.

Mr. DICKERSON. — *I charged you with having those letters in your hand when you called those witnesses; and you did.* You had them for months before you called those witnesses; and then you deliberately called those witnesses to swear to what was false, and what that letter showed was false.

Mr. HILL. — I think the evidence will show about that.

Mr. DICKERSON. — Now you had better not ask me any more questions.

Mr. STORROW. — This matter of the ram is referred to in our brief proper (pp. 525–531), and again in the appendix it is referred to more at length (pp. 781 *et seq.*). A somewhat similar issue arose about the alleged carrying away of bridges in the Yellowbreeches Creek; that is considered in the brief, p. 531; app, p. 752.

[*Adjourned to Oct.* 2, 1884.]

MR. DICKERSON. — My object in what I have said about the Draper affair and the ram is simply to show that these partners have been able to get thirty witnesses to swear falsely when they thought that the exigencies of their cause required it, — I might say have found many men in that county to *believe* falsely and then swear accordingly.

I said to your Honor, I think, that, notwithstanding the disassociation of the erroneous date of that ram, Mr. Draper, the witness, still insisted that his original visit to Drawbaugh had been in 1874; but he gave up his first statement that it was the year before the ram was put in. I read his letter to Mr. Storrow (defts, iv, surrejoinder, 253): —

"DOVER, DEL., May 1, 1884.

. . . "I could have shown you a letter that would have convinced you in a moment that I was correct in my statement [as to date of visit]. *But I could not get the consent of my mind that that would be doing right, nor have I ever shown it to the company, or let them know that I had it. I wish I did know who is right. I am convinced now that I was mistaken about the time the ram was put in.* I FEEL SURE THAT IT WAS NOT PUT IN UNTIL 1878. Every truly,

"THOMAS DRAPER.

"I may possibly be up next week."

That letter, of course, was very much objected to by Mr. Hill. In that same connection, your Honor will see, if you read it (I will state it), that at once we instructed our agents not to go near Mr. Draper, not to see him or communicate with him, or in any way to bring ourselves in contact with him, until the other side had got that information from him which he *did not wish to communicate to them* — his *conscience* being in the way a little. We supposed that was another trap (for there were a great many set for us in this case), like the Kahney business. Therefore we never went to see Mr. Draper, nor had our agents see him, nor communicate with him — no doubt to his disgust — until the other side put him on the stand; and then this letter came out.

There were just three people in the world who knew *for sure* about that ram: Dan Drawbaugh, *the man who made it and put it up*; Draper, the man who paid for it; and Kissinger, the man on whose farm it was put. We have Draper and Kissinger. *Drawbaugh* *does not appear;* his partner said to you in this room, "WHAT CHEEK TO ASK US TO PRODUCE DRAWBAUGH!" It would have required a great deal of check in him if he were produced.

Now, may it please your Honor, I pass to the considerations which must ultimately determine the judicial mind in deciding this case, and I propose to show to your Honor a mass of evidence *which is not contradicted*, *much of which is put in by the other side*, and which displaces this invention of the telephone out of the life of Daniel Drawbaugh as effectually as the frost displaces the salt from the water which is frozen, — it leaves no place in his life or his record for the telephone.

I begin with the man himself as he first appeared and does appear in the history of his supposed invention. In 1867 he was a partner of Gov. Geary of Pennsylvania, of his private secretary, and of a gentleman named Eberly, in the manufacture of nail-plate feeding machines, which he had invented, and which they furnished him the money to patent, to exploit, and to introduce into use, — if it were capable of being so introduced. What is meant by that machine is simply an apparatus for feeding a strip of iron into a machine that cuts off nails; the machine *bites* the nails off at the end of a plate, which has got to be wriggled into the machine alternately right and left. Of course this is a very old machine: no nail machine exists without a feeder for the plate. Dan told them he could improve the old plans, and he got those people into partnership with him for that purpose. They built machinery and they got it into McCormick's mills, the largest nail mill in Harrisburg, owned in part by the Cameron family, I believe. Of course it was a failure, and it was turned out, as everything he ever did was.

MR. HILL. — I have no opportunity to reply, I know; but I know that you do not want to misstate facts.

MR. DICKERSON. — Not at all.

MR. HILL. — It was tried at McCormick's factory at West Fairview, and the laborers rose against it and made threats. For that reason it was discontinued.

MR. DICKERSON. — Very good; as you please. Then it was an invention of such merit that a combination of labor was made against it, and it could not go into use. It disappeared from public use.

But Drawbaugh is a remarkable man; he belongs to a class of which a great many are to be found in this country, in which Pennsylvania seems to be somewhat prolific, and of which Keely, the motor man, is at present the type, — men who have the capacity to persuade their fellow-men that they are great inventors, and thereby get their money. They are persuasive, pleasant, good-natured, agreeable sort of fellows, who are bubbling over with hopes and dreams and expectations, and who inspire other people with their *apparent* confidence. They operate upon their fellow-men in a kind of molassesy way, bringing in the flies that stick fast to them. Drawbaugh is one of that kind of men, who has exhibited this ability in a remarkable degree. Notwithstanding his failure in other things, "on account of labor combination" against him,— I am not going to quarrel about terms — others might give a different reason, — he persuaded a number of his neighbors, men of wealth and standing in the community, and of high character in every way, to go into the manufacture of his rotary molasses spigot, which could also be used as a rotary pump. One of the very old delusions in mechanics is a rotary pump. Next to perpetual motion, there is nothing that has attracted the attention of inventors more than a rotary pump. It is so natural that one should turn a crank and the water should come out all one way, without any reversal or stoppage as in other pumps. It is in the nature of things, however, impossible to be made perfect. They have all failed. There are lists of rotary-pump patents by the page in the Patent Office reports before his day. Every tyro in mechanics first thinks of a rotary pump before he knows the law that makes it impracticable.

Well, I assume that Drawbaugh didn't know that they were necessarily good for nothing. I do not charge any fraud upon him about that. He got those gentlemen in, and they invested about $25,000 in machinery to manufacture his rotary pump; and they set up an establishment at Eberly's Mills, into which he moved his own machinery, which he already had, and had been using in another shop; and they made him their "master mechanic." They also put him in funds; they paid him $6,000 in cash — $5,000 from one company, and a $1,000 note of another, which he got discounted — and gave him one of the shares of this company, for which they had paid $1,000 cash on their part, and made him their master machinist. Of course the thing was a failure, as it had been for a century before him. Drawbaugh says in his examination afterwards that it is a good thing, but people found it wouldn't wear. Well, that is just what ails it, — it won't wear. It is not good for anything; it cannot be made to wear. Everybody knew that before; but perhaps he didn't. About that time he began to tinker with electricity, and to work upon various other contrivances in that shop, and he used the tools, which he was free to use. A part of the money which he got from that sale he put into a house, and became a land owner, — a house for which he paid $2,000 in cash, while there was a mortgage on it for $300, which he afterwards paid off. In Pennsylvania they have a convenient method of creating a mortgage, which cuts off dower, by giving what they call a judgment note, and putting a stay of execution upon record. Now, that is a first-rate mortgage; it can be enforced any time after the stay expires; and there was upon the house when he bought it one of those judgment notes for $300. He then rented one half of that house to a good tenant for $110 a year, and he filled the other half with furniture and many luxuries, — all right and proper that he should; and he had so much of it, may it please your Honor, that when, eight years afterwards, he bought another house and removed that furniture, it took *seventeen* Pennsylvania horses with a string of Pennsylvania wagons to move that furniture to another house, and as many to bring it back when he made another change. His house was as well furnished, his family as well clothed, and himself living as well as anybody in that whole village. He was employed by this company to do their work, and he kept on doing it.

In 1870 this company had experienced the fatal effect of his embrace, and was dying of dry rot. But still they did not lose confidence in him. He had that buoyant and inspiring power so charming to everybody, except its victims, and they said, "Now we will form a coporation, and we will call it the '*Drawbaugh Manufacturing Company*,' in your name and in your honor." Notwithstanding the decrepitude of the whole concern, he still had their confidence, and they called it the "Drawbaugh Manufacturing Company," and by formal vote elected him "master mechanic" in 1870, at a time when, according to the present pretension, his telephone was filling the community with wonder and admiration. The new company soon got out of work, although they advertised largely with his name, and wanted something to do, and they passed resolutions on their minutes expressing their desires. He had told his partnar in 1869 that he could invent a gas governor. Well, a gas governor, as we all know, is older than Dan Drawbaugh. It is put on the gas main as it enters the house, and regulates the tension of gas so that the flame will not flare. He actually went to work and made a gas-making apparatus, — on a small scale, of course, — and piped this factory with gas pipe, and then sent for his partners to come and see his gas regulator work. Well, he didn't know anything about that thing, of course, and the machine exploded, as necessarily it would, the gas being under confinement, with no relief escape.

In cross-examining the complainants' witness, Jacob Carns, workman in the shop (complts, ii, 922), Drawbaugh's counsel asked if Drawbaugh did not put up a complete gas apparatus to exhibit his gas governor, with a view to getting the Drawbaugh Manufacturing Company to take hold of it and put it upon the market, and whether he did not "try to get the company to add the stamp canceller to the articles they were manufacturing and getting out," and "to take hold of the lamp-shade press and work that up also," and "to take hold of the blower," — to some of which questions the witness replies yes; to one, he replies that the blower was not a success, and to the others, that he does not remember. This of course means that the claimant had stated to his counsel that he did so try.

The company did not take them up because, for various reasons, these particular things did not promise success, — not because they were indisposed to exploit his inventions; on the contrary, they continued to invite him. The chronological sequence shows this.

Drawbaugh testified (defts, ii, 1001): —

"I made the second [gas governor] more complete, in order to show it to the Drawbaugh Pump Company, for the purpose of illustrating it to them, for the purpose of getting them to take an interest in it; there were some inquiries made about the machine, and it was found that the Gas Company would not allow it to be attached to the meter; I guess for that reason there was nothing done, they didn't take an interest in it."

The date of this is fixed by the records of the association (complts, ii, 1130–1; iv, 317–8): —

"Jan. 29, 1869. Daniel Drawbaugh agreed to give his gas Governor that HE IS NOW PREPARING TO SECURE A PATENT FOR to the company for the company's use and benefit the conditions to be agreed upon hereafter."

The exhibition in consequence of this vote, and which is referred to in Drawbaugh's deposition, is described by Mr. H. S. Rupp (complts, ii, 1130): —

"*Q.* 13. Did your company meet and examine the gas governor referred to in that request?
"*A.* Yes, sir.
"*Q.* 14. Was it an accidental meeting, or did the members of the company meet especially for the purpose?
"*A.* It was a special meeting called for that purpose.
"*Q.* 15. Where did the members meet and examine this gas governor; and give some description of the exhibition of it which was made, or attempted to be made, on that occasion?
"*A.* They met at the company's shop; Mr. Drawbaugh had everything prepared to manufacture the gas and show the lights, when the members met. The gas was made outside of the building, near the blacksmith shop. The lights were fixed, I think, on the second floor, and pipes were laid to convey the gas to that story, — it might, possibly, have been the first. It worked very well for a while, but the seam of one of the retorts opened by being heated, and that ended the exhibit of the gas governor."

Mr. Rupp then continues about the next proposal: —

"*Q.* 16. In the minutes of Jan. 29, 1869, already referred to, I find the following: 'On motion of William R. Gorgas and D. Drawbaugh, it was agreed that Henry S. Rupp be authorized to advertise in the *Patriot and Union* and *State Guard*, Harrisburg, one insertion each week for three weeks, that the company do custom work and get up designs, etc.' I infer from that that the company was seeking to do some work besides the manufacture of rotary pumps and measuring faucets; what is the fact about that?
"*A.* The fact is that they were seeking other work.
"*Q.* 17. In the minutes of the meeting of March 26, 1869, I find the following: —
"'On motion of Henry S. Rupp and Daniel Drawbaugh, it was

agreed that Daniel Drawbaugh shall, as speedily as possible not to interfere with other necessary work, get up and make a screw machine for the use of the shop and for its benefit.' What new project and kind of work for the company did that refer to?

"*A.* It referred to getting up a machine for manufacturing screws.

"*Q.* 18. What brought that project before the company, and state what proposals and suggestions Mr. Drawbaugh made about it, so far as you can recollect?

"*A.* I don't know that I am able to say exactly what brought us to — I think there was a gentleman there from Buffalo, a Mr. Dorsheimer, a relative of Mr. Gorgas, who told us about a manufactory that manufactured screws, stating that it was a paying business. Mr. Drawbaugh said that he could easily invent a machine, or get up a machine, that would manufacture screws; I think it was this that led us to this project of manufacturing screws."

He still held that company. After the gas exhibition they passed another resolution, — that he should invent screw machinery, for the use of the company: they must have something of his to keep them going. At that time, that room where they met was full of telephones, if the testimony which has been brought before this court be true. *But he never said "telephone" to a man of them*, although that concern ran until 1873. May it please your Honor, there were nine members of that concern. Eight of them survive, one is dead. There were about seventeen or eighteen workmen in that concern during those years, from 1867 to 1873. Sir, *not one man of that partnership*, and not one man of those employed mechanics (with two exceptions, who turned up as witnesses and are disposed of in our brief) ever saw, or ever heard, or were ever told, that Dan Drawbaugh had, or had invented, or had in their building, a talking machine, — *not one*. And those men are his friends, — they are his friends to-day; the molasses has them stuck yet, — they are his friends to-day. Some of them had a meeting, while this suit was pending, in the house of one of them, at which three of them assembled with Drawbaugh and his legal partner for the purpose of discussing whether they could not get up some evidence — of what? of what? Why, of his poverty. Not of his having made the telephone; not of his having it in their shop all that time; but of his poverty. They decided they could not even do that; they would like to, but they could not (complts, ii, 1140–1). He put upon the stand three of those partners, his friends, *and never said telephone to one of them;* and one of them was the *treasurer and timekeeper and superintendent* of the company, who spent his days in that place, where, if this testimony be true, country loafers, bummers, fellows like the Ditlows and Kahneys and such trash, were there talking all the time, and reading newspapers through telephones, that were there in plain sight, and known to the entire public, — so they swear. That place was forty feet long and twenty-five feet wide — you could get it into this room two and a half times; that was the size of it; it was a box, forty feet one way and twenty-five feet the other, where these men were huddled in together, and where Dan Drawbaugh had, as they now swear, all over that forty by twenty-five feet, this very apparatus, open to public inspection, and used by everybody who chose. Brief, 244–256, complts, ii, 1140-1.

Sir, that ignorance of all these men is a *fact* in this case; it is not an argument, it is a fact, which fact has got to be reconciled, if it can be, with the testimony on the other side. It cannot be reconciled; something must yield. That *fact* is what my opponents call negative evidence. Well, I think it negatives them out of existence. It is exactly as if some loafers or bummers should come and swear that in my house there were from year to year telephones stuck all round the house, and my family and I, and everybody who ever lived in it, should come and say that we were there every day, and that there was no such thing. That is what they call negative evidence. All this about the Faucet Company is in our brief, pp. 243–257.

Well, sir, Dan's fatal breath brought this company to the grave; and Dan then got another set of victims to come in and buy it — and they were the Hauck Brothers, in 1873. Hauck and his brothers paid $7,000 of new money, and got for it what had cost the others about $30,000. That much had shrunk and disappeared — "gone where the woodbine twineth." These brothers paid $7,000 to go into that place and see whether they could not make rotary pumps work. There was one man of that concern, David Hauck, who was an exceedingly intelligent man; and when you read his deposition you will perceive that he is a remarkably acute reasoner, and a good mechanic. But Dan was too much for him, and got him in there. These brothers went to work there, making these molasses spigots, or rotary pumps, or whatever they were, in that place, from 1873 to 1875, Dan Drawbaugh working in the shop with them, but not for them.

Now I am going to tell you a little of the poverty there was there. The Haucks offered him "*his own price*" — of course, that meant a reasonable price, but "his own price" — to work for them on their faucets; but he declined, because he could do better working his jobbing shop for himself; he had the tools and the machinery, and he declined the offer, because he was doing job work for the country side, and it was better business than working for wages, and it was more independent: he could spend his time on his fooleries, of one kind and another, as he pleased. Brief, 357.

During that time Drawbaugh claims to have *invented* several good things. He "*invented*" this magneto key that we hear about, and he was very anxious to get it tried on a telegraph line, because, as he said, it would supersede the present telegraph. Now note that. These witnesses are swearing from time to time that Dan was going to supersede the telegraph (brief, 80), and they attribute it to his telephone. But it is certain that he said that this "key" would do so. The key, however, was very old; it was the Siemens key. Dan, of course, knew about it. We have not traced the books with it into his hand, but I suppose he knew about it. It is in any handbook of electricity. Well, sir, he got David Hauck to take him with his Siemens key to a telegraph station, where Hauck's friend was operator, and Hauck got leave for him to try his telegraph key on a real telegraph line at Mechanicsburg, in order to ascertain whether it was a practical and successful thing to "supersede the telegraph." At this time, as he now gets witnesses to swear, he had got the telephone up to a point where he had **B**, **F**, **C**, **I** and **A**; he had not got **D** nor **E**, which are the magneto telephones patented by Bell in 1877, but he had everything behind that, and, having all these, *he took that telegraph key and not the telephone up to a real line to have it tried*. Of course it was worthless. An operator cannot wabble that three or four pound magnet by his fingers, and send signals by it with any effect. The thing operated by the finger must be something light, that the finger can handle quickly and easily. Dan tried it, and the operator told him it wouldn't do. What did he do then? He went back and *made another of these keys*, reducing the weight of the moving part. There is no drawing of that thing here, but, so far as the magnet goes, it is exactly the same thing as the horseshoe magnet on C. He went to his shop and made another one, and then took it to Harrisburg and showed it there, and of course it was of no use; BUT ALL THE WHILE HE WAS STARVING FOR FOOD, AND WILD TO GET SOME ONE TO TRY HIS TELEPHONE!! Brief, 322.

After a while there emerged an improvement on the molasses spigot, which was invented by somebody in that shop. The old one was good for nothing, and Hauck, who was trying to make it work, and had his $7,000 in it, was trying to improve it so that it would work, and an invention was made, and Dan Drawbaugh said *he* also invented the modification. I am not going to talk about who was the inventor: it is enough to say that there was such a controversy between those two persons. Dan's old company, before that time, had said to Drawbaugh that he ought to give them any improvements on the spigot he might make; but he refused. They said, "We have sunk a great deal of our money here on your invention, and you ought to help us; and if you have any new ideas on it, give them to us." Dan refused, and said he meant to get that money for himself, and they shouldn't have his new ideas. He had a right to say that. I do not bring it against him as a legal wrong, but it was characteristic of the man; and so his new ideas, if he had them, slumbered until Hauck got the same ideas, and then Dan claimed them, and an interference suit arose in the Patent Office.

The way that interference came about was this: Chellis, the ninety-nine-cent man, and this Dr. Moffitt, of whom we have heard, bought from Dan, in 1878, the potentiality of a patent on the new molasses spigot, and paid him $250 cash for a part interest in it; and they went into the interference suit with Mr. Hauck, who claimed to be its inventor. Altogether a fair transaction, — nothing wrong that I know of about it. Now there is some very interesting reading in that trial. Drawbaugh made the issue, and undertook to prove two things: *first*, that he was a mechanical expert, qualified to testify in that capacity before the court; and, *second*, that he was a "*natural-born*," original and great inventor, and therefore that he ought to be selected by the

Patent Office rather than Mr. Hauck as the inventor of this wonderful, new, improved molasses spigot; and, to sustain this issue, Dan Drawbaugh used Hauck as his own witness. Now Hauck, may it please your Honor, had been Drawbaugh's companion, working alongside of him for years in that shop forty feet by twenty-five, where Dan had all these telephones, and where they say the whole country came in to see them; and he had been Dan Drawbaugh's friend so much as that he had gone with Drawbaugh and got him leave to apply and try his key upon a telegraph line; and therefore no man knew Dan's inventions in these years better than Hauck, and he could be used with the greatest effect to prove Dan's originality of genius by merely telling what he knew of Dan's work. Mr. Hauck was questioned by Dan's present partner, Jacobs, with Dan present, to help the examination. Dan and Chellis and Jacobs were on one side, and Hauck was on the other. When Hauck was on the stand to tell his story, Dan undertook to prove his own genius by Hauck; and here is the first question by Dan's partner to Hauck (complts, iv, 252; i, 835): —

"*X Q* 3. He [meaning Drawbaugh] is a machinist, is he not?
"*A*. That is one of the trades he is proficient in.
"*X Q*. 4. Then he is a man of versatile talents, is he?
"*A*. He is."

I am here, your Honor, to prove that to-day.

"*X Q*. 5. AND A BORN INVENTOR, IS HE NOT?
"*A*. That I cannot say, as I have only known him for *about ten years*."

He was not there when Dan was born, your Honor!

"*X Q*. 6. You are aware, however, that he has made a great many useful and ingenious inventions, are you not?
"*A*. What he has made since *I have become acquainted with him, that I have any knowledge of*, I would call *imitations*, although some of them might be patentable.
"*X Q*. 7. To what inventions do you refer?
"*A*. I refer to the blower spoken of in this controversy; also to an automatic boiler feeder, AND TO A MAGNETIC CLOCK, and to a steam siphon or a steam pump, and a hydraulic ram; that is all I can think of at present.
"*X Q*. 8. Mr. Drawbaugh also invented a measuring faucet, did he not, the patent upon which you subsequently purchased?

"*A*. He did.
" X *Q*. 9. Was that an imitation, too?
A. It was, to a great extent."

X *Q*. 29. While he was perfecting his clock he told you about invention and his experiments upon it, did he not?
A. He did.
" X *Q*. 30. Once, or more than once, did he talk to you?
"*A*. He talked to me about it a great many times.
" X *Q*. 31. Did he ever talk to you about any of his other inventions?
"*A*. He did.
" X *Q*. 32. *He was generally pretty free in communicating his ideas to friends, wasn't he?*
"*A*. He was.
" *X Q*. 33. About what time did you have your conversation with him about his magnetic clock?
"*A*. Principally from 1875 to 1877."

. . . .

" X *Q*. 42. Returning to the subject of the magnetic clock, in what points is that an imitation?"

He replied (x-ans. 49) that it was taken right out of the encyclopædia.

And then they cross-examined him to see if they could prove by him whether Drawbaugh had not introduced some modifications of detail in his clock as to which the witness said that he could not tell, — but the Court knows now what the facts are, — and finally they wound up with this: —

" *X Q*. 52. And you undertake to swear that Daniel Drawbaugh is an imitator and not an original inventor.
"*A*. I believe him to be an excellent imitator, while I do not say that he could not be called an inventor."

And there they left it. Well, they did not get much satisfaction out of that witness.

Mr. Hill. — That was the contestant?

Mr. Dickerson. — Yes, but you called him as your witness on this issue, and tried to make him prove your case, that your partner was the great man that you now say he is. His enemy swore he was not. Well, his enemy certainly is not to be trusted in every sense, and he certainly would not help Drawbaugh. I agree to that. But you could have silenced his enemy by making him admit that years ago Dan had the Bell telephone right in the shop where this man worked; *and you never said telephone to him.*

Now Mr. Hauck's turn came. Thus far, your Honor sees, the dog was a little ahead of the wolf that he was hunting; but, as soon as Drawbaugh went on the stand, Mr. Hauck said, in substance, "Well, you have called me as a witness to prove that you are a great inventor. I don't know that you are. I have told you all I know about you. You are an impostor. Now tell me what you know about yourself, — what have you done? I want to know now. It is your issue; tell me." Now, sir (complts, iv, 142): —

"*Q.* 104. *Since 1866, what machines have you conceived and perfected that have worked satisfactorily?*"

This to Dan Drawbaugh, — the wolf was after the dog very fast just then!

"*A.* To the best of my knowledge, I think that they all have. The *nail machine* gave satisfaction. I had it running in the works, but the nailers drove me out. The *tram and red staff was a good machine*, and adopted by a number of millers, and acknowledged by them to be a good machine. The *magnetic clock I consider a good thing, but I am not through with experiments on it.* I believe this *last faucet is a good thing.*"

He didn't say the *first one* was.

"X *Q.* 105. Was the nail machine you speak of a success, and was it ever put into general use?

"*A.* *I cannot say it was not a success;* but from reason of the nailers being down on it, *I was afraid* to put them in."

This is not exactly his partner's statement now, but I will take it.

"X *Q.* 106. Are there not now, and *were there not at that time*, other patented machines in use at other mills, that were constructed to accomplish the same purpose that yours was?

"*A.* There was at the time that I was putting a machine in the works of Harry McCormick's nail mill at West Fairview, Cumberland Co., Pa., a machine or feeder for making small nails only. Mine was intended for larger nails. I worked my machine on ten or twelve penny nails. Some years after the trial of my machine I seen other machines for the same purpose. I would correct my former statement, and say my machine was intended for all sizes of nails.

"X *Q.* 107. Was not the old faucet a partial failure until the Haucks perfected it by constructing a new machinery to manufacture it by?

"*A*. No, sir.

"*X Q*. 108. Was not the rotary pump a failure practically?

"*A*. *I cannot positively say it was. There were parties that liked them, that used them, but thought they were not very durable.*

"*X Q*. 109. Is not the magnetic clock, *so far, a failure?*

"*A*. No, sir; I don't think it is; but, as I stated before, I am not through with my experiments.

"*X Q*. 110. Will it keep accurate time?

"*A*. At my place I have tried several, and they kept accurate time. I regulated and *tried them by a transit*."

There was Drawbaugh called upon to vindicate himself in the assertion that he had made, and upon which he had called his adversary as a witness. Well, sir, that piece of testimony needs a little explanation. Somebody ought to tell us about that now. The whole deposition was put into Dan Drawbaugh's hands in this case, and he was asked in substance whether it was correct, and whether he wished to modify or explain anything, to which he replied that it was correct, and he had nothing to say. He took it, read it, went through with it, and said that he was content with it as it was; it was right (defts, ii, 1065, x-ans. 1480; *ib*. 1070, x-ans. 1497). Yet that needs somebody to explain it; and we fortunately have got the explanation. It is in the brief. *This is what they ask your Honor to believe is the explanation of this testimony*, — because it is the biggest kind of a fact that stands right across the telephone; and *that was in the summer of 1879*, when Bell had been famous for three years. Now I will turn to their brief, p. 297. They there quote, your Honor will perceive, the very question and answer that I have already read, and they thus explain it: —

"Now, examining the question put to the witness, it will be seen that it *does not include the talking machine which was conceived prior to* 1867, *but only such machines as were conceived* '*since* 1866,'— that is to say, in 1867, or subsequently."

Then they go on, and about half way down the next paragraph say: —

"He therefore specifically mentions four inventions."

Mr HILL. — Read the whole of it; don't pick out parts.

Mr. DICKERSON. — I like to gratify you, and I will, because I find it always benefits me when I gratify you. I read it all.

"Again, the witness's answer shows conclusively that he *did not feel called upon by the question to set forth a list of his inventions.* Accordingly, he answers the question in one line: 'To the best of my knowledge, I think they all have.' That was a complete answer to the interrogatory, disposing, in one sentence, of the whole matter of the inquiry. Having given this answer, it evidently occurred to his mind to mention some of his machines which had notoriously been in public use and on sale, and of the *acknowledged merits of which his interlocutor must be aware.* He therefore specifically mentions four inventions out of the large number which he HAD MADE DURING THE PERIOD OF THE INQUIRY. He did not even specifically mention all the machines."

Now, may it please your Honor, what were those four that he mentioned that were *not conceived before 1866?* Because your Honor now sees the explanation is that he was under the limitation of 1866, and anything that he conceived before that he could not *conscientiously* put into his answer. What are the four machines? The nail machine; the tram and red staff; the magnetic clock; and the last faucet. Now I shall astonish your Honor by telling you that the nail machine was patented in 1865 — one year before the limitation of the question begins; and the tram and red staff was patented in 1863, three years before the limitation. Of course, Dan Drawbaugh didn't come on the stand to tell any such lie as that; he knew that the tram and red staff were patented before 1866. But, sir, the patents are in this record. "Levelling the faces of millstones; application Feb. 23, 1863; patented May 12, 1863." That is one of those things that he had not conceived of before 1866, as his partner assures you in print, and which he therefore conscientiously excluded from his answer. The next one is the patent for the nail-plate feeder, applied for Aug. 24, 1865, patented Dec. 12, 1865. (These are in complts, iv, 345–6.)

Now, may it please your Honor, what do you think of that? That testimony is a fact that had to be dealt with. They could not jump it; they could not go under it, or around it, or over it. Dan Drawbaugh could not come to meet it, but his partner can, and he tells you Dan *did not make those things before 1866*, and therefore he put *them* into his answer and omitted the telephone, — when they were patented, one, one year, and another three years before, — but that he conceived the telephone *before* 1866, and therefore he *omitted it* from his answer.

Mr. Hill. — I said the terms of the question did not call for anything of the kind.

Mr. Dickerson. — Well, if I have not got that through your hair, I give it up.

Now, may it please your Honor, there is another piece of business here. In this interference, as I read to your Honor, Drawbaugh said his clock was not yet completed; he thought it a good thing, but it was not yet completed. Didn't it keep time? He said it did; but still he was going to make it keep a *little better time.* He had got somehow mixed up between the sun, and the transit, and the clock; he didn't know which was right, but he was going to get them so that they would agree in some way or other. Well, sir, what was the fact about that at that date? This Dr. Moffitt, of whom I have spoken, this dentist, with the habit of disappearing —

Mr. Hill. — "Habit of disappearing" *is a mere assumption.* There is nothing of the kind in the testimony, that I remember.

Mr. Dickerson. — I thought you would say that again, so I am ready for you. Turn to p. 991 of defendants' Vol. III., surrebuttal. George May, their witness, says: —

"*X Q*. 110. What work did you do for Dr. Moffitt in 1882?

"*A*. I went there to hire with him to do his work, and then Mr. Moffitt went away, and Mrs. Moffitt thought there would be no more work for me, and so I went away.

"*X Q*. 111. He went *away pretty suddenly, and people didn't know where he had gone, isn't that so?*

"*A*. *Yes, sir.*

"*X Q*. 112. His wife was alarmed about him, and sent Squire Drawbaugh to hunt for him, didn't she?

"*A*. That is more than I can say.

"*X Q*. 113. *It was a* NUMBER OF WEEKS *before he was heard of, wasn't it?*

"*A*. *Yes, sir.*

"*X Q*. 114. And then it was reported that he had got on a drunk and gone off in that condition, was it not?

"*A*. That I cannot say.

"*X Q*. 115. You heard that story about him, did you not, at the time?

"*A*. I kind of heard something about him, but never paid much attention to it."

Now you had better not interrupt me any more.

Sir, this Dr. Moffitt was Drawbaugh's partner then. Your Honor will recollect that in this faucet business, about which the Patent Office fight was, Moffitt, Chellis, and Drawbaugh were the three partners. Moffitt had one of those clocks sent to his house. They never sold one. Two or three were made, but they could not sell one. They could not even give one away. Dr. Moffitt was a dentist. Well, a dentist chops up his days into hours and minutes to suit his customers; he has got to have some kind of notion of time, else he cannot keep his appointments. It is necessary for a dentist to know when his half hours come round. We cross-examined him upon that (defts, i, 521): —

"*A*. I had one in my house.

"*X Q*. 33. When?

"*A*. I lived on Market Street at the time; it was while the Clock Company was in operation; I think it was in 1878.

"*X Q*. 34. Did it ever trouble you by stopping and not keeping good time?

"*A*. No, sir.

"*X Q*. 35. Did it always keep good time and not stop?

"*A*. No, sir; it did not always keep good time.

"*X Q*. 36. Did it always keep going?

"*A*. Yes, sir."

Well, of course it will keep going: as long as electricity runs, the clock will go.

"*X Q*. 38. Did you ever complain of it more than once?

"*A*. I don't remember; I remember of one time.

"*X Q*. 39. Whom did you buy it off?

"*A*. No one.

"*X Q*. 40. Do you mean that you only borrowed it?

"*A*. Neither one; I did not own it, nor I did not buy it, nor I did not borrow it.

"*X Q*. 41. How did it come into your possession?

"*A*. It was put there by the company, with my permission.

"*X Q*. 42. Did you tell them that they must come and make it go better, or come and take it away?

"*A*. I don't remember; I wrote to one of the company, not to Drawbaugh, that if the clock did not run better they must take it away.

"*X Q*. 43. Did Drawbaugh or any of the company come over to see you, in consequence of that complaint?

"*A*. Mr. Shettel came to see me.

"*X Q*. 44. Did not Mr. Drawbaugh come too?

"*A*. Mr. Drawbaugh did not come at that time."

His own friend and partner turned it out of the house. Why, the poor fellow could not keep any time for his patients; could not tell when his dinner was ready. His cook would have dinner on the table half an hour fast, or as much slow; and his patients would come and say, "Why didn't you keep my appointment?" "Well, Dan's clock is all wrong." "Take it out!" Didn't Drawbaugh swear it was a good invention? Yes, he swore it was a good thing, but he hadn't got done experimenting on it. One of his experiments was on Dr. Moffitt.

There was another interesting fact in that case. Dan Drawbaugh was going to qualify himself as an expert, and he testified that he was a patent solicitor (complts, iv, 123): —

"*Q.* 100. Have you applied for and procured in person patents for any of them, or have you not?

"*A.* Yes, sir; *I mean I made my own specifications, models and drawings, and drew my claims.*

"*Q.* 101. Have you or have you not done the same *for other inventors?*

"*A. Yes, sir; I have.*

"*Q.* 102. How long have you been working in machinery?

"*A.* From the time I first could work.

"*Q.* 103. Have you worked at anything else?

"*A.* To the best of my knowledge, I have not.

"*Q.* 104. Have you or have you not read and studied much upon the subject of mechanics and upon kindred subjects?

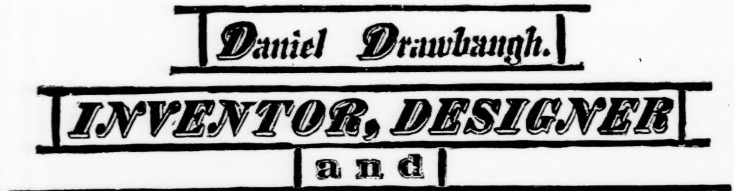
"*A. I have read a good deal, more particularly upon mechanical subjects.*"

Thus he qualified himself; and he did it again upon cross-examination good and strong (complts, iv, 155): —

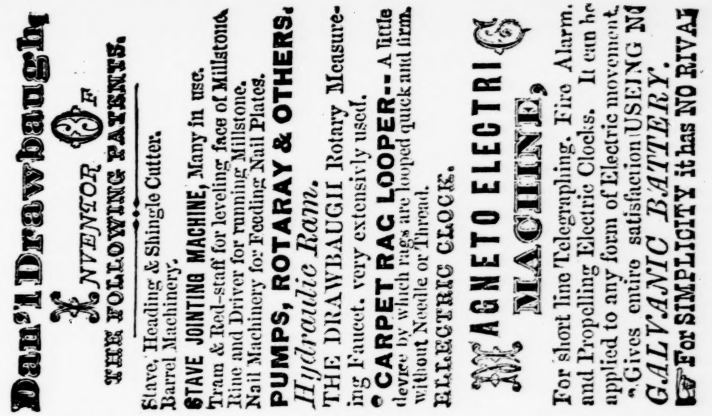
"*X Q.* 180. You stated that you have made your own specifications, models and drawings, and also done so for others: have you not uniformly had an attorney of record in all your patent cases, in addition to yourself, who has supervised and corrected your specifications and claims?

"*A.* All my cases through the Office were gotten by attorneys, but some of them were dictated and drawn up by me. Though I have taken out a number of patents for other parties, *I prepared their papers and drawings, but they made their own applications. It was not then necessary to have a power of attorney from the parties. There was no attorney of record in these cases.*"

He was swearing as to his capacity, in order to be believed by the Court, as an expert. In this case, however, it was an uncomfortable fact; because he had told this Court, and sworn to it, and they had in their answer sworn that he could not get a patent for want of money,— yet all this time he was a patent solicitor, and had been getting patents for other people. It came to be a very uncomfortable fact on record, and it was necessary to displace that fact. Thereupon they called their other attorney, Benjamin, and he swore Drawbaugh was entirely incompetent to take a patent, and didn't know anything about it. They called Drawbaugh, and he swore he didn't know anything about it, and couldn't do it (defts, ii, 900, 929; ii, 1270–1; brief, p. 198). In this case the other side of the picture turned up, and he had to *disqualify* himself; because, if he was qualified, why hadn't he filed a specification for himself in the Patent Office? and then $15 was all the money needed. Pretty bad! He was between the devil and the deep sea. Well, they took the deep sea this time, and they swore him through that he could not have done it. He swore to it, and his attorney swore to it. I will not read it. I have stated it. Very well. But, unfortunately at that time, Dan Drawbaugh had a card out before the public, of which this is a photo-lithograph copy (complts, ii, 1212; iv, 261):—



Daniel Drawbaugh.
INVENTOR, DESIGNER
and
SOLICITOR: PATENTS.
☞Also Models Neatly Made To Order.
Eberly's Mills,
Cumberland County, Pennsylvania.
[See Other Side.]



Dan'l Drawbaugh
INVENTOR OF
THE FOLLOWING PATENTS.

Stave, Heading & Shingle Cutter.
Barrel Machinery.
STAVE JOINTING MACHINE, Many in use.
Tram & Red-staff for leveling face of Millstone.
Rine and Driver for running Millstone.
Nail Machinery for Feeding Nail Plates.
PUMPS, ROTARAY & OTHERS.
Hydraulic Ram.
THE DRAWBAUGH Rotary Measuring Faucet. very extensivly used.
• CARPET RAC LOOPER-- A little device by which rags are looped quick and firm without Needle or Thread.
ELLECTRIC CLOCK.

MAGNETO ELECTRIC MACHINE,

For short line Telegraphing. Fire Alarm. and Propelling Electric Clocks. It can be applied to any form of Electric movement. "Gives entire satisfaction USEING NO *GALVANIC BATTERY.*
☞ **For SIMPLICITY it has NO RIVAL**

Now, may it please your Honor, we had heard about that card, and you can imagine what a time we had in getting it. I will not tell the story how it was done; but it was curious. All that had been issued *suddenly disappeared* from the face of the earth, and the difficulty was to get one. Money was no object to get that card. It would amuse you to know how it was done. I have not time for that, and of course it is not on the record. But we got it. Here was the regular business card of this man, who was taking twenty dollars apiece from people for obtaining their patents. And before we got it, and when they thought we should not get it, they had called him and their attorney, Benjamin, to testify — what? That he is entirely incapable of doing it; THAT HE IS AN IMPOSTOR. Did I say too much when I said I was going to prove him an impostor?

Now, your Honor, those are facts; not arguments, but facts. There is only one conclusion from them. But that card ought to be explained somehow or other. There should be some reason given why it ought not to carry its logical consequence. It gives a list of Dan's inventions, and *does not say telephone!*

The COURT. — What was the date of the card?

Mr. DICKERSON. — Between June, 1874, and the latter part of 1876. There were two editions published of them.

Mr. HILL. — The testimony of E. R. Holsinger, called both by the defendants and the complainants, shows the date of the card.

The COURT. — What do you claim as the date of the card?

Mr. HILL. — Between the middle of September, 1873, I presume, and the last of November, 1876. I presume some time while Holsinger was living there. It was published by Holsinger while he was living at Eberly's Mills, which was from September, 1873, to the last of November, 1876.

Mr. DICKERSON. — The joke of it is that Holsinger bought the type to print it with, and *the pauper Dan lent him the money to buy it.* And this was done after June, 1874.

The COURT. — Is there not a reference to it?

Mr. DICKERSON. — Yes, sir.

Mr. HILL. — A reference in both briefs.

Mr. DICKERSON. — Yes; we will not differ about it.

It is in the complainants' brief, pp. 196, 199. Holsinger proves that the peculiar type with which it was printed was bought the last of May, 1874, with money, part of which Drawbaugh lent him; and then he testified (complts, ii, 1212): —

> "*Q.* 9. Please look at the advertising card, which I now show you, and state whether you printed it while you lived at Eberly's Mills.
>
> "*A.* Yes, sir.
>
> "*Q.* 10. State, as near as you can recollect, how many of them you printed.
>
> "*A.* I printed one hundred and fifty the first time, and think I printed a second lot of one hundred and fifty; I am not positive as to the second lot."

Drawbaugh has not denied this, and they did not cross-examine Holsinger about it. One lot after June 1, 1874, and after they were used up a second lot.

Now, your Honor, that card does need some explanation. It is like Dan's deposition in the Hauck case: it needs some explanation; and it will not do for his partner or his counsel to stand up in this court and not give any. But I notice that our eminent, very able and honorable friend, Mr. Edmunds, — and, if there be a man upon earth that can find an explanation, it is he, — *did not mention any of those things, and didn't attempt to explain them.* I notice that Dan's partner does not in speech, but he does in his brief; and I wish your Honor to look at it, because it is a most interesting specimen of jugglery. I refer your Honor to defendants' brief, p. 295, where Dan's partner gives the reasons why the telephone was not mentioned on this card. They were three. The first one is, *that he omitted it* PURPOSELY, for *fear his telephone would be stolen;* that is, he feared that with this card giving notice to the world that he had a telephone, everybody would want it, and he was in danger of having it stolen. The second reason is, that it *was omitted* BY ACCIDENT, and that he and Holsinger being very poor when they discovered the accident, didn't have money enough to reprint it. And the third reason is, that he was afraid he would lose custom if he said he had invented a telephone, because people would believe him crazy to make a thing nobody wanted, and so he omitted it. I don't want to lose a word of this, because it is rich. Dan and his partner are giving their reasons. I read them from their brief (p. 296): —

The first reason is, that,

> "inasmuch as Drawbaugh considered the invention to be of great value, *and the crowning work of his life*, and found himself unable to secure capital at present to patent and introduce it, and *did not wish to have it stolen from him*, nor to have it get into public use until patented, he may not have considered it wise to advertise it."

The second reason is that

> "it may have been omitted from the card by accident," "and, as both men were very poor, the mistake was never corrected by the issue of a new edition of the card."

The third is,

> "Drawbaugh, advertising for business jobs, and aware that even his sanity had been extensively questioned by reason of his work on the talking machines, and relying upon his personal efforts with capitalists to induce them to take hold of it, patent it, introduce it with capital sufficient to render the enterprise a success, and thus vindicate the soundness of his intellect and his judgment, may have deemed it wise not to include it in the advertised list. People who believed the talking machine an evidence of insanity might thereby have been deterred from bringing their work to him."

Mr. HILL. — Now please add to that, as you guess at reasons, that those are introduced as causes that might be at least as reasonable as those that you give.

Mr. DICKERSON. — I think his Honor understands it. That makes the three reasons. *First*, he didn't put it there because it would be stolen; *second*, because he forgot it; *third*, because he would be considered insane and would lose his jobs of work. What kind of a job would he lose? The principal jobs that he would lose, by the looks of that printed card, would be jobs of soliciting patents.

The COURT. — Do you say there was a second edition?

Mr. DICKERSON. — There was a second edition. Although Holsinger's testimony on that subject is not very decided, it is to the effect that there was a second edition; and Dan does not deny it.

Mr. HILL. — Might and might not have been.

The COURT. — Holsinger printed the card?

Mr. DICKERSON. — Yes; *and he had a newspaper there with Dan's solicitor-of-patents advertisement in it.*

Mr. HILL. — He had a little office there with a handful of type. The newspaper that they had there was about that long [*illustrating*].

Mr. STORROW. — He is the printer and publisher of a newspaper now and was before he went there.

Mr. HILL. — At this time he published what they call a newspaper, of which five or six numbers were printed, about so long and so wide [*illustrating*]. In 1875 and 1876 he was living at Milltown, and he swears that he saw those telephones all the time that he was there.

The COURT. — What telephones did he see before this card was printed?

Mr. HILL. —He saw *all alleged in our evidence to have been there*. He saw **D** and **E**, for instance.

Mr. DICKERSON. — Oh, yes! he filled the bill right full. There was nothing that *he* left out.

Mr. HILL — They called him as their witness as well as we.

Mr. DICKERSON. — We called him to prove writings which destroyed his deposition for the defence. Here is his answer: "I printed one hundred and fifty the *first time* and think we printed a *second lot of one hundred and fifty;* I am not positive as to the second lot." (Complts, ii, 1212.) That is his testimony. I think I do not overstate it.

Mr. Hill has very kindly interrupted me, and made a statement, for which I render him my thanks; he says that Holsinger knew all about the telephones. I will make a digression, and tell you about him and what he did know. He was not only the printer to print these things, but he was a literary gentleman, like Silas Wegg, and he corresponded with a country newspaper called the Carlisle *Mirror*, under the euphonious pseudonyme of "River Echo." One of our best pieces of work was to identify Mr. Holsinger with "River Echo." We put him on the stand, and he admitted that he was the man. Mr. River Echo, in the fall of 1875, wrote to that paper of his about Dan Drawbaugh (he probably called him Mr. Drawbaugh. I call him "Dan" for convenience; it is his familiar name in the record), — the letter is dated Nov. 16, 1875 (complts, ii, 1216; complts' brief, p. 201): —

> "We have the pleasure of announcing to the wide world that our Milltown (Eberly's Mills) has now the new axle factory established in the old machine shop at this place by a company of four live and energetic members, one of which is our friend, Wilson Bear, of Camp Hill, as the general business manager, and M. N. Grove, of Harrisburg, as corresponding secretary. They make the Kline conical, compensating axle, a new invention of Mr. Kline's, of Camp Hill. We wish them every success, for we think it is a very good improvement in that line.
>
> "ELECTRIC CLOCK WITHOUT A BATTERY IS BEING GOTTEN UP IN OUR TOWN BY DANIEL DRAWBAUGH, TO BE EXHIBITED AT THE CENTENNIAL NEXT FORTH. IT WILL BE ONE OF THE THINGS NOT DREAMT OF BY EVERY ONE, AND BE A CREDIT TO THE NATION, FOR ITS WONDERFUL SIMPLE WORKINGS AND GREAT CONVENIENCE."

Now, sir, they called this man to the stand, and he swore that Dan Drawbaugh was working at that time, — the fall of 1875, — day and night, on telephones, and *never worked on any other thing*, except it might be his *electric key*. *Specifically, that he never worked on another thing*, excepting it might be the electric key; at the very day and hour, sir, when he wrote that letter puffing Drawbaugh as the inventor of "the justly celebrated electric clock." That is frightful, but it is a fair sample of the swearing these people have been able to procure.

I am much obliged to you for the interruption which led me to it. That disposes of Holsinger.

The COURT. — What is meant by the magneto-electric machine on the card? What is said on that subject?

stolen; *second*, because he forgot it; *third*, because he would be considered insane and would lose his jobs of work. What kind of a job would he lose? The principal jobs that he would lose, by the looks of that printed card, would be jobs of soliciting patents.

The COURT. — Do you say there was a second edition?

Mr. DICKERSON. — There was a second edition. Although Holsinger's testimony on that subject is not very decided, it is to the effect that there was a second edition; and Dan does not deny it.

Mr. HILL. — Might and might not have been.

The COURT. — Holsinger printed the card?

Mr. DICKERSON. — Yes; *and he had a newspaper there with Dan's solicitor-of-patents advertisement in it.*

Mr. HILL. — He had a little office there with a handful of type. The newspaper that they had there was about that long [*illustrating*].

Mr. STORROW. — He is the printer and publisher of a newspaper now and was before he went there.

Mr. HILL. — At this time he published what they call a newspaper, of which five or six numbers were printed, about so long and so wide [*illustrating*]. In 1875 and 1876 he was living at Milltown, and he swears that he saw those telephones all the time that he was there.

The COURT. — What telephones did he see before this card was printed?

Mr. HILL. — He saw *all alleged in our evidence to have been there.* He saw **D** and **E**, for instance.

Mr. DICKERSON. — Oh, yes! he filled the bill right full. There was nothing that *he* left out.

Mr. HILL — They called him as their witness as well as we.

Mr. DICKERSON. — We called him to prove writings which destroyed his deposition for the defence. Here is his answer: "I printed one hundred and fifty the *first time* and think we printed a *second lot of one hundred and fifty;* I am not positive as to the second lot." (Complts, ii, 1212.) That is his testimony. I think I do not overstate it.

Mr. Hill has very kindly interrupted me, and made a statement, for which I render him my thanks; he says that Holsinger knew all about the telephones. I will make a digression, and tell you about him and what he did know. He was not only the printer to print these things, but he was a literary gentleman, like Silas Wegg, and he corresponded with a country newspaper called the Carlisle *Mirror*, under the euphonious pseudonyme of "River Echo." One of our best pieces of work was to identify Mr. Holsinger with "River Echo." We put him on the stand, and he admitted that he was the man. Mr. River Echo, in the fall of 1875, wrote to that paper of his about Dan Drawbaugh (he probably called him Mr. Drawbaugh. I call him "Dan" for convenience; it is his familiar name in the record), — the letter is dated Nov. 16, 1875 (complts, ii, 1216; complts' brief, p. 201): —

> "We have the pleasure of announcing to the wide world that our Milltown (Eberly's Mills) has now the new axle factory established in the old machine shop at this place by a company of four live and energetic members, one of which is our friend, Wilson Bear, of Camp Hill, as the general business manager, and M. N. Grove, of Harrisburg, as corresponding secretary. They make the Kline conical, compensating axle, a new invention of Mr. Kline's, of Camp Hill. We wish them every success, for we think it is a very good improvement in that line.
>
> "ELECTRIC CLOCK WITHOUT A BATTERY IS BEING GOTTEN UP IN OUR TOWN BY DANIEL DRAWBAUGH, TO BE EXHIBITED AT THE CENTENNIAL NEXT FORTH. IT WILL BE ONE OF THE THINGS NOT DREAMT OF BY EVERY ONE, AND BE A CREDIT TO THE NATION, FOR ITS WONDERFUL SIMPLE WORKINGS AND GREAT CONVENIENCE."

Now, sir, they called this man to the stand, and he swore that Dan Drawbaugh was working at that time, — the fall of 1875, — day and night, on telephones, and *never worked on any other thing*, except it might be his *electric key*. *Specifically, that he never worked on another thing*, excepting it might be the electric key; at the very day and hour, sir, when he wrote that letter puffing Drawbaugh as the inventor of "the justly celebrated electric clock." That is frightful, but it is a fair sample of the swearing these people have been able to procure.

I am much obliged to you for the interruption which led me to it. That disposes of Holsinger.

The COURT. — What is meant by the magneto-electric machine on the card? What is said on that subject?

Mr. DICKERSON. — That is the "electric key," so called for short. That is the thing that occupies the great part of the card. I will tell you what it is for, because your Honor will find it is very interesting reading, presently. He says it is to be used for "short-line telegraphing."

The COURT. — Oh, yes! I see.

Mr. DICKERSON. — [*Reading from card:*]

"*For Fire Alarm* and Propelling Electric Clocks. It can be applied to any form of electric movement. Gives entire satisfaction, useing no galvanic battery. For simplicity it has no rival."

About one third of that card is occupied with that as the *great thing on it.*

The COURT. — That is what is termed in the testimony the "electric key."

Mr. DICKERSON. — Yes, sir; sometimes electric key, and sometimes magneto key or machine; sometimes the "signaller"; that is the contrivance which Mr. Hauck had got him leave to try on the telegraph line at Mechanicsburg, and which he afterwards took himself to Harrisburg, and exhibited there. I will mention that presently. Brief, p. 322.

Now I am just putting facts in here; a child can draw the conclusions; it does not require any argument.

"River-Echo" Holsinger did this swearing about Dan (defts, i, 381):

"*Q*. 45. From all you saw of Mr. Drawbaugh's operations and employment during the time that you lived at Eberly's Mills, what was he experimenting on principally?

"*A*. *The talking machine; he appeared to be crazy on it.* I often tried to get information from him on other subjects, and about a half a minute's talk would turn him right on the talking machine; that is about his standing, — the way he felt all the time I was there."

"X *Q*. 108. While you lived at Eberly's Mills, was not Drawbaugh capable of earning all he needed if he would only work steadily?

"*A*. Yes, sir; he did work steadily, intently, never lost one moment, but, *influenced by some supernatural or other power*, did not happen to work at such things as did or would bring him the required necessaries for the sustenance of himself and family.

"*X Q* 109. What things did he work at?

"*A*. He put a great deal of time in experimenting on his talking machine; in fact so near all his time that he got very little earned.

"*X Q.* 110. What other inventions was he working on during the three years and a quarter that you lived at Eberly's Mills?

"*A. I do not remember of anything that he was working on except a magneto electric machine;* but whether he worked on that as an invention while I was there, or only completing a former invention, I do not know. That is about the substance of what I know about his invention."

Dan Drawbaugh was telling the country folks that he was going to exhibit this electric clock at the Centennial, and he told Holsinger so, who published it. He had too much sense to go there with Bain's clock of 1840, of course. He knew he would be laughed out of the house; but he stuffed his rustics with it, while he was looking out for somebody to buy it; and he found somebody presently, and got their cash for it, and put it in his pocket. The molasses hadn't got sour yet.

There is one use of this "electric key" spoken of on that card which I will explain: This "fire alarm" that this electric key is to be used for is exactly the alarm box we have shown you here; it is used to ring a bell. I don't say that Dan's was shaped exactly like this one; it can be modified ten thousand ways. It is an old Wheatstone contrivance patented in 1848, just as well known in electric circles at that time as the full moon was (complts, ii, 1382). I don't mean to say but that Dan might have made one screw longer or one screw shorter, or hung the magnet nearer to one end or farther from the other. I am not talking about that. I am talking about the thing,—the *machine to make electricity* for the the purpose of signalling. Dan thought it would be a good thing to use on fire alarms in cities; to put one of these keys in each alarm box, and when a person opened the box and gave this magnet a shake. it would send a wave of electricity to the central station, and ring a bell; just as we do now on the telephone boxes when we call up the central station.

Now your Honor sees on that card it was for the purpose of *fire alarms;* but Dan was also wild about putting that key on telegraph lines. He was so ignorant as to suppose that the amount of electricity one could make by his finger would be of any use on a real telegraph line.

The COURT.— No battery?

Mr. Dickerson. — No battery; just a wabble of the magnet. What is got in electricity is the equivalent of the power expended by the finger in depressing the key with much loss however.

Mr. Hill.— I understand Prof. Siemens, then, was similarly ignorant. He had, as you say, invented this electric key: if one was ignorant, the other was.

Mr. Storrow. — He had something else.

Mr. Dickerson. — Yes, he had something else, and that was the Siemens armature.

Mr. Hill. — You don't know what Dan had.

Mr. Dickerson. — We do. He has described it himself. He testified, and he gave a description of it. It was a common horseshoe magnet, hung up on two pivots, that could wabble up and down.

Mr. Hill. — I have seen the motion: I know how it is; that's not exactly the motion.

Mr. Dickerson. — Well, we have your testimony already on other things: you had better not give any more of it here. We will stand upon the record, I think.

Mr. Hill. — He didn't describe it in the way you have described it.

The Court — Do the testimony and your proofs show a description of this machine?

Mr. Dickerson. — Yes, your Honor. Dan Drawbaugh describes it (defts, ii, 980-2, 984; complts i, 793).

Mr. Hill. — And right here I wish to call your Honor's attention to the testimony of Edward Nichols (p. 875, complts' record, x-q. 196 and answer), one of complainants' witnesses — the only one who testified as to the likeness or non-likeness of that machine to the instrument **C**. I think he is the only one who testified on the subject of any supposed resemblance to that exhibit **C**.

Mr. Storrow. — You will find another reference in the brief to the same topic (brief, p. 324).

Mr. Dickerson. — Any one who sees both will see they are generally alike. They have both got big horseshoe magnets with electro-magnets in front of the horseshoe; one has a diaphragm, which is not on the other. The question is, whether a country fellow who saw one ten years before might mistake the one for the other.

Mr. Hill. — He swears that nobody could mistake those two machines; that he would not take one for the other.*

Mr. Dickerson. — You don't suppose you could not get any number of men to swear to that, do you?

Mr. Hill. — He is your witness.

The Court. — His knowledge of mechanism would account for that.

Mr. Dickerson. — I didn't mean to argue such questions at all. I was telling you the big facts; no matter about these details. Dan Drawbaugh took that electric key up to Harrisburg to the superintendent of fire alarms, and put it on exhibition in a shop there, and

---

*As the testimony of Edward Nichols was incorrectly stated, we give his answer referred to, and also the reference in the brief.

Deposition of *Isaac Lloyd*, a school teacher (complts, ii, 1269): —

"*Q.* 51. Please mention something about the construction of the instrument that you saw at the restaurant at Harrisburg for telegraphing without a battery.

"*A.* To the best of my knowledge, it was composed of two magnets — one a permanent one, and the other an electro-magnet — the permanent magnet was balanced on trunnions. The permanent magnet's poles, passing the poles of the electro-magnet, produced an induced current of electricity. This operated the sounder, or an equivalent. Attached to the machine, he had quite an amount of wire — copper, I think. The clicking was produced by pressing on the permanent magnet."

And then —

"*A.* 56. . . . If the magnet on 'C reproduced' was equipoised, it would look very much like the machine for telegraphing without a battery that I saw at Harrisburg. The permanent magnet had trunnions, upon which it was balanced. Its poles passed the poles of an electro-magnet. That machine had nothing like the diaphragm and mouthpiece of 'C reproduced.'"

Edward Nichols testified (complts, ii, 875): —

"*X Q.* 196. Please look at the instrument, Exhibit C reproduced, now shown you, and state whether this is not the instrument which you saw, instead of a call bell for hotels.

"*A.* It is not.

"*X Q.* 197. Could you not possibly be mistaken about it, and have confounded this instrument with the call-bell instrument?

"*A.* I could not; my recollection is very clear about that instrument.

"*X Q.* 198. Does this instrument look very unlike that call-bell instrument, or very like it?

"*A.* It does not look like it.

"*X Q.* 199. In your judgment, could anybody mistake the one for the other?

"*A.* *I could not.*"

They were much alike, though careful and educated men like Lloyd or observant mechanics like Nichols would not mistake them. What Nichols says is not that anybody could not mistake them, but that *he* could not.

Mr. Dickerson. — No battery; just a wabble of the magnet. What is got in electricity is the equivalent of the power expended by the finger in depressing the key with much loss however.

Mr. Hill.— I understand Prof. Siemens, then, was similarly ignorant. He had, as you say, invented this electric key: if one was ignorant, the other was.

Mr. Storrow. — He had something else.

Mr. Dickerson. — Yes, he had something else, and that was the Siemens armature.

Mr. Hill. — You don't know what Dan had.

Mr. Dickerson. — We do. He has described it himself. He testified, and he gave a description of it. It was a common horseshoe magnet, hung up on two pivots, that could wabble up and down.

Mr. Hill. — I have seen the motion: I know how it is; that's not exactly the motion.

Mr. Dickerson. — Well, we have your testimony already on other things: you had better not give any more of it here. We will stand upon the record, I think.

Mr. Hill. — He didn't describe it in the way you have described it.

The Court — Do the testimony and your proofs show a description of this machine?

Mr. Dickerson. — Yes, your Honor. Dan Drawbaugh describes it (defts, ii, 980-2, 984; complts i, 793).

Mr. Hill. — And right here. I wish to call your Honor's attention to the testimony of Edward Nichols (p. 875, complts' record, x-q. 196 and answer), one of complainants' witnesses — the only one who testified as to the likeness or non-likeness of that machine to the instrument C. I think he is the only one who testified on the subject of any supposed resemblance to that exhibit C.

Mr. Storrow. — You will find another reference in the brief to the same topic (brief, p. 324).

Mr. Dickerson. — Any one who sees both will see they are generally alike. They have both got big horseshoe magnets with electro-magnets in front of the horseshoe; one has a diaphragm, which is not on the other. The question is, whether a country fellow who saw one ten years before might mistake the one for the other.

Mr. HILL. — He swears that nobody could mistake those two machines; that he would not take one for the other.*

Mr. DICKERSON. — You don't suppose you could not get any number of men to swear to that, do you?

Mr. HILL. — He is your witness.

The COURT. — His knowledge of mechanism would account for that.

Mr. DICKERSON. — I didn't mean to argue such questions at all. I was telling you the big facts; no matter about these details. Dan Drawbaugh took that electric key up to Harrisburg to the superintendent of fire alarms, and put it on exhibition in a shop there, and had people looking at it; that is in the record. And then Mr. Hill, in his brief, says that the man who wrote that card *couldn't have been Drawbaugh*, because he had said that this key was for "fire alarm," and that *anybody knows* it could not be useful for that purpose.

---

*As the testimony of Edward Nichols was incorrectly stated, we give his answer referred to, and also the reference in the brief.

Deposition of *Isaac Lloyd*, a school teacher (complts, ii, 1269): —

"*Q*. 51. Please mention something about the construction of the instrument that you saw at the restaurant at Harrisburg for telegraphing without a battery.

"*A*. To the best of my knowledge, it was composed of two magnets — one a permanent one, and the other an electro-magnet — the permanent magnet was balanced on trunnions. The permanent magnet's poles, passing the poles of the electro-magnet, produced an induced current of electricity. This operated the sounder, or an equivalent. Attached to the machine, he had quite an amount of wire — copper, I think. The clicking was produced by pressing on the permanent magnet."

And then —

"*A*. 56. . . . If the magnet on 'C reproduced' was equipoised, it would look very much like the machine for telegraphing without a battery that I saw at Harrisburg. The permanent magnet had trunnions, upon which it was balanced. Its poles passed the poles of an electro-magnet. That machine had nothing like the diaphragm and mouthpiece of 'C reproduced.'"

Edward Nichols testified (complts, ii, 875): —

"*X Q*. 196. Please look at the instrument, Exhibit C reproduced, now shown you, and state whether this is not the instrument which you saw, instead of a call bell for hotels.

"*A*. It is not.

"*X Q*. 197. Could you not possibly be mistaken about it, and have confounded this instrument with the call-bell instrument?

"*A*. I could not; my recollection is very clear about that instrument.

"*X Q*. 198. Does this instrument look very unlike that call-bell instrument, or very like it?

'*A*. It does not look like it.

"*X Q*. 199. In your judgment, could anybody mistake the one for the other?

"*A*. *I could not.*"

They were much alike, though careful and educated men like Lloyd or observant mechanics like Nichols would not mistake them. What Nichols says is not that anybody could not mistake them, but that *he* could not.

The defendants' brief, p. 293, says of this card: —

> "It was evidently written by Holsinger, and not by Drawbaugh, as appears . . . from the inaccurate description of the magneto-electric machine as a machine for 'fire alarm and propelling electric clocks,' with neither of which did it have anything to do, nor was it applicable to them in any way."

Mr. Hill. — It ought to be said that city telegraphs on that principle are in use now.

Mr. Dickerson. — There is not such a thing existing in the world.

Mr. Hill. — I can easily satisfy your Honor on that.

Mr. Dickerson. — I am not discussing that point. I have no doubt that you can put a magneto key on a wire and send a signal ten miles; but to talk about the use of it on practical telegraph lines is absurd. Dan had no idea of the immense electro-motive force required to do that. What electricity one can make with his fingers is of no more use there than it would be to whistle jigs to a milestone; yet, of course, a *signal* can be sent over short wires; and in every city they are doing it to-day, on all these telephone alarm boxes.

Mr. Hill. — Will you allow me to look at your card for one moment?

Mr. Dickerson. — Do you think it is a forgery? It gives me great pleasure to hand it to you.

Mr. Hill. — No, I do not think it is. [*Reading from card:*] "Magneto-electric machine, for *short-line* telegraphing."

Mr. Dickerson. — Of course it is for short-line telegraphing and for fire alarms. Its use for the fire alarm I am talking about.

Mr. Storrow. — Similar things were tried on lines years before and given up.

Mr. Dickerson. — And Dan put it on his card, and for fire alarms. That "fire alarm" is going to be very important soon, and that is the reason I now call your Honor's attention to it so particularly. This magneto-key question is stated in the brief, pp. 322–4.

Now, we have made our digression from Hauck, in 1873, and I will go back on the track of this genius as he marches from adversity to fame.

In 1875 was formed the Axle Company. The details and references are in the brief, pp. 259–266, 501–510. The articles of association were signed in the last of December, 1874, and the company went into operation in the spring of 1875. They went to Eberly's Mills because of Dan's fame as a machinist, in the spring of 1875; and out of the Axle Company I am going to DEMONSTRATE THE UTTER FALSITY OF THIS PRETENCE.

The Axle Company got their machinery in March or April, 1875, and began in that spring and summer to make patent axles, invented by a man named Kline; and they employed Dan as their master machinist, to run the works. Up to that same room — forty by twenty-five — the Axle Company, in order to segregate their work, put a staircase on the end of the building outside.

The COURT. — Did they succeed Hauck Brothers?

Mr. DICKERSON. — Yes, sir; they succeeded the Hauck Brothers, and went in in March or April, — somewhere along there, — in 1875, having formed their partnership in December, 1874.

It was composed of four persons: Kline, the inventor of the axle; Capt. Moore, the capitalist; Grove and Bear, — four men.

Capt. Moore was the only man who had any money in the concern, as it seems. Capt. Moore was a very intelligent man. He is one of the only two men of education that have got on their side — I mean above the class of people that work with their hands for a living — almost that. That may not be strictly true, but it is substantially true. Certainly they are the only two witnesses of any importance who belong to the category I have mentioned.

That company went there because of Dan's reputation as a machinist. He drew for a long ways around him. They went there and put in their machinery in his upper story, and then built their staircase from outside, so that they would not be required to go through the lower story, which was used by the Haucks. The Haucks at that time had left their machinery there unused; and they kept moving it from time to time. They got out of business practically in 1875, and they moved their machinery to another place; but some of their machinery was left up to 1877, I should think, although they were practically out of business. The molasses-spigot business, or the rotary-pump business, was a failure, and they were just getting their things out.

This new Axle Company went up to the second story, which was Dan's own shop, where his own machinery was, and where his own personal room was, — a twelve-foot room; and they put a staircase up at the end of the building and made an entryway between the two rooms.

The COURT. — I remember the sketch. (App. p. 886.)

Mr. DICKERSON. — There were two small rooms, with an entryway between them, and the rest of the floor was all one, and the staircase was all outside. That came into existence in the spring of 1875, that particular structure; and it nails down several of their witnesses, who swore to seeing telephones in those particular rooms before the time when they were made. That is a stumbling block that trips up several of their witnesses, or more than one; I am not going to use extravagant terms. That was put there in 1875.

Mr. HILL. — It tripped up Mr. Bayler, for example.

Mr. DICKERSON. — *Yes, it did trip up Bayler*, it did just that to Bayler; but I am not going to stop and pick him up. He is microscopic. I am going to a subject that is big.

Now, sir, at that time, — in the spring of 1875, *according to the testimony*, — Drawbaugh had **D** and **E**, a pair of perfect Bell magnetos, according to both Bell's patents of 1876 and 1877. He had **D** and **E** in February and January, 1875. That is the testimony. Of course he had all the antecedents of **D** and **E**, — **C** and **I** and **A** and **F** and **B**; but he had **D** and **E**, and that was the culminating point of Dan's work on magneto telephones.

D and **E**, your Honor knows, contain all the inventions Mr. Bell made on telephones, excepting his variable-resistance transmitter, which is another way of carrying out his invention. But all his magneto-telephones are summed up in **D** and **E**. They are the same thing as this black-handled machine, which is now in common use. The only difference between them is that the black-handled machine has a long permanent magnet in the handle, and **D** and **E**

have got it curled up flat. The difference is one merely of convenience in handling one or the other, and in **D** and **E** it is too small.

Therefore, your Honor, in the Axle Company's room, or in that compartment of it in which Drawbaugh had his own tools in the corner, were all these things from **D** and **E** backwards, — **D** and **E** and **A** and **C** and **I** and **B** and **F.** Not only were they all there, but they have got a fellow to swear that the place was strung full of them, — a man named Decker, — piled up all around, like a harp with a thousand strings. Every time he went to that room in 1875, — to that Axle Company's shop, — there were more and more and more, and better and better, and Dan had them strung all around the room with wires to the cellar.

And now I will make your Honor acquainted with Capt. Moore. If he doesn't crush this case into impalpable powder, it never can be done by logic. Capt. Moore was an intelligent man. He was a teacher of a school, — a soldiers' orphan school, — which is assisted by the State, and which was owned by Capt. Moore — a man of intelligence and a man of integrity, a man against whom I have nothing on earth to say; and I should have called him as our witness if I had known what he could swear to, and the other side had not already called him.

Capt. Moore began business at Drawbaugh's shop in March or April, 1875, and stayed there until after November, 1876. He sold out his school and put his money into axles, relying upon Dan's skill in carrying out his work. *He* got stuck on the molasses too.

Mr. Hill. — Where is that testimony about his leaving his school? I don't remember about his selling out his school.

Mr. Storrow. — It is on p. 653 of defendants' Vol. I.

Mr. Dickerson. — Why on earth do you want to refer to that? But read it, Brother Storrow.

Mr. Storrow. — (*Reading:*) Moore's deposition, defts, i, 653: —

"I assumed control of it [the school] Nov. 1, 1867. The building belongs to me, and the State pays me a certain sum *per capita* for all expenses attending the maintenance and instruction of the scholars. From March 1, 1875, to March 1, 1877, I sold my controlling interest to another party, and resumed it again at the latter date."

Now, sir, Capt. Moore went to Drawbaugh's shop in the spring of 1875, and stayed there until Nov. 18, and somewhat after — certainly to Nov. 18, 1876. That is the date of the final dissolution of his firm. Our patent is March 7, 1876. He was the capitalist. He left his school, and went there to devote himself to making Kline axles, with Dan Drawbaugh as his machinist and employé.

But, your Honor, the present testimony is, as you see, that the culminating point on magnetos had been reached in 1875 — January or February, by **D** and **E**; also that those things never went out of that room. They were all there. Capt. Moore was in profound sympathy with Dan. He is the brother-in-law of Bowman, one of their principal men in getting their proofs; and you will find that his testimony was given in deep sympathy with the whole crowd. Whatever he swore to he swore to *as well as he could for Dan.*

Mr. Hill. — The brother-in-law of Bowman, did you say?

Mr. Dickerson. — Yes; the brother-in-law of Bowman.

Mr. Hill. — Bowman is the justice of the peace who swore some of the witnesses.

Mr. Dickerson. — Well, you had him travelling around the country with you taking testimony, — taking *ex parte* affidavits.

I want your Honor's careful attention to this, for it demolishes this case, in my judgment, as effectually as if it never existed. If it doesn't, then "judgment has fled to brutish beasts and men have lost their reason."

Will your Honor be good enough to turn to defts, i, 650, where they called Capt. Moore to prove that Dan Drawbaugh applied *to him for money to patent his invention.* He is one of the persons who refused Dan when he was begging for money; and they called him to prove it. At the top of that page (650) he says, — look at that question, your Honor: —

"*Q.* 22. *About when was it, as near as you can remember*, that he first showed you his *talking machine?*"

Now, of course, they had been talking to this witness, and had prepared him; and the best question they had to ask him was, "*About when . . . as near as you can remember?*" That is all the criticism I care to make upon any answer of his that relates to time.

"*A.* It was during the month of May, 1875.

"*Q.* 23. Did he say anything about patenting the machine at that time; if so, what?

"*A.* He did; he said that he was unable to procure a patent himself, and desired me to go in with him and get a patent for it.

"*Q.* 24. Did he offer an interest in the invention to any one who would go in and get a patent?

"*A.* Yes; he was anxious to have some one take hold of it with him who had the means to procure a patent and put it on the market; I was so fully engrossed with our own patent," and so on.

"*Q.* 25. At that conversation with Mr. Drawbaugh, *did he or not suggest any particular line of business in which he thought the talking machines could be introduced?*

"*A.* HE SPOKE OF THE USE OF IT IN CITIES TO SUPERSEDE THE FIRE ALARM WHICH EXISTED AT THAT DAY."

That answer and that question are certain death, — "He spoke of the use of it in cities *to supersede the fire alarm which existed at that day.*" There is Dan's card of the year before advertising this "magneto key" to supersede the fire alarm; there is the testimony of Mr. Kiefer that Dan came to Harrisburg to get him to introduce it on the fire alarm. And then, may it please your Honor, Dan Drawbaugh isn't an idiot; he didn't tell a man that a telephone was a "*fire alarm*"; for a talking machine requires a fire alarm alongside of it to alarm the listener. Dan's fire-alarm key is always placed along with it to attract the attention of anybody that is going to use it, without which it would be useless. For the key, see brief, p. 322.

Isn't it certain as death that the thing he asked Capt. Moore to invest his money in was the fire-alarm key that he had been begging around the country to get used, and to get advertised? Of course it is. I suppose no one in his senses will argue that that *tin can* was going to be a fire alarm, or that Dan said so. Capt. Moore, five years after the event, simply doesn't remember the *thing* on which Dan applied to him for aid; he, however, did not forget *the purpose* of the thing, and that does not fit the telephone. But let us go on. Here, sir, is their next question to Capt. Moore. I beg your Honor's attention to it now, because this is a critical and fatal question which they put to him: —

"*Q.* 26. Please look at the machine **B**" [that is the old tin can of 1867, as they say], "now shown you, and state whether or not he showed you *that machine* IN CONNECTION WITH THAT CONVERSATION."

They don't ask whether he showed it to him *as the thing* that was going to *supersede the fire alarm*, but only "*in connection with that conversation.*"

"*A*. I believe this to be the exact machine which he showed me *during that conversation*."

That was adroit. Now, your Honor, consider that question. Dan says to Capt. Moore, "Look at **B**. Isn't that the thing I showed you?" He himself knew whether it was or not, and he put the fact to the witness and asked him to assent to it, and he did: "Yes, **B** was the thing."

Now, may it please your Honor, at that time Dan had **D** and **E**, a *perfect Bell telephone*, and all these antecedent things, if this present story be true. He was applying to Capt. Moore, according to the present theory, to help him patent the telephone; and what did he show him? He showed him that old *tin can*, which they want you to believe had been made in 1867, and which Dan Drawbaugh has since sworn had been *given up, and had gone out of use years before that day*,—years before that day,—gone out of use as soon as he had made a better one; and yet he showed that to this man as the basis of an application for money to obtain a patent for the speaking telephone in 1875-6.

I haven't done with them yet, sir. Capt. Moore says, "I believe this to be *the exact machine* which he showed me *during that conversation*."

"*Q*. 27. Do you recollect whether or not the end of the box next to the magnet was closed at the time of that conversation?

"*A*. *It was closed with something thin, like a bladder, drawn tightly and tied around it like a drumhead.*"

That is, it was in working condition with the bladder on. That bladder, may it please your Honor, Drawbaugh said when he swore about this **B**, had been eaten off years before in the garret, and never had been put on again.

Mr. Hill.—No, he doesn't say anything of the kind. Take Mr. Drawbaugh's testimony throughout his deposition and read it.*

Mr. Dickerson. — [*Continuing to read:*]

"*Q*. 28. Do you remember whether or not, while you were engaged in business there, he had *other talking machines around in different parts of the shop?*

---

* See the deposition on this point quoted in complainants' brief, pp. 154-5.

"*A.* *I never saw any in use.* I saw a number of pieces of wood that were carved out in different shapes. I never had any conversation with him as to their use.

"*Q.* 29. Did you feel much interest *in his talking machine* at the time?

"*A.* I did feel considerably interested in it, and told him if it could be put to practical use it would be a fortune to any person or persons who would succeed in bringing it out. I can't remember the words exactly, but that is about what I said to him.

"*Q.* 30. Did you take interest enough in it to inquire about it afterwards, or to examine any of the machines that you saw lying about there?

"*A.* I observed him frequently working at machinery that I thought was connected with this same machine, though put up in different styles and different shapes. I was not well enough acquainted with his objects at which he was at work, nor his designs, at the time, to give an intelligible account of their working, or what they were for. *I made inquiry of him as to the purpose of a machine that was on a table in another room, which worked by a magnet, and pressed certain keys with the alphabet on,"* — that was the alphabet telegraph, your Honor, — "but I don't know the object of it now; I didn't examine any one that had reference to this talking machine."

"*Q.* 31. Are you now able to identify any of the machines that had reference to this talking machine, other than the instrument **B** now lying on the table before you?

"*A.* I do not think I could recognize any other.

"*Q.* 32. When Drawbaugh *spoke of using the talking machine* as a substitute for the fire-alarm telegraph, did he state how he thought of using the machine," — look now at this question — it is certain death, — "whether by batteries or by magneto electricity?

"*A.* He spoke of using it as this was used, *by an electro-magnet; this is the expression I understood him to use, — magnets.*"

Mr HILL. — There was an electro-magnet on the machine.

Mr. DICKERSON. — Isn't this as certain as death — that Drawbaugh talked to Moore about his *key* as the subject of his application — the key that was to work by a magnet without a battery, and to be used for a fire alarm? Capt. Moore is an honest man. I believe he meant to tell the truth. But Drawbaugh showed him **B**. When did he show him **B**? When? Was it in May, 1875? He doesn't say so. "I want you to guess, as near as you can, when you saw it." That is all they asked him. But, whenever it was, there was *no talking through any machine* in Capt. Moore's presence; and yet, long before he left that place, even as early as August, 1876, Dan had not only

D and **E**, but the "Blake transmitter" in that room,—if the present testimony is to be believed,—and never showed any of them to Capt. Moore, his friend and employer, to whom he was applying for $50—only $50—to get a patent on his telephone; and before Capt. Moore left there, Bell was famous all over the world.

Now, sir, I will show you presently when **B** came into existence. *It came into existence in* 1876, *when Capt. Moore was there.* But Dan didn't talk through any machine to the man to whom he was applying for money to patent it when he had **D** and **E** on the table, which needed no battery, which he could pick up and connect the wire across the room and talk through them, if you believe him. Isn't it as certain as any moral certainty that at that day and hour he had no talking machine that he could show Capt. Moore? He had no talking machine, or he would have talked through it. He didn't have **D** and **E**.

Now, may it please your Honor, I might concede for the purpose of the argument that he showed Capt. Moore that tin can as early as May, 1875, and isn't their case gone? That is all he had in May, 1875,—all he had to show. But he had **B** at *some time* when Capt. Moore was there. When the partners went to Capt. Moore and raked up his memory, he remembered what the object of Dan's solicitation was—to supersede the fire alarm. He also remembered the tin can; he remembered the alphabet telegraph,—those things he remembered. He remembered that Dan asked him for money for *something*, and he describes what *that something* was to do; which shows it was not a talking machine; evidently it was the key, because he describes what it was exactly,—it was to supersede the fire alarm. That is what he talked about the money for.

Now, may it please your Honor, I will do Capt. Moore the justice to say that he does not fix the date of any of these things. If **B** was there at any time when he was there, his testimony is perfectly consistent and straight, and it demolishes this defence,—it gives the lie to their story. There is the card; there is the fire alarm; there is the application in Harrisburg to have the key put upon the fire alarm of that city; there is Capt. Moore.

That conversation with Dan must have occurred in 1875 or 1876. When did he testify? Five or six years afterwards. No man can tell whether it was in the month of one May or in the month of next

May— five or six years after — when he heard a man say such a thing; nor does Capt. Moore attempt to fix it. I think it is not necessary to argue that: our every-day experience proves it to ourselves. I can't, — your Honor can't, — and nobody can. Given the scope of that year for the captain to have seen those things in, and this case is demolished beyond the power of the resurrection horn to raise it.

D and **E** were not in that room. None of those other things were in that room; none of them, sir. Capt. Moore didn't talk with Dan through any of them when Dan went to him to get money. Dan said to him, "I want to supersede the fire alarm, and here is the machine that will do it." Capt. Moore said, "No, I don't want to go into that business." That is the story and it is true. Imagine a man of Capt. Moore's intelligence shown, in 1875, *the perfect Bell telephone of to day*, and not speaking in it!

I am going to fortify Capt. Moore's story by several witnesses on both sides. But if his story stood alone and I sat down now, I should feel the most absolute confidence that the defence was dead on the testimony of Capt. Moore. That was Dan's own question,— "*Didn't I show you* **B** *with a bladder on?*" That was his own assertion, — that he never showed Capt. Moore any other. And that tin can Dan *swore he never used after he got it superseded by the improved receivers* **C** *and* **I**, as, of course, he never did. Why should a man use a battered tin can and a piece of old board, when he had got the *same machine exactly in a perfected and improved form*, which he swore was much better than **B**, — Dan swore it was much better than **B**, and that, when he got it, he no longer used **B**, of course? He said that he *showed* it to people sometimes; merely to show what he had done; that he brought it down from the garret with the bladder eaten off, and *showed* it to them, but that he never *used* it. (Brief, pp. 153–5.)

Now, may it please your Honor, this is their witness, — *their witness.*

But I will go a little further, sir. They put a man by the name of Springer on the stand.

This man Springer testifies (defts, i, 190): —

"*Q.* 2. Do you know Daniel Drawbaugh?
"*A.* I do,"—and so on,—"I have known him about eight years."

"*Q*. 3. Did you, at one time, reside at Eberly's Mills?" This is their witness, not ours.

"*A*. I commenced there *April 1, 1876*, and moved away about the 6th or 7th of January, 1877." He was there during the critical year, during the great exhibition year. "I just rented a shop and went there to work, boarded myself and lived there; my family stayed at Andersontown.

"*Q*. 4. While so living at Eberly's Mills, did you or not frequently visit the shop of Daniel Drawbaugh?

"*A*. Yes, sir; *about twice a day, noon and evening*."

"*Q*. 5. During that time did you see there what he called a talking machine?

"*A*. Yes, sir; that is what caused me to go down there pretty much every time I went.

"*Q*. 6. Did you go down to assist him about talking on it or operating it?

"*A*. He boarded with his brother just above me." (Your Honor will remember that in that year, 1876, Dan had moved his family up to Mechanicsburg, six miles off, and came down to his shop by rail, and went to his brother's for his meals.) "And he stopped still after dinner, and I said, I will go along down and we will talk through that machine. *I told him it was a curiosity to me*."—I should say it might be, your Honor.—"I wanted to talk with him through it."

"*Q*. 7. During the time that you lived there, as you have stated, did you see more than one talking machine? If so, how many, to the best of your recollection?

"*A*. I saw these six that lays here (*indicating* **B**, **F**, **D**, **E**, **G** *and* **O**); *these two are the first we talked through* (*indicating* **B** *and* **F**)." "These two are the first we talked through."—He went there April, 1876. These two, **B** *and* **F**, *were the tin can and the broken tumbler*.

"*Q*. 8. How soon after you talked through **B** and **F** did you talk through any of these other four," and so on.

"*A*. *It was about two months*, or as near as I can tell you, that he *had these two*, **D** and **E**."

For two months, your Honor, Dan and Springer talked through the *tin can and broken tumbler* after April 1, 1876; and the tin can and broken tumbler were the instruments of 1867 which had been superseded long years before, as Dan himself swears, but which now appeared in working order—**B** alone, by the testimony of Capt. Moore, their witness, and **B** and **F** by the testimony of Springer, their witness.

Springer's testimony, on the whole, is not true, but he is their witness; they proved by him that Dan and he talked through **B** and

F from April to June, 1876, morning, noon and night, and then what happened? Then **D** and **E** emerged. This witness is, of course, one of those animals that has been stuffed for this case; but they did not stuff him right. He was an early witness before their schedules were all made out.

"*A*. 8. It was about two months, or, as near as I can tell you, that he had these two, **D** and **E**, or two exactly like them; *he told me then that he had improved the machine; that he could talk both ways then.* Then I went along down; the first we had we could only use to talk in one direction."

Here in the summer of 1876, after our patent, first appeared something to supersede **B**, the tin can. That was **D** and **E**, says the witness, which, they had attempted to prove by some other witnesses, *were made in January*, 1875. They were not there when this man went there; they appeared afterwards. And then they put **A** to him,—that round thing with the mouthpiece at one side. "Did you see that?" "No," says he, "*he must have got that after I left;* I don't mind of seeing it" (ans. 33, defts, i, 193). Now that is their other witness.

Mr. Hill.—Will you read this witness's answer 64, p. 197?

Mr. Dickerson.—Yes, sir, I will read anything you say. I always find it advantageous.

The Court.—I don't think it advisable to take time to read it, if the proof is referred to in your brief.

Mr. Dickerson.—But I always like to gratify Mr. Hill, you know.

The Court.—Of course, I understand that Mr. Dickerson takes up the record and makes the suggestions that are desirable for him to make in the way of argument.

Mr. Hill.—I beg your Honor's pardon for making any interruption at all, but, when the testimony of the witness *is not correctly* quoted, I think it worth while to call your Honor's attention to it.

Mr. Storrow.—That particular answer is quoted in our brief.

Mr. Dickerson.—Since we are charged with misstatement, I am going to read it (defts, i, 197):—

"*Q*. 64. Do you remember *their appearance* when you first saw them, and if so, did they look as if *they had just been made, or as if they had been made some time?*

"*A. They looked about as old as they do now; as if they had been made a long while. I am satisfied they were not made new.*"

That is, D and E, when he first saw them he thinks *looked* old.

The partners were in trouble, with D and E *just coming into existence in midsummer, 1876!* and Mr. Hill says to him at *the next session*, "Now, my good fellow, this won't do. Didn't they look just as old as they do now?" "Yes, just as old."

That is what Mr. Hill wanted me to read, and I read it to your Honor with pleasure: it was the best they could think of.

Now, sir, at that day and hour, — *August*, 1876, *we are talking about*, to which Springer had testified, — what did Dan have there, if the present story is true? He had the "Blake transmitter" and a number of antecedent microphones. Aug. 15, 1876, he had the "Blake transmitter" H finished. They have sworn to it solid, and they have put it in their brief that it was so. It was the high-water mark, Aug. 15, 1876, when Dan had the Blake transmitter. They also had these half dozen microphones, and they tell your Honor (and they tell you truly) that the inventions contained in those instruments are the inventions that were made *by a "hundred men"*; and Mr. Hill, on his feet here, told your Honor, with that satisfaction which any man naturally would feel if the fact were so, that his partner in a few weeks had created out of the recesses of his own brain a set of inventions that had taken a hundred other men, independently of him, to make, and which were the most startling, — he has had it so sworn by his attorney witness, — the most startling that have ever been made. What a pleasure it must be to him to contemplate in his embrace a genius like that! He told your Honor that his partner had done it all; and he evidently prided himself that he even lived in the shadow of so great a being.

Now, sir, Dan had those things, according to this testimony, when this man Springer was there; and yet they were talking two months through the old tomato can; and then D and E appeared, — and he never saw the Blake transmitter H nor A, — he says he didn't; and it was all within a room forty by twenty-five. And yet another witness, Decker, comes and tells you that that very room was strung over with them, piled up all around the wall.

But I haven't quite finished with them yet. There is a man named

Dellinger, whom they put upon the stand. There must be some mistake about the way he spells his name; it ought to be spelled Derringer: that is a kind of tool that is certain death to anybody it is aimed at. They put this man on the stand; and he is another fellow that went in there in 1876. (Dellinger's testimony, defts, i, 459.)

Your Honor remembers that **D** and **E** have got the "curled magnets" in them. (See brief, pp. 454, 471, 479.)

Mr. Hill. — And several other later machines have also.

Mr. Dickerson. — I like to have that issue made here. I am glad of it. Thank you again. Several other machines, Dan's partner says, have curled magnets. I am much obliged to him. I shouldn't have made it so emphatic otherwise.

Mr. Hill. — Several other *later* machines, I said.

Mr. Dickerson. — I don't care which way you put it, later or earlier, it suits me equally. *There are not "curled magnets," or anything like them in any later machine.* But your witness Dellinger fixes it (defts, i, 471): —

"*X Q*. 136. What instruments did you see him work on?"
"*A*. I seen him work on woodwork and on *these* curled magnets (*taking up* **D**)."

He went there, your Honor, in the spring of 1876, and stayed there until April, 1881, after we began to take testimony in this case.

Mr. Hill. — He was the miller in the grist mill.

Mr. Dickerson. — Yes; he is one of the kind of witnesses you have got, — these visitors. But let us hear Dellinger: —

"X *Q*. 133. In your forty-fifth answer you say, 'His whole heart and desire was on the telephone': what made you think his whole heart and desire was on the telephone?
"*A*. Because he always talked to me about it, and experimented on it.
"X *Q*. 134. Were you with him when he was experimenting or working on the instruments?
"*A*. I was in the shop.
"*X Q*. 135. Did you see him experimenting with them or working on them?
"*A*. I seen him work on them, — not experiment, but work on them.
"*X Q*. 136. What instruments did you see him work on?
"*A*. I seen him work on woodwork, and on *these curled magnets*

[*taking up* **D**] also on these wires. He had a machine that he was working on that was putting thread or something on the wires; I don't know what it was.

"*X Q*. 137. When was it that you saw him working on the curled magnets?

"*A*. THAT I AM NOT ABLE TO SAY.

"*X Q*. 138. Can't you tell whether *it was during the first year*, 1876, *or some of the later years?*

"*A*. I DON'T REMEMBER.

"X *Q*. 139. Do you remember *what he was doing on the curled magnets?*

"*A*. *He was working on them with a file, if I mistake not; he had a tool, anyhow, that he was working with.*

"*X Q*. 140. Did you see what he did with them after he had done working on them?

"*A*. *He fitted them into the wooden boxes here, on* THIS PIVOT [*illustrating with machine* **E**]."

They were screwed down on their pivots, — those curled magnets, — **D** and **E**, — *no other machines* are so made. It was after he went there, 1876, how many years after, he don't know, when he saw Dan filing and fitting up that curled magnet. I am happy to have that suggestion from Mr. Hill, because it emphasizes the witness,— not some other curled magnet on some other machine, *but this one here*, **D** *and* **E**; and Dan was screwing it fast *on that pivot*. "I saw him do it." That is their witness. Will they ask your Honor to turn him out of court, and say he doesn't tell the truth? They must not ask you to do that. His testimony is true. Dan was doing that in 1878.

Now, may it please your Honor, Dan Drawbaugh swore about this, and I think it is the only answer in his deposition that is absolute, double twisted and clinched on the other side. Almost every other answer he ever made is, "I don't know; my memory is bad; I can't tell; it might be so or it might not; I don't know anything about it. I am a poor wretch, that don't know anything." But here he came up to the mark, because he thought he could say something good. He wanted to fix **D** and **E**, not as *experiments*, but as perfected, unaltered things.

They asked him the direct question (defts, ii, 1107): —

"*Q*. 1700. State whether or not you *ever changed the magnets or electro-magnets on the small magneto instruments and* **E** *after their construction*."

They didn't want to see those things ever go to pieces again; their witnesses swore them back to January and February, 1875, — *although Drawbaugh never did or would*, — and they didn't want to see them ever go apart again. It was the first practical machine Dan ever had, and they must hold on to it.

What did the virtuous Dan say?

> "*A.* No, sir; I did not. *I know I did not on them. I am positive I did not;*" — twisted it up three times and riveted it,— "I had made some little changes in diaphragms,— sometimes thicker and sometimes thinner diaphragms, — and I had made the interior larger,— turned out a recess in one of the instruments; *that is all the change I can remember of.*"

Now he riveted it in, swore it solid, because it was necessary; and *after* 1876, — how many years after the witness can't tell, — they prove by Dellinger that Dan was filing, and finishing, and fitting up and putting in those curled magnets into their boxes (see brief, p. 495).

That dispensation of Providence that I mentioned in the early part of my argument; how it appears every moment!

Now, may it please your Honor, I am going to show you where all this came from. In 1876 Dan Drawbaugh was living at Mechanicsburg, as I have mentioned to you, having gone there on the first day of April of that year, 1876, and having returned to Eberly's Mills on the first day of April, 1877. In Mechanicsburg was a man named Shapley, a clock maker by trade, and a very intelligent man, as your Honor will see when you read his deposition. Dan was trying to get him into that wonderful clock of his; and he did, too. The molasses stuck him. He didn't know anything about electricity, but he thought it would be a great thing to get a clock that would never want winding: and Dan was hanging around him to get his money. He had two thousand dollars in cash, just lying loose, that he wanted to put into something. He was an enterprising fellow, a good mechanic, and Dan nosed that money out and went for it.

Mr. Shapley was a subscriber to the *Scientific American*, which he says Dan Drawbaugh read in his shop constantly. *On the ninth day of September*, 1876, appeared an article in the *Scientific American*. It is the other side's exhibit. I think they call it Vol. IV., defendants' exhibits, p. 131. If you will be good enough to look at it, you will find it good reading: —

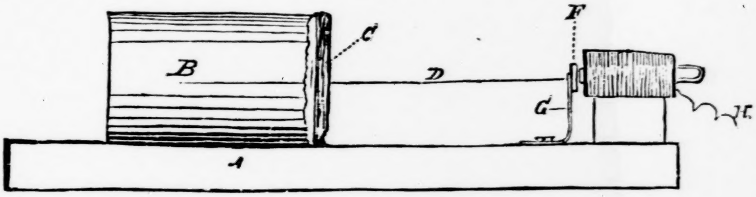
> "Several weeks ago we gave a sketch and description of the thread telegraph, consisting of two small tin or wooden cylinders, *each having a membrane stretched over one end, the two membranes connected by a stout thread.* Two persons may readily communicate the sounds of the voice by means of these instruments over a thread fifty or a hundred feet in length. The person sending speaks within one of the cylinders, which causes the membrane to vibrate; the vibration passes along the stretched thread to the membrane of the other cylinder, which being held to the ear of the person receiving the message, the vibration is duly heard, or, in other words, the voice of the sender is made audible."

This is an introduction to an absurd description of the Bell telephone. The chucklehead who wrote it didn't know anything about his subject: —

> "Prof. Graham Bell, by a *device somewhat analogous*" — that is good — "has succeeded in transmitting the tones of the human voice by telegraph. *Instead of the thread, he connects the membranes of the* TWO CYLINDERS OR DRUMS *with the armatures of the electro-magnets*, one drum being placed at each end of the telegraph wire. In fact, he not long ago demonstrated the possibility of conveying vocal sounds by means of the ordinary telegraph wires and special appliances for transmitting and receiving the sounds. The apparatus used by Prof. Bell is thus described: two single-pole electro-magnets, each having a resistance of ten ohms, were arranged in circuit with a battery of five carbon elements, the total resistance being about twenty-five ohms. *A drumhead of gold-beaters' skin about two and three quarters inches in diameter was placed in front of each electro-magnet, and a circular piece of clock spring was glued to the middle of the membrane of each drumhead.* One of these telephones was placed in the experimental room and the other in the basement of an adjoining house. Upon singing into the telephone, the sounds of the voice were reproduced by the instrument in the distant room; and if two persons simultaneously, the two notes were audible at the other telephone," and so on.

That is all I want to read about it. It is an absurd description of Bell's invention; but it is a description of *two tin cans*, in which the string of the ordinary lovers' telegraph, as it used to be called, was substituted by a wire; and I ask your attention at p. 131 to this very inaccurate but very suggestive language: "*Instead of the thread, he connects the membranes of the two cylinders or drums with the* *armatures of the electro-magnets.*" That is a very stupid description; but it gives the idea that the thread is used to connect the armature to the drum.

Now, sir, in defts' proofs, Vol. II. p. 794, is the picture that Dan put in as his first experiment.



Look at that thing. There is the tin can **B**; there is the drumhead upon it; there is the string; there is the armature of the electro magnet, connected to the drumhead by the string, as suggested in the article. That is the first thing he did; but there was no sense in using that string,— it evidently came out of the *Scientific American.* He had that *Scientific American* in September, and I will show you when he first produced the tin can in public.

Dan says the first thing he did was this string thing. Our witnesses never saw that; but he says so, and I suppose it is true, — it is a plain suggestion in the paper; but no one would keep it long. He would omit the string and attach the armature directly to the bladder. At that time Dan was drawing Shapley into his net, and Shapley went down with him to his place to see his clock, and he was there in the first week of October, 1876 (complts, i, 588).

Dan had the *Scientific American* of September, 1876, giving an incorrect account of the Bell telephone, but describing it as two *tin cans* with diaphragms on them, and magnets. Dan was then negotiating with Shapley to get his two thousand dollars for his wonderful clock; and Shapley had given him these newspapers. He was frequently at Shapley's shop, reading these papers. Dan had one or more of these wonderful clocks at his shop, and Mr. Shapley went down to see them; because he was not going to buy a pig in a poke, and he travelled five or six miles from his own shop, in the town where he and Dan lived, to Dan's shop, at Eberly's Mills (brief, p. 203).

On the 3d of October, 1876, Mr. Shapley and Dan Drawbaugh went down from Mechanicsburg to Dan's shop to see the clocks, and then Dan showed him that tin can **B**, which he identifies and has described (complts, i, 589): —

"*Q*. 22. Can you name any other machines which he showed you at that time?

"*A*. We saw several bells which were rung by electricity, and *an alphabetical telegraph and an instrument he called a telephone.*

"*Q*. 23. Where was this instrument he called a telephone, and how came he to show it to you?

"*A*. The instrument was lying on a table near the clock, in the same room.

"*Q*. 24. Can you give any description of this instrument as you saw it on that occasion?

"*A*. I suppose the board might have been twelve or fourteen inches long, by about five inches wide, and an inch thick, with a *tin can* on about three inches in length, and perhaps two inches and a half in diameter, fastened to the board with a band. The can was lined with plaster of paris, and had *a membrane over it* and *an electro-magnet* to it.

"*Q*. 25. Was it connected with any other instrument, or with the table or building, in any way?

"*A*. Not at the time I saw it.

"*Q*. 26. What, if anything, did Mr. Drawbaugh say about this instrument when he showed it to you?

"*A*. I understood Mr. Drawbaugh to say that he had it up around the shop.

"*Q*. 27. Were there any wires connected to it at the time you saw it at that visit?

"*A*. There was not.

"*Q*. 28. Did he say anything to you about any use that he had made of it, or about what use might thereafter be made?

"*A*. I think I understood Mr. Drawbaugh to say that they had spoken with it, but I do not remember that he made any remark about any use that should be thereafter made of it.

"*Q* 29. Will you look at the instruments now on the table before you marked **F**, **B**, **D**, **E** and **A**, and state whether you recognize either of them as being the instrument that he showed you at that time, or like it?

"*A*. This is it (taking up instrument **B**). I recognize it as being like the one I saw; I do not remember of seeing **A** nor **D** and **E**; I don't really remember of seeing **F**.

"*Q*. 30. State whether or not Mr. Drawbaugh said anything to you about having any other instrument which he called a telephone, except the instrument you have already described, or whether you saw any other instrument there which he called a telephone?

"*A.* I do not remember that he said he had any other, nor do I remember seeing any other."

"*Q.* 41. Did you, at any subsequent visit, see the instrument marked **B**, or either of the other instruments to which your attention has been called?

"*A.* I think I saw this instrument, **B**; it was lying, I think, at the same place. I did not see any others that I recollect."

Now there, in the month of October, 1876, Dan had got the *Scientific American* containing the "tin-can" description of the Bell telephone, and he was negotiating with Mr. Shapley for his money. Mr. Shapley went down to his shop and saw this thing; but Dan never said to Mr. Shapley, "Here is a thing I have invented, and I want you to go into it with me." He showed it to him as a "*telephone*," an invention that had at that time been published not only in the *Scientific American*, but largely everywhere in the world.

Let us turn to Mr. I. D. Landis, the person who was with Mr. Shapley. He was Shapley's companion on that occasion, and also himself a clock maker. He testifies (complts, i, 609) : —

"*Q.* 28. Will you describe as well as you are able the telephone which he showed you? State where it was, and what Mr. Drawbaugh said with relation to it.

"*A.* It was in a room to the left on entering his place by the stairway, nearly opposite the door going into the room. My recollection of it is as being made of tin, — apparently a tin can, — with *a piece of bladder across the end* of it, with a magnet attached to it in front of the bladder; and also that he said, in calling our attention to it, that this *was to revolutionize the world*, or words to that effect; that it was for the purpose of speaking through, — carrying the sound of the voice.

"*Q.* 29. Was that instrument connected in any way with any other instrument, so far as you could see, or with the building?

"*A.* No, sir; it was not in working order at the time."

There was the reproduced thing from the description in the *Scientific American*, *with the string omitted*, and Dan said to these gentlemen, "*this is to revolutionize the world.*" That, at that time, may it please your Honor, was the talk from the great Centennial Exhibition, which had occurred some months before this interview, when the telephone first broke upon mankind; and he was now reproducing the thing and the talk out of that *Scientific American*. He did not say that he had invented it; or that he had any claim upon it; or that he had made it before; or that he wanted them to put any money into it. He merely pointed it out as he would a thing with which they might be familiar, having read the account of it in the *Scientific American*.

But, sir, there was in the *Scientific American* of an earlier date — March 4, 1876 — a publication about the Reis telephone, and a statement of its mode of operation, and an explanation why it would not talk, by Dr. Vanderweyde, — a man of some scientific attainment here in New York, — which was published three days before the Bell telephone was patented. Mr. Shapley, keeping the *Scientific American*, having a file of it, when they came back from his shop, or about that time, handed to Dan Drawbaugh a copy of it containing the account of the Reis machine, and said to him, "*This is something of the nature of the machine (he) was working at then.*"

Those are the words in which Dan himself states it on the stand. He testifies (defts, ii, 1094) that Shapley said that to him when he handed him the *Scientific American* with this Reis description in it. Mr. Shapley having seen, on the 3d of October, the tin can, gave Dan the *Scientific American* containing the account of the Reis publication, and Dan, when he told his story, produced out of his own pocket the very copy which Mr. Shapley had given him. I will read you what Dan says about it. *They* asked him about it (defts, ii, 1094): —

"*Q.* 1603. There was a machine made at Paris, France, as early as 1864, and in Germany before that time, and well known in France and Germany, that is known as the Reis telephone, from the name of its inventor: had you ever known of that machine prior to Mr. Matthews's visit to your shop early in 1878?

"*A.* I think I had. *I got a knowledge of that machine from Mr. Shapley at Mechanicsburg during the time I lived in Mechanicsburg. He gave me a copy of the* Scientific American *that had an illustration and description of it in*, AND TOLD ME THAT WAS SOMETHING OF THE NATURE OF THE MACHINE I WAS WORKING AT THEN. *I think the paper may be in my shop somewheres yet.*"

Dan took that paper, and from it learned about the circuit-breaking method of Reis, and then no doubt he tried that on his tin can which he had got out of the other number of the *Scientific*

American as Bell's invention. Of course this is my inference, — the only proof is in the coincidences.

Your Honor will observe that the publication in the *Scientific American* about Bell does not describe anything accurately. It is a miscellaneous account of Bell's invention written by some ignorant person, and the consequence was that Dan made the thing like the description, without knowing the theory of it; and then he got hold of this lecture of Dr. Vanderweyde on the Reis instrument; and what he did afterwards, *and, as we suppose, in consequence of that publication*, we have proved, as follows: —

Mr. C. A. Landis, another clock maker and jeweller, a brother of the first one, went down to Dan's shop in the spring of 1877. The first visits occurred, as you see, in October, and along there, in 1876; and this other Landis went there in the spring of 1877, and this question was asked him (complts, ii, 1070): —

" *Q.* 7. Did you at any time at Mr. Drawbaugh's shop see any instrument which he referred to as a talking machine, or machine for conveying sounds by electricity; and if so, at which visit was it?

" *A.* I did, at my first visit, which was between March 31 and April 13, 1877.

" *Q.* 8. Before you made that visit, had you heard from any one that Mr. Drawbaugh was engaged on such a machine, or had your attention been called to the fact by any one; if so, by whom?

" *A.* Mr. Shapley called my attention to the fact of Dan's having a talking machine, and said I should see it when I went there.

" *Q.* 9. Will you look at the tray of instruments now shown you — exhibits in this case — and tell me whether you see any instrument among them which resembles the instrument which you saw at Mr. Drawbaugh's shop on your first visit there, about the first of April, 1877?

" *A.* I saw this instrument **B** or one similar to it, at least, *with the exception of the electro-magnets;* this **F** I saw, or something similar to it without the top; they were both lined with plaster of paris inside; I recognize nothing else.

" *Q.* 10. Please describe a little more particularly the tin-can instrument like **B** which you saw there, and state what explanation he gave you of the construction of the parts of which it was composed, and of the way in which it operated.

" *A.* I think it was perfectly similar as this **B**, with the exception of the lining *and the magnets;* at the time I seen it, the *membrane covering the opening of the can had been eaten away by mice*, he said. The string outside and the remains of the membrane were as now.

He said the manner in which it operated was as follows: The membrane had fastened to it a piece of metal; *this strip* which is fastened to the bottom board at the end of the can, — *he said it should be platina*, — it extended upward, the end being directly in front of the metallic piece on the membrane; and, by the action of the waves of sound caused by the voice on the membrane, *the piece of metal and the platina point would come in contact, thereby making and breaking the circuit, which making and breaking would be repeated at the other end of the line.* The other instrument he did not explain.

" *Q.* 11. Of what material is the strip to which you have referred, and how is it lettered in the drawing of the instrument **B**, which the respondents have put in evidence?

" *A.* It is lettered 'H.' This strip is of tin, — the one here on the instrument. I couldn't say positively as to the one I saw.

" *Q.* 12. On the occasion of this visit what led to your seeing the instrument you have testified about? Did you ask for it first, or did he offer to show it to you first?

" *A.* I asked to see it, and he showed it to me.

" *Q.* 13. What part of the shop was it in when you saw it?

" *A.* On entering from the outside stairway, it was in the small room to the left, on the third floor."

That was in the spring of 1877; and Dan had made his tin can in 1876. Having seen the Reis publication, he had tried that experiment undoubtedly; and I am now going to take out this screw which holds down the electro-magnet and show you the Reis circuit breaker in connection with the tin can **B**. Here is this narrow tin strip that leans up against the diaphragm, where there was a patch of metal on it to make the circuit; and your Honor will observe *a little hole at the tail end of this* strip of tin, to which a wire must have been connected; and here is a little screw, which passes through a slot in the tail of this tin circuit-breaker, by which it is adjusted, so that its point will alternately touch and clear the vibrating diaphragm, — just like that little Reis machine exhibited to your Honor in this case. Here is exactly the same thin metal point standing up against the membrane of Dan's tin can, just as in the Reis machine.

The COURT. — There is no spring.

Mr. DICKERSON. — No, there is no spring, of course: it don't need a spring. This point is to be set rigidly, so that the diaphragm, in vibrating to and fro, will alternately touch it and recede from it. There is no spring in a circuit-breaker, unless in one direction, so as to let the point yield after contact; but it must not follow up the contact point on the diaphragm or it would not break the circuit. In the Reis instrument, described in the *Scientific American* article, there is no spring. It reads, "a platinum point attached to the arm, while a set screw brings this point in slight contact with the disk" (defts' exhibits, p. 100). What Dan said was, that this point should be *platinum*. Platinum is the material always used for a circuit-breaker. A spark passes every time the circuit is broken, and platinum is the most refractory metal, and is able to endure the heat of the spark, and is, therefore, used as the point in all circuit-breaking instruments of any consequence. Dan told him it should be of platinum, as it should be for a practical machine; and, in proof of what Landis said, there is the thing that he describes in his testimony. That is a Reis circuit-breaker. (See for this particularly, app. p. 423.)

Now, sir, those witnesses are our witnesses; but they are corroborated by Dan in so far that Dan tells us that Mr. Shapley told him about Reis, and said it was like what he was doing Oct. 3, 1876; *to which Dan made no reply, but by his silence consented.* After Dan got this *Scientific American*, the next man who went down there saw the circuit-breaker. That was more than six months afterwards, and, the witness says, "At the time I seen it the membrane covering the opening of the can had been eaten away by mice." Dan had got through experimenting with the *Scientific American* things in those six months, and was getting ready to follow up Bell closer with his **C** and **I**, etc., for Bell's improved instruments had been described in the papers by that time.

Now, sir, these witnesses have not been contradicted by Dan Drawbaugh. His partners have not called him to contradict them; of course they could not; but, in their place, Dan's partner comes into this Court and exclaims *in this presence*, "WHAT CHEEK, TO ASK US TO CALL DRAWBAUGH!" What an answer! What an answer!

What Shapley and Landis have testified to, stand as *facts proved* in this case. The law of evidence is that that which is in the power of one man to prove, and the other to contradict, is the proper basis of testimony. When they call some idle loafer to say, "I was, on a certain Sunday, ten years ago, in Dan's shop, and I saw a certain thing there," it is not in our power to meet it. We have no witness there, and are powerless. It has only one side to it. But here we have Dan Drawbaugh as a witness; and our witnesses swear, "We said this to him, and he said this to us." It is in Dan's power to meet it and contradict it, if he dare; instead of which, his partner meets us with the logical and elegant remark, "What cheek it is to ask us to put Drawbaugh on the stand!" And this, sir, when we prove that he had those things at that time and in that way,—*which is perfectly fatal to his case unexplained and uncontradicted.*

Now, may it please your Honor, that carries us up to the spring of 1877. Let me compare that picture with what has been sworn to before your Honor. In August, 1876, his partner says Dan had reached high-water mark,—the Blake transmitter **H**, including the microphones which have since been invented by hundreds of men, and beyond which the wit of man has never since gone,—standing in that shop, on that table, by that clock, where Mr. Shapley went to negotiate with him for the use of his money, and where he showed to Mr. Shapley, and to the two brothers Landis successively, the tin can **B**, *first* with the electro-magnet on it, according to the first *Scientific American*, and next with the circuit-breaking point, according to the next publication afterwards shown him.

Well, sir, that old tin can **B** was in the case, and that tin circuit-breaker was on it, and they had to account for that; because that was a circuit-breaker right before your face,—a plain circuit-breaker, with a hole in its tail for the wire to conduct the electricity, and with a point leaning up against the place where the diaphragm would be with its centre of metal; and they had to account for that, and they asked Dan Drawbaugh what that tin strip was for. "Why, sir," said he, "that is a spring I put in there to increase the tension of the membrane." Well, that needs no comment,—that needs no comment; a man, who is a good mechanic, putting a little strip of soft tin on an instrument *to increase the tension of a drumhead.* Of course that is not true; but he had to explain that piece of tin, and it was the only thing to say, unless he gave up his case.

But we have got the witness, may it please your Honor, to whom he *did explain it,*—we have got him; he stands unquestioned and uncontradicted; and he is met by that silly pretence that a piece of soft tin, with a hole in the tail of it to carry off the conducting wire, was meant for a SPRING to increase the tension of the stretched membrane diaphragm on that tin can.

You must decide between those two stories, may it please your Honor; I do not propose to argue it. That is the way it stands, — just so, not otherwise.

While our witness has no interest in the question, Dan's interest is so immense in the golden future that he refuses to disclose it. It is so terrifically great that it runs up among the millions.

Now, may it please your Honor, the next assertion in the testimony before you, — and it is triumphantly claimed by his partner, — is that high-water mark was reached by Dan, August, 1876. Nothing more was done, — I mean *no other invention was made* afterwards, so they say, and Mr. Hill's pride was displayed when he exhibited his partner as having achieved that marvellous work. What was done afterwards? Why, sir, the testimony in the case is, that, from 1876 up to 1879 and 1880, Dan Drawbaugh *was at work night and day* making telephones (see it collected, brief, p. 331 *et seq.*). Dellinger, who did not go there until 1876, is emphatic about it. He was at work night and day making and experimenting on telephones. Dan Drawbaugh's wife, in 1876, complained of his working on telephones, — "*never before*," says Henry Drawbaugh, his brother (defts, i, 419, ans. 46). The newspapers in 1878 said that he then was busy inventing "a telephone *on a different plan from that now occupying the attention of scientists,* which will produce the sounds louder and plainer than the MOTHER INVENTION" (*Mechanicsburg Journal*, April 6, 1878; brief, pp. 210, 218). Chellis could not get Dan to work on the molasses-spigot patterns in 1878, because his whole soul was wrapped up in experimenting and working on telephones (defts, i, 549). *But high-water mark had been reached two years before;* and there stood the Blake transmitter as the monument of that labor in that shop, according to the present testimony. What was he doing afterwards? There is a little piece of evidence here that characterizes both the men. The actors are: Dan, a half-childish sort of creature, as most of these fanatical people are; Chellis, a shrewd speculator of the ninty-nine-cent variety. At that time Chellis was working Dan for all he was worth on the patterns for the new molasses spigot; but Dan was distracted by the telephone work he was doing, and neglecting his partner's work, and Chellis resorted to a little stratagem to control him (defts, i, 549) : —

"I told him," says Chellis, '"Dan, *we will hurry up* and get through with these patterns, and we will look into this telephone, and I will go in with you.' *This seemed to please him, and he talked telephone all the balance of the day, but did not do much, if any, work.*

" *Q*. Did you mean what you said, or was it only a little stratagem to get him to finish the patterns?"

"*A*. I was just using that so as to get him to finish the patterns, *and did not really have much purpose of going on with him.*"

Just as one would manage a peevish child. But what a picture is that! More than two years after "high-water mark," and the Blake transmitter standing on the table before them, and the world full of Bell and his great invention, — *if this story is true!*

All that they offer you as made in these years, however, when all this day-and-night labor are going on, are three fancy machines, having nothing new in them. One of them is the Blake transmitter *duplicated* with two contact points instead of one; and the other is a transmitter and receiver in a fancy box together. This is the machine which Dan made one of his dupes believe would cure deafness, and by which the poor fellow supposed he heard in his deaf ear. In this instrument the vibrating diaphragm, which is to affect the ear, is left in a box, and a tube leads to the ear, instead of placing the diaphragm directly at the ear, as in the Bell instruments in use. That is one of Dan's ideas, — he is the inventor of that.

Mr. HILL. — The diaphragm is in the end of the pipe that he puts to his ear; it also makes an excellent stethoscope, an admirable instrument.

Mr. DICKERSON. — The sounding diaphragm is in the box, the pipe coming to the ear; but nobody uses it or wants to use it. That is all the result they offer for those three years' day-and-night work. What was he doing in those years, may it please your Honor? Was he not hanging on to the Bell wagon, and copying the developments as they came out in the world? One of these newspaper articles says about him, "There is nothing engages the attention of the scientific world that does not also interest Drawbaugh"; and so it was here. He was chasing up Bell, going up to the Western Union office in the city of Harrisburg, examining and borrowing telephones, and tak ing one instrument home with him and keeping it two weeks; and having the instruments he did not borrow opened to see how they were made, and then going down home and making them.

The COURT. — When was that?

Mr. DICKERSON. — *That was in the spring of 1878.* He went up to our place in Harrisburg, — when I say "our place," I mean the Western Union place, — he went up there and borrowed — actually borrowed — a Bell telephone. It was in the spring of 1878, sir, when he went up there to see what is called the "snuff box."

Here, sir, is the telephone called the "snuff box," made by the Western Union Company at that time, infringing the Bell patent, and here is Dan's A.

Now the difference is, that A is round, and is turned on a lathe, while the snuff box is made in the shape of an ellipse; but they are both magneto receivers.

Dan went up to Harrisburg and asked to see the inside of this "snuff-box" instrument. Zeigler, the witness, opened it for him, who thus testifies (defts, ii, 1028): —

> "He looked at it a moment or so, and with a significant shake of his head said, as near as I can recollect, 'Mine will not do: it is too much like that.'"

I should say so; I should say it was slightly. Then he borrowed the Crown instrument, which is a magneto instrument made by Phelps, owned by the Western Union It has the permanent magnets curled around behind the electro-magnet, instead of extending out behind it in a straight line, as Bell makes them, but they are the same in effect. It is a fanciful way of making the instrument. Did Dan get his idea of the curled and bent magnets then? DAN NEVER THEN SAID THAT HE HAD INVENTED THE TELEPHONE!*

This all happened when Dan was working day and night on telephones, and when his wife at home was naturally complaining that in place of attending to his business, — the business at the faucet place, or the clock place, or wherever he had anything else to do, — he was bothering himself with these things, and not doing any work; and she said to Chellis: —

---

* See Zeigler, abstract, 412; Wert, p. 415. Also, brief, 221, 279.

"Mr. Chellis, Dan works at the telephone as soon as you go away, and most every night does not get home until twelve or one o'clock . . . and he said he would go to the poorhouse before he would give up working on it" (defts, i, 549).

How much we are indebted to Chellis for valuable information! That was in 1878–9. Where is the product of that work? It does not exist, *unless it is to be found in the instruments which are said to have culminated in August*, 1876.

Now, sir, that is the story told by both sides. It is our story uncontradicted; but all this, your Honor, is in our brief and our abstract, and I will not now read the testimony relating to it. I am trying to bring your Honor up to our points by making a rapid statement of the testimony in its logical order.

The COURT. — Have you anything in your brief bearing upon that point?

Mr. STORROW. — It will befound pp. 189, 190, 203, 204, of the brief.

Mr. DICKERSON. — We now come, may it please your Honor, to *the record evidence;* and here we have got Dan Drawbaugh on record.

Mr. Matthews from Baltimore, the editor of the *Baltimore American*, attracted by the publication in his own paper of an article in which Dan Drawbaugh was described as the wonderful inventor of this wonderful clock, travelled two hundred miles to see the wonderful clock, when every newspaper was full of telephones. That was in the spring of 1878. Drawbaugh, at that time, your Honor, had in that room where he and Mr. Matthews stood, *if this testimony be true*, this collection of the most marvellous creations that ever came out of the brain of man, as their expert tells your Honor; and *Drawbaugh did not show them, or say a word about them.* Think of it! it is a miracle. Not the kind of miracle by which Dan made the deaf man hear; here was a man too intelligent to be humbugged. Mr. Matthews and Dan stood together in that room, April, 1878, with all these marvellous things, when every newspaper was full of the telephone, and the improvements on it which were being made by hundreds of experimenters, and what did he say? Mr. Matthews wrote an account of what he said and published it. Here it is; it is a mere incident to his elaborate account of Dan's wonderful clock: —

"It may be *mentioned* that Mr. Drawbaugh constructed a rude telephone long before Edison loomed up as the boss inventor. HE NEVER EXPECTED TO SEND ARTICULATE SPEECH OVER A MAGNETIZED WIRE; but he believed that the ALPHABET could be arranged after the manner of the musical scale, and that messages could be transmitted by the variations of tone and pitch."

Your Honor remembers Dan's ALPHABET instrument, which so many have described.

Matthews *took notes of Dan's statements*, and went home, and wrote his account to the best of his recollection; and he sent that paper back to Dan, who acknowledges its receipt. Dan then stood in the presence of a man who could have given to the world on the wings of the wind the claim that he was the first inventor, or could have given vent to his moans, if he had any. Bell stood before the world crowned with glory. But here with this ready vehicle for appearing before the ungrateful world, and telling his wrongs or his rights, what did he say? Why, that he experimented on this thing before Bell or Edison, but DID NOT EXPECT TO GET ARTICULATE SPEECH. Mr. Matthews, who was not a scientific man, drew a conclusion from what he said that he had intended to use musical tones. He says in his testimony that Dan did not *speak* of musical tones, but he inferred from his talk that he meant to use them.

Imagine, sir, Dan stating to a newspaper editor in 1878 that he had "NEVER EXPECTED TO SEND ARTICULATE SPEECH," if he had in that room, and had had for ten years, instruments that would talk so that a countryman, or a child, or a woman, could come in there and read newspapers through them, well known to everybody in the neighborhood; and when there they were, monuments of his work, standing all around him, about which he never opened his lips, except to say he never expected articulate speech.

It is not in human nature! God does not make the human animal that way. None was ever made so. He makes them so that they will lie, and will steal, and will do all manner of evil things; but he does not make any that will act like that. He never has; and the Court takes judicial notice that he never has. (For Matthews, see brief, p. 210.)

Mr. HILL. — Just a moment. I will state that the letter of

Matthews has not been filed; I am so informed by the clerk, who tells me that it has not been filed.

Mr. STORROW. — It is to be filed, and it has been in the clerk's hands this forenoon.

Mr. DICKERSON. — That is to be the part of the proof. Now, may it please your Honor, *this was a mighty piece of evidence.* It needed very much that it should be attacked; and it *was* attacked in the most delicate and insidious manner that I have ever seen in a court of justice. My friend, Senator Edmunds, with the tact which characterizes him in all his efforts in the world, either as an orator, a logician, or a gentleman, being entitled to take every *fair* advantage in the case, thought that he would give Mr. Matthews's deposition and Mr. Bell's counsel a stab in the back. In the most delicate manner he turned to my Brother Storrow, right here, and said, "I think it my duty to ask my friend, Mr. Storrow, if he has not a letter from this witness contradicting or impairing his testimony." That was a delicious moment for us. We saw Mr. Edmunds looking into the muzzle of that gun to see whether it was loaded — and it was. He was not here this morning at the funeral. He shot a Parthian arrow and fled. Here is the letter which was to demolish Mr. Matthews and us at once, and it only reaffirms Mr. Matthews's deposition. If Brother Edmunds had known us as well as we know him, he would not have suspected us of suppressing any testimony.

But, sir, another *record* came up just then, — DAN DRAWBAUGH'S AUTOBIOGRAPHY, written by his own procurement, and published in the place of his nativity, in which he says of himself — what? That he is the "*inventor of the* JUSTLY CELEBRATED ELECTRIC CLOCK, *and of several kinds of telephones.*" Well, there was one thing at that time in the world JUSTLY CELEBRATED, and that was the telephone; and there was the electrical clock, which Dan had got celebrated, but not "*justly.*" There is where he put in a falsehood that he invented the clock; but it was *celebrated.* But, being the *true inventor of the telephone, as he now says*, and having copied Bain's clock out of the encyclopædia, he stood there and gave to the world an account of himself in the spring of 1878, and he told the world, "I am the inventor of the *justly celebrated electric clock*, and of *several kinds* of telephones."

And your Honor now knows, because you have been told so by Dan's partner, that *we* were trying to hunt up Dan's manuscript of that published autobiography TO DESTROY IT, FOR *fear your Honor should get at it*, in which we failed ignominiously, because Dan's partner produced it *out of Dan's possession*, to make sure he wrote it. The opening sentence of that autobiography is,

> "DANIEL DRAWBAUGH.
>
> "*One of the greatest inventive geniuses of this age* (SO PROLIFIC OF GREAT MEN) *is the subject of this sketch, Dan'l Drawbaugh*, who was born in year ——, in the quiet, secluded village of Milltown, three miles S. W. of Harrisburg, where he has spent the greater portion of an active life conceiving and producing, as a result of an unusually fertile brain, a score of useful, ingenious machines and devices."

We *know* that Dan is a very "modest and diffident" man, because an unimpeached witness has so sworn. How it must have tried him to write this!

At Mechanicsburg, at this time, his friends were publishers of two newspapers, called the *Saturday Evening Journal* and the *Independent Journal;* and in April, 1878, they were puffing Dan and reporting what he said to them of himself. These papers had, in * October, 1877, spoken of "Bell's telephones" going into use in England; and April 6, 1878, the *Journal* states, "we have been informed that Dan Drawbaugh, the celebrated mechanic of Eberly's Mills, is inventing a *telephone on a different plan from that now occupying the attention of scientists, which will produce sounds louder and plainer* THAN THE MOTHER INVENTION."

The COURT.—Where is that reference?

Mr. DICKERSON.—I will give it to you, sir: p. 398, complts, iv, exhibits; brief, pp. 209–218. On the next page the *Journal* describes Drawbaugh as a magnificent genius,—how he talks like a buzz saw. They say, "He labors like he talks, with a *rush and a gush, that nearly bewilders his auditors.*" You could no more understand him than you could understand a buzz saw. They then say, "*We are under obligations to him for much information in general and* TELEPHONES IN PARTICULAR, and the *Independent Journal* will be glad to announce the completion of the NEW TELEPHONE *he is constructing*, and hopes the speaking machine will bring many dollars into the pockets of its ingenious inventor."

---

* Complts, iv, exhibits, 407.

The editor also says: "Mr. Drawbaugh is an indefatigable worker in his *special* line, and he never gets discouraged." We have found *that* out to our cost, sir.

The COURT. — Will you give me a memorandum of that?

Mr. DICKERSON. — Yes, sir; that is p. 398 of Vol. IV. of complainants' exhibits, brief, pp. 209, 218. There is Dan Drawbaugh on record on his own information.

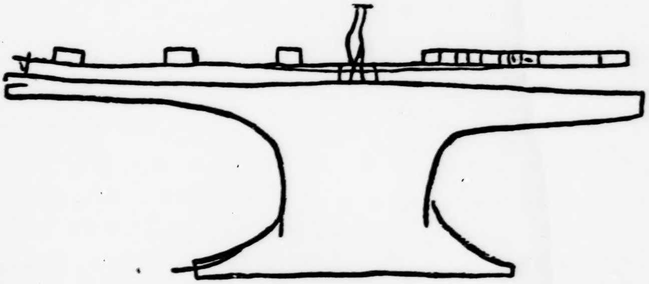
The COURT. — Who was the correspondent who contributed this article to the *Saturday Evening Journal* of Mechanicsburg?

Mr. DICKERSON.—It was done by the editor.

Mr. HILL. — A man by the name of Rockafellow, whose affidavit they took in their moving papers, but did not examine as a witness, because he had been convicted and sent to the penitentiary.

Mr. DICKERSON. — It is true, I believe, that the man has since been in the penitentiary; but the articles were published in a newspaper, and the newspaper has not been in the penitentiary, that ever we heard of. They were published at the time in his own village where he lived, and by his friends: and Dan Drawbaugh has not attempted to explain or contradict them. We could not call this convict, of course, so we tracked Dan right to his office, with his telephones in his hands, and we cross-examined Dan about these articles, who admitted that Rockafellow came to see him and was shown the telephones Dan was then working on (brief, p. 209).

I now proceed a little further. About that time, sir, his Clock Company was at work, and he was going through the farce of applying for some sort of a patent about that clock, and the company employed Mr. Theophilus Weaver as their patent agent, and Drawbaugh went to Mr. Weaver to give him instructions how to draw the patent for his "*justly celebrated electric clock*"; and then he said to Mr. Weaver, "I experimented on the telephone, though I never made anything out of it." Mr. Weaver was a patent agent, and naturally anxious to follow up a suggestion like that, and in reply to a question, Dan said to him that he had been experimenting on telephones; and Drawbaugh drew a sketch of the telephone he had been experimenting with on the back of the specification which Mr. Weaver was preparing for this "justly celebrated electric clock." And that is how it came to be preserved. Theophilus Weaver produced it; and here is a photo-lithographic copy of it (complts, i, 399; iv, 363.)



This was in the spring of 1878. Just look at that sketch, your Honor. You see that there is evidently a lever running from left to right over a telephone diaphragm, with its point resting on the centre of the diaphragm, and with a wing or flat piece out at the extreme right-hand end. You see that the motion of the telephone diaphragm communicated at its centre to the lever by the pin will be increased at the end of the lever; and the amplitude of vibration will be increased. If the centre pin moves the one eighth of an inch, for illustration, the end with the plate on it will move two eighths, and more sound will be made. This is an idea that has been hit upon by many mechanics, — that possibly they can make the telephone talk louder by putting on a lever and increasing the amplitude of the air vibrations which strike the ear. It is an obvious idea to a mere mechanic, but it is not a practical thing to the electrician.

Well, he made this drawing on the back of the specification that Weaver was then writing for his clock. That is the way, in the providence of God, that it comes to be preserved; and we have it here, and it shows how Dan was going to make the telephone "talk louder." Mr. Weaver was an old friend of Dan's; he had been his friend for years and years; he had been the man to whom Dan had been applying from time to time for patent information; and Dan had been reading patent books in his library. More than that: in 1876, when the Axle Company was about winding up, Mr. Weaver had a mind to buy it out, and he went down there and spent two days with Dan, in that very room where **D** and **E** and **L** and **M** and **G** and O, and all these things were, in taking an inventory of the Axle Company's property, for the purpose of determining whether or not he would buy it. During all that time Dan never said "telephone" to him. Weaver was *his friend and a patent agent*. As they now swear, Dan was all the while bursting with grief, and bemoaning his hard fate, because he could not get anybody to apply for a patent for him for these great inventions, which, at that time, he had brought to their ultimate perfection. Does anybody believe that? The intellectual stomach can hold that stuff about as easily as the physical stomach can hold two ounces of ipecac. The defendants made an insulting cross-examination of Weaver by putting into their questions insinuations, every one of which was false; but they never attempt to contradict him by *Dan, who knows* that it is all true. (See abstract, p. 398.)

But we will go a little further. There are two gentlemen in Harrisburg, by the names of Kiefer and Wilson. At that time, Mr. Kiefer was the superintendent of the telegraphs of the Pennsylvania Railroad, and also had a telegraph-supply store in the city of Harrisburg, where he sold electrical supplies. His firm manufactures for the United States government their electrical apparatus. The other gentleman is Mr. Wilson, the telegraph superintendent of the Northern Pennsylvania Railroad, which runs up through Harrisburg, and diverges through different parts of the State. Now, if there is any human being on the face of the earth who is and must be accurate and reliable, it is the superintendent of the telegraph system of a great railroad. Thousands of lives depend upon the accuracy with which he administers his responsible trust. A single message falsely sent or falsely omitted, and a train rushes to destruction, and hundreds of lives may be lost. Plunging, as trains do in the dark night, through fog, and sleet, and snow, they must rely with the most perfect confidence upon the fact that that little wire has carried before them the information that they are coming, that the line may be clear. If the operator neglects his duty, then a terrible crash may occur. And here is almost the only danger of railroad travelling to-day. Since I have been arguing this case, we have read in the papers an account of a terrible calamity which has occurred upon the Baltimore and Ohio road because one of the telegraph men failed to do his duty, and thereby sent to sudden death innocent men who had relied upon and trusted the ability and fidelity of that man. Their fate had depended upon his integrity. These two gentlemen, Kiefer and Wilson, were the superintendents of the telegraph lines of those two great systems. One of them is now, or was when this testimony was taken, the mayor of the city of Harrisburg, although I do not know that that of itself is any great recommendation; but to be the superintendent of one of these great systems for years *is a very high recommendation.* These men were friends of Dan Drawbaugh. He went to them for information, and for supplies, and he took to them his magneto key, and wanted them to use it. Yet, during all those days he never said "telephone" to either of them. If he had, *and if he had had those things*, Alexander Graham Bell might as well have not been born. His name would never have gone beyond the town of Cambridge, or wherever it was that he then lived, if this testimony be true.

In their argument my adversaries have never attempted to explain to your Honor why he did not speak to Kiefer or to Wilson (for they were both helping him with his electrical work), — why he never said to either of them anything about his telephone. They do not attempt to explain this fact. They are as dumb as an oyster; but they turn to your Honor and say that they have a cartload of Ditlows and Kahneys, and cattle like that, and that you must believe their story, because they have sworn to it. For Messrs. Kiefer and Wilson see brief, pp. 273–8.

The Court. Have you any evidence as to what instruments were in his shop — either these, or resembling these — prior to the time when he was at work on the magneto-electrical machine?

Mr. Dickerson. Yes; we have some evidence on that subject. Undoubtedly the string telephone was there. Two or three of their witnesses described *the tin can with a string*. In John Drawbaugh's shop, across the road, there was a string telephone; and about that there was a piece of work done that I will occupy a minute or two in speaking of, for it will illustrate the whole case. It and other evidence on the subject are in our brief (pp. 311–313).

John Drawbaugh, Dan's brother and next-door neighbor, had a string telephone in his place, and the partners knew about it. A witness named Eppler speaks of it. He told the partners about it. He told them that he had seen in *John* Drawbaugh's place a talking machine, which was a *string telephone*, and that he had gone home and made one. Thereupon they called him, — or rather we had called him as our witness about a date, and they made him their witness on that subject, — and proved by him, by careful and adroitly limited questions, that he had been at Eberly's Mills in a shop owned by a *man named Drawbaugh*, and had seen a talking machine there in the year 1872, 1873 or 1874, — somewhere along there; and that he had told Mr. Storrow that he had seen a *talking machine* in Drawbaugh's shop at that early day. That looked very serious. If they could have proved that Mr. Storrow had information of such a thing as an electric telephone at that time and place, and had suppressed it when he put the witness on the stand about something else, they would have damaged us and our case immensely. They took the chances of trying to do that very thing by that particular witness. When the direct examination closed it left us in the position of having been told that *Drawbaugh, impliedly Dan, of course*, had a telephone, a talking machine, in 1872, 1873 or 1874, and of never having mentioned it. If that fraud won, it was all right; if it failed, they thought they were no worse off than they were before. Fortunately for us, Mr. Storrow knew all about it; and on cross-examination it turned out that this witness had told him that it was a *string telephone* in John Drawbaugh's shop there in the village, and that he had gone home and made one himself just like it; and, more than all, that he *had told the true story to Mr. Hill before he was examined.*

The COURT. — Did he say it was in Drawbaugh's shop?

Mr. DICKERSON. -- Yes; in "*Drawbaugh's*" shop.

Mr. HILL. — But not in Daniel Drawbaugh's shop. Daniel never had anything to do with it.

Mr. DICKERSON. — The witness was so examined as to say it was in "Drawbaugh's" shop, which your Honor, or any one under the circumstances, would have understood to mean Dan Drawbaugh's. *We* got it out of him that it was in *John* Drawbaugh's shop, and a string telephone; but he said "Drawbaugh," and left the inference that it was Daniel Drawbaugh's shop, and that it was the *electric telephone*. That was a stab in the back that might have made a wound that could not have been cured; but fortunately for us, Mr. Storrow knew the facts, and proved by him that he had told them all to Drawbaugh's partner before he was examined. It left a string telephone right there in the village in the hands of Drawbaugh's brother on that day, and neither Daniel nor John Drawbaugh have been called since.

Mr. Storrow walked among pitfalls and was not entrapped; he handled pitch and was not defiled.

We do not attempt to reconcile the defendants' contradictions, or to explain their story. Many witnesses have sworn to things who are not specifically attacked. A laborer swears that ten years ago he saw a telephone, and tells nothing else important. How can he be assailed? He does not describe anything, and is incapable of doing so; but they hold up to him the tin can and he says he saw it and heard it talk. Maybe he did in 1877. Maybe it was a string telephone he saw in 1870. We don't know. But there are a great number of cases where these witnesses have been carried over from the date before our patent as sworn to by them to the true dates when they saw Dan working these things, and so have proved our case for us. As your Honor knows, these witnesses were examined *years after the event*. Whatever Dan did, no doubt happened between 1876 and 1880. *Our* witnesses saw it then from its beginning. Their witnesses saw it too, and then shoved it back years, either wilfully or ignorantly. I will give you one illustration on this point, and will then have done with it.

The COURT. — I did not know, when you spoke of the existence of a string telephone, but there were some intelligent witnesses who had testified expressly to having seen it.

Mr. DICKERSON. — There are specifically Eppler and Eicholtz (brief, pp. 311–313). Generally they simply state the facts that can be accounted for only by the existence of the string telephone. One witness says that the instrument was composed *of two tin cans with a wire betweem them* (brief, p. 310). That was a string telephone. He does not call it a string telephone, but he describes it.

The COURT. — When did these string telephones first come into use?

Mr. DICKERSON. — They are [illegible] record prior to 1869 (complts, ii, 1175).

Mr. HILL. — They have been known since 1680, in some form or other. They are very old. They are sold on the street, and then disappear for a while. Now they have got them improved so as to be very useful. A number of ingenious appliances have been made, and they are capable of being used to some advantage.

to prove by a hundred laborers that they saw some incredible thing ten years ago, and they should swear to it, and it is perfectly absurd in its face, what then? The other side would say, "Well, that is proof; why don't you impeach their character for truth and veracity in the community in which they live?" We say that they have no character for truth and veracity, or anything else. They are mere ciphers in the body politic. Their story must be judged by other standards.

I now come to a few remarks about the Bell patent. It has been criticised at length. I do not think I need to spend any time about it. Whatever is to be said about it is in our brief, and, I take it, the questions are concluded by the decisions of the courts, who have heard this kind of talk before, and have passed upon it; but it is just to Mr. Bell that I should make one or two statements with regard to his patent. In that patent you will find two things. One of them is a general description of a liquid transmitter, — one mode of producing the undulating current, which is the basis of his invention, by varying the resistance through a liquid transmitter: that is in the patent, I read from page 5 of the Book of Patents: —

> "Undulations are caused in a continuous voltaic current by the vibration or motion of bodies capable of inductive action; or by the vibration of the conducting wire itself in the neighborhood of such bodies. Electrical undulations may also be caused by alternately increasing and diminishing the resistance of the circuit, or by alternately increasing and diminishing the power of the battery. The internal resistance of a battery is diminished by bringing the voltaic elements nearer together, and increased by placing them farther apart. The reciprocal vibration of the elements of a battery, therefore, occasions an undulatory action in the voltaic current. The external resistance may also be varied. For instance, let mercury or some other liquid form part of a voltaic circuit; then the more deeply the conducting wire is immersed in the mercury or other liquid, the less resistance does the liquid offer to the passage of the current."

There is the variable-resistance method, done through a liquid.

> "Hence the vibration of the conducting wire in mercury or other liquid included in the circuit occasions undulations in the current."

Then he goes on and mentions other things; and then he describes the *generation* of a variable current, made variable in the act of its creation. That is the magneto method, with which your Honor is familiar; and he then describes Fig. 7, *the speaking telephone.* The fourth claim of his patent is: —

> "4. The method of producing undulations in a continuous voltaic circuit by gradually increasing and diminishing the resistance of the circuit, or by gradually increasing and diminishing the power of the battery as set forth."

The fifth covers the whole field: —

> "5. The METHOD OF and apparatus for transmitting *vocal* or other sounds telegraphically, as herein described, by causing electrical undulations, *similar in form to the vibrations of the air accompanying the said vocal or other sounds*, substantially as set forth."

That was the great discovery — to bring that current of electricity under the *control of the voice*, so that its "form" (to use a scientific term) should vary exactly as the "form" of the air waves generated by the *voice* of the speaker varies. That was the magnificent conception which has filled the world with speaking telephones, and made this dull earth as if it were a living body, alive with nerves from one extremity to the other. That, sir, was the grand conception; and *that was patented as a speaking telephone* (brief, p. 68).

When it came before the men of science in the world — before those chosen judges who assembled to Philadelphia, the chief of whom was Prof. Joseph Henry, tutor of my boyhood, guide of my youth, friend and companion of my manhood! and along with him Sir Joseph Thomson, the greatest living electrician — they bowed their heads in veneration; they expressed their astonishment in words beyond which the English language cannot go. Sir William Thomson said: —

> "Who can but admire the *hardihood of invention* which devised such very slight means to *realize the mathematical conception*, that if electricity is to convey all the delicacies of quality WHICH DISTINGUISH ARTICULATE SPEECH, the strength of its current must vary continuously, and as nearly as may be, in simple proportion to the velocity of a particle of air engaged in constituting the sound." (Brief, p. 66.)

Before that great tribunal Alexander Graham Bell appeared, unheralded and unknown; and, as if illumed by a flash of lightning, he emerged from that great exhibition with *a name*, — the only name which was there made immortal.

But who else was there?

Groping around in that crowd was Daniel Drawbaugh. He spent five days there. When Mr. Bell stood upon that pedestal of fame, honored by the assembled wisdom of the world, Drawbaugh had at home, as they now swear, and **E** and **H**, the Blake transmitter, and he opened not his mouth. He went there with the richest man of his village, — George Leonard, — who was his next-door neighbor for years, and who had never heard at home of Dan's invention. But Dan was so modest that he could not even lean over and whisper in Leonard's ear, "My dear sir, this is very remarkable; I have had those things at home for ten years, but never told you before. Don't mention it to anybody now, for fear that my modesty may be shocked; but I have got them *much better* at home." He did not even have the courage to do that. He stood there in blank silence while the pæans were sung in praise of Bell's wonderful invention. Then what did he do? He went right home from that place, and never opened his mouth to anybody to complain, but sat down to work out a deliberate little scheme to cheat Shapley out of some of his $2,000, by selling him the *right to patent the electric clock;* and he made the contract to do it on the 6th of November. That is what happened. And from that time he plotted on with his little games, beholding this magnificent invention extending all over the world, yet never opened his mouth. When his partners, the ninety-nine-cent man and Dr. Moffitt, made their contract with him in 1878, two years afterwards, to go into the molasses-spigot business, he asked them to help him in his telephone experiments, but they objected that Bell was the *inventor* and he couldn't anticipate Bell; to which he said, "I don't know about that; I have been working at it a good while," — when, right there in that room, where they all then were, were all these great inventions, perfected, then two years old, and the telephone itself more than eleven years old. I cannot talk about such stuff with patience. As the Supreme Court said in the Atlantic Works case, it may be all true, but it would not be safe for courts to assume it to be true; it is so contrary to all the rules that govern human conduct.

Now let me show you, if I need to do it, Dan's "Blake transmitter," and with it the *real one*. It has been pointed out to you earlier in the argument, when you were not so familiar with the physics of the case as now. They are the same thing. There is not the least difference. When Macaulay was reviewing the Life of Madame D'Arblay, — born Frances Burney, — and came across some passages in Evelina in the magnificent diction of Dr. Johnson, who was the intimate friend of the author when she wrote the book, he pointed them out in his review, and exclaimed, — "Sam Johnson, or — the devil." That is all I need to say here: "Blake, or the devil."

Here is the Blake transmitter. It has a cast-iron ring just like Dan's. Here is our cast-iron ring. Our bridge is across here just the same; then the delicate adjustment; and then comes the carbon holder. The joke of it is that in the real thing that little brass cup which holds the hard carbon is filled with lead *in order to give it inertia*, which is essential; but one cannot *see the lead* without first taking out the carbon. When Dan copied it he made the brass cup just as in the original, but he *did not put in the lead*, which he couldn't see. That was his *modesty* again. But another thing. There is a spring finger which holds our diaphragm in place. It is very desirable to have the diaphragm untrammelled at its edges; and this finger holds the diaphragm in its place in such a way that it does not need any other fastening and can be left untrammelled. But, as you look into it, you do not see that the diaphragm is untrammelled at the edge, and Dan did n't know that device. He hadn't borrowed a "Blake transmitter," and taken it home to dissect, as he did the magneto instruments. Well, sir, Dan has put the finger there to hold the diaphragm in place; *but he has also screwed the diaphragm fast*, whereby the capacity for free vibration is impaired. He fell into that trap as he did into the brass cup, because he could not see on inspection these two things.

When he was working days and nights, and running up to Harrisburg to see those instruments, he did not know all about them; and so, when he copied them, he did not copy those concealed devices.

And there, sir, is that electrical lever — the Ruhmkorff coil — right in Dan's box, as it is in the Blake transmitter. What did he know about an electrical lever, and the Ruhmkorff coil? How should he even know that it was needed? He did not have any light on the question. The *necessity* for that thing was ascertained only by trying the telephone *over long lines*, where the current was affected by the induction which comes with long lines, and where this device was needed to increase the intensity, which it does. But until a man had tried the experiment on a long line —until he has made that thing and found it to be deficient — he would not think of applying a Ruhmkorff coil there.

And so in regard to this wonderful microphone. Let us see how that was discovered. The moment Bell's patent came into existence, in which he pointed out to the world the variable-resistance method, — he had two telephones in Philadelphia in June, 1876; one with a battery and variable resistance, and one the magneto instrument, — the moment they came out hundreds of men immediately began investigating to find out some better material for the variable resistance than water or mercury as pointed out in Bell's patent. Edison, with that kaleidoscopic brain of his, that keeps turning out infinite permutations, set his whole shop to experiment on that problem, — picking up a lump of coal, or a piece of pine wood, or anything on the earth, and trying it in order to see what was the most sensitive. There was only one way by which they could find that out; and that was by the use of the telephone itself. There is no other instrument known to man which can detect these delicate variations. Nothing can do it but the thing itself. *It* had to feel for and find out carbon. That is how the *scientific men* found it out, — by months of experiment. There is nothing else will do it. But Dan had only to walk up to Harrisburg and pick up a piece of hard carbon in the yard of the gas company and put it in. That is how he found it, he tells us. Talk about hundreds of men being engaged in making that discovery; he could beat them to death on that. He simply walked into a gas house and picked it up, and it was all right. Nothing easier in the world. But his partner asked him how he came by it. It was of course to be supposed that the man must have had some road to it, and so he was asked that question (defts, ii, 805): —

"*Q*. 150. Do you remember *how* you first obtained knowledge of that fact that low conductors, when under pressure, would conduct the current more freely than when not under pressure; that is to say, did you learn it by reasoning it out and then testing it, or by accidental discovery, or by reading it somewhere, or by hearing it from some one, or how?"

That is the question. How did you get at it? Why on earth should a man think of doing such a thing? What led him to it?

"*A.* I don't remember how I came to it; I had been experimenting in that direction; I DON'T REMEMBER OF GETTING AT IT BY ACCIDENT EITHER; DON'T REMEMBER OF READING IT; I DON'T REMEMBER OF ANY ONE TELLING ME OF IT; I DON'T SUPPOSE ANY ONE TOLD ME."

There is the discovery of a fact that has given fame and fortune to a number of people in the world; yet when Dan was asked, "How did you find it out?" he says, "I don't remember; I don't know; I don't know whether I read of it; I don't remember of any one telling me of it; I cannot tell how I got it." (See brief, p. 286.)

Mr. HILL. — The Blake transmitter came out about the beginning of 1879.

Mr. DICKERSON. — No, sir; it came out before the beginning of 1879; it came out in the fall of 1878. Now, don't make any statements, because you are wrong, every time.

Mr. HILL. — The first came out in November, 1878, but it did not begin to be introduced generally until the beginning of 1879.

Mr. DICKERSON. — All these things are in the papers. I am stating my recollection on the subject, without turning to the papers. The invention that led up to it began away back in 1877. Carbon for telephones was in the newspapers in 1877. It is all in the record. (Complts, iv, exhibits, p. 433.) Edison was the leader. His experiments were in the newspapers. Dan was following him with that devotion to science which induced him to do everything that other scientific men did, *just after they did it.*

We have had an argument on these questions. We presented these points in our general presentation of the case by my learned brother Storrow, whose knowledge of this record, as compared with mine, is as the knowledge of Henry, compared to a schoolboy's. He made that record. He stood by it during all these years. It has grown into his intellectual fibre so that he can put his finger upon the very place of the page where anything is. He has given this argument a perfect explanation before your Honor; and the other side was here to answer it. They brought one of the ablest lawyers of the United States, — a man whom we all honor and admire, — and whose eloquence always commands the attention either of senates or of courts. He made an argument. He told your Honor that he had gone over this record page by page and paragraph by paragraph, and knew it by heart. He began his argument by telling us about Columbus. He said: "Behold Columbus. He offered a new world to the kings of Europe, but no man would listen to him"; and he then compared Dan Drawbaugh to Columbus, — as the man who had offered this new world to the country folks around Eberly's Mills, and nobody would listen to him. There was one little defect in the comparison, which lies in the fact that when Columbus offered the new world, *he did not have it;* but when Dan Drawbaugh offered his world, he had it (if their testimony is true) and could show it. That was a slight difference between the two cases.

But I will just reverse the order of that comparison. Suppose Columbus to have discovered America, and for four years afterwards to have enjoyed the fame and fortune which it conferred upon him; and that then some fellow who had been paddling about in the harbor of Cadiz in a dug-out for some years should have come ashore some day and said, "I discovered America years and years before Columbus." That would be a startling proposition. They would naturally ask him, "Why didn't you mention it before?" "Well, I don't know." "But you stood right here in the crowd and saw the grand procession pass by with the great admiral at its head?" "Yes; I was there; but my modesty overcame me so that I could not speak." "But what means had you for going there? That dug-out of yours is not a ship, and you had no compass; how did you get there?" "Oh, well, I don't intend to explain that. I don't know whether I read of that, or heard of it; but I got there. I know I did, or I would not say so." "But you have got upon your chart not only Cat Island, which Columbus discovered, but you have the continent, and all the other islands that were discovered by a hundred other navigators afterwards. How do you account for that?" "Oh, well, I went there frequently." "But when did you discover these other islands? In what year?" "Gentlemen, I cannot really tell; I would tell if I could, but I was discovering so many continents just then that I have really forgotten."* "But," says the interlocutor, "look here, my friend, I see on your chart, which you have got, not only all those things, but you claim to have discovered Rome, and Egypt, and Athens, and Jerusalem;† and you have got people around you who you say came from Jerusalem to prove you have been there. How does that happen?" "Well, gentlemen, I cannot tell; but here are the charts." "But Rome and Jerusalem, Egypt and Athens, were discovered before America, and yet you say that you discovered all those places; how did you happen to get them on your chart?" "I did not know they were discovered by other people. I am not a scholar. I do not read very well. But if you have any doubt about it, I can show you the people that I brought with me."

Now, that is the story that Mr. Edmunds's venerable friend Dan tells, applied to his Columbus illustration. You are asked to believe that the man in the dug-out, who had stood by for four years and seen the fleet sailing, and the Great Admiral lifted above all other men in the world, and yet opened not his mouth, had actually done all these things, simply because he tells you he can go to the dock and get two hundred and fifty fellows who will swear that he told them *he* did it, and showed them the *outside* of his map.

---

* Drawbaugh's deposition (defts, ii, 827): —

"*Q.* 268. Do you recollect when this instrument **H**" [the Blake transmitter] "was made, so as to fix the time?

"*A.* Not positively; I don't know any date particularly.

"*Q.* 269. Several witnesses have testified to seeing this machine, either completed or in process of completion, in the fall of 1876. What is your recollection as to that fact?

"*A.* The time elapsed — just judging by the time — it may be at that time or before; *I had been making a good many of them; I paid no attention to the time; it has slipped my memory.*"

As to making D and E, defts, ii, 827: —

"*A.* 265. *I have no recollection of the time. . . . I can't remember the year or date of it.*"

See brief, pp. 362-365.

† Dan claims to be the inventor in 1867 of Bain's electric clock, first shown in 1840, and published in the encyclopædias generally; Henley's alphabet telegraph, patented in 1861; the magneto key, patented by Henley and Foster, in 1848. for operating the needle telegraph, published in the ordinary telegraph manuals, which Siemens in 1859 improved by adding his new armature and applied to the Morse system; the *automatic* fire alarm, by means of an expanding rod which will close an electric circuit and ring a bell when slightly overheated, patented by Wheatstone in 1860, and with some modifications advertised and put into general use in the country for years by Watkins and others; Bakewell's and Caselli's copying telegraph, well known long prior to 1867, and in electrical books generally (for all of which see Pope, complts, ii, 1381 *et seq.*); Horton's patent pendulum, shown him by Shapley, and this applied by him to the "*justly celebrated electric clock,*" and claimed as his invention (complts, iv, 358-9); the phonograph, the Giffard injector, the rotophone, every variety of telephones and eveay improvement of detail in them, besides winding engines, and a host of other traps. For these see brief, pp. 340, 341.

The argument of Mr. Edmunds consisted of three points, and they were very good points, if his premises were true. *First*, he said that Drawbaugh did not make this invention known, because his neighbors scoffed at him, and scouted him, and nobody would believe it, therefore, he kept it to himself. That was a very good argument. There have been inventions made by men who were scoffed at by the world, and they kept quiet. It is not an unexampled fact. But such is not *this* case. Pages of witnesses (I will not stop to read them now; they are on the record and in the brief, pp. 79–84) tell you that they all said he would be the richest man in the valley if he could only do it; that they all recognized its great value. His brother Henry told the fellows up in the woods, that Dan would become the richest man there; that his invention was of immense value, and would supersede the telegraph. The fact assumed by my friend is not so.

Then my brother Edmunds fortified his argument with another statement. He said that Mr. Orton, the president of the Western Union Telegraph Company, scouted this thing, and did not recognize it until the fall of 1878; and it is printed in the brief (p. 234): —

> "Mr. William Orton, president of the Western Union Telegraph Company, had knowledge of the Bell telephone as early as April 7, 1877, as appears from the letter signed by him and others (complts, i, 270), and had his attention pointedly called to it by Mr. Pope, the 'special advisory electrical expert' of that company, and also of the Gold and Stock Telegraph Company, of which Mr. Orton was likewise president, yet he did not stir in the matter of attempting to acquire an interest under it till the summer or fall of 1878, as we learn from Mr. Pope's deposition (vol. 2, pp. 1285–1287, ans. 1, 2; p. 1428, ans. 310–314).
>
> "*Mr. Orton did not stir in the matter of attempting to acquire an interest under it till the summer or fall of 1878*"!!

That is put in italics in their brief. Now, if there were wanting any example of the fallibility of human memory, perhaps this one would be as striking as any that could be produced. Here is very able gentleman, Mr. Edmunds, employed to know the facts in this case, — paid to know them, bound to know them under his obligation to this Court, — an obligation that is as strong as if he had sworn to each statement. He has told you that he has read every word, line and paragraph; and he comes before this Court and makes those statements, no doubt, entirely sincerely, as the basis of his argument. But the fact is, that Mr. Orton, in April, 1877, signed the call for a meeting to hear Mr. Bell explain "*the commercial value*" of his instrument, in the city of New York; and at once, *in the summer of 1877*, set his expert at it, telling him that the Western Union must have it (complts, iv, 776–7). But above all, we have the fact proved that Dan Drawbaugh borrowed the Western Union Company's telephone at Harrisburg, *in the spring of 1878* (brief, pp. 221–279). Mr. Orton had then got their lines equipped in Harrisburg; and Dan borrowed the Phelps instrument to find out how it was made, in the spring of 1878, and learned how to make telephones from it. But, Mr. Edmunds has forgotten what he knew about it two weeks ago; what he was paid to know; and what he no doubt thought he did know; for Mr. Edmunds is a conscientious man, and would not make a statement that he did not believe to be true. Yet, his memory is so fallible, that he has forgotten in a week the very facts which were the vital foundations of his argument; and he came here and made an argument founded upon the assumption, that even Mr. Orton did not appreciate the telephone until the "summer or fall" of 1878.

If Mr. Edmunds can be so mistaken, — a man with a cultivated intellect, paid to know it, and who spent a year's time to learn it,— how much more likely to forget would be these boors, who were called to testify ten years after an event, and asked to tell about something which they had no interest in, and which never fixed itself in their minds, except as a matter of idle curiosity.

Mr. Hill. — The trouble with Mr. Edmunds was that he was accepting as true the statements of your expert, Mr. Pope.

Mr. Dickerson. — You are putting your foot into it again. If you want to see that explanation knocked down, I will do it for you. The expert, Pope, said, in his examination at first, that it was 1878. The master got it down so. He came back the next morning, and said, "There is a mistake here; it was 1877." Then you called him, and examined him on the 1877 date taken out of another record.

Mr. Hill. — Where is the evidence as to that?

Mr. Dickerson. — I tell you that that is exactly true. I do not want to take my time to chase up these things now, but I will, and it is true.

By a slip of the tongue, perhaps, or a mistake of the examiner, Mr. Pope said it was in 1878, on p. 1287, but on p. 1303 he corrected it and fixed the true date as 1877, and then reported the date of Mr. Orton's determination to have it as August, 1877, as he had testified in a deposition given in 1879 (complts, iv, 7757). There was no mistake about this, for Mr. Hill put in evidence that earlier deposition, and examined Mr. Pope on it as of the correct date (complts, ii, 1453); and in the very sentence in the brief in which he charged Mr. Orton as not doing the thing till 1878, they give a reference to Mr. Pope's deposition (p. 1427, x 310) in which you asked a question, and brought out the date of August, 1877, as the time when Mr. Pope was "working on his report" to Mr. Orton.

And it is enough to say that in the spring of 1878 this fellow was borrowing our instruments in Harrisburg. The telephone lines had then been established. It was the Western Union line then, because they infringed the patent, and spread the telephone upon their lines, with all the power which that great corporation had; and Mr. Orton was doing it in 1877. Mr. Orton, the president of the Western Union Company, was a great man; he saw at once, and he said, that his company must have this improvement; therefore his employé, Mr. Pope, was engaged on it, and he made a contract with Dolbear for the ideas which he had, in the summer of 1877; because they were building up their line with these outside patents and ideas, in order to give Mr. Bell an opportunity to prove his title; and he proved it.

Then my brother Edmunds said that what many men had sworn to must be accepted, notwithstanding any *conduct* that stands in the way. Well, sir, he would not act in that way in his own life; and no man else would. That which is to be believed must be consistent with the God-given laws that govern human conduct. No man can be believed who comes and tells you that which no other human being ever would do or ever could do, so far as human experience goes. The law has laid that down as a maxim. It has done it, not only for the protection of property, but for the preservation of truth. If it were not so, — if a gang of fellows could be picked up to swear away our rights, when the conduct of everybody connected with it had been exactly contrary to the theory on which they were swearing, where would be our rights, and where would be the truth?

Then my brother Edmunds said that it is impossible that an instrument like **B** can *look* so old unless *it is old*. Well, I have had this electro-magnet unscrewed for the purpose of answering that suggestion. Here is **B**. This block has been screwed down to a board, and I now remove it, and you see that the wood under the block is exactly the same old looking wood as the rest. If this had been screwed down on a new board, and it then had grown old, — and they want you to believe it is seventeen years old, — this covered part would have looked new and the exposed part would have looked old. It was screwed down on an old piece of board when the thing was made, as is evident on inspection.

Another thing. They tell you that Dan used that old battered tin can for *nine years* as his instrument. Let me show it to you. That tin strap over the can has never been taken off. There is one *tack* in it at each end, and neither has ever been drawn. You cannot put the tack back again in an old hole if once drawn; it must make a new one, or it will not hold, and *there is only one hole*. You cannot pull this can out from the strap, and put on a new bladder, and replace it again. That thing was made in 1876, after the *Scientific American* description of Bell's telephone. It was tried and thrown away; and just as fast as he could, Dan stepped right on in the track that was before him. He made the other thing, — the Reis instrument, — and then he made the other things of that kind that came to be the exhibits in this case, as fast as he saw them outside. That is the history of it.

Our résumé is that this man stands in the presence of a cloud of witnesses who must have known that he was the inventor, if he had been. His partners, men of character and capital, were all tied up with him together in that little building, and NONE OF THEM EVER SAW IT OR HEARD OF IT. He told Matthews that he was not the inventor. He told Weaver that he was not the inventor. He told Chellis that *he did not know* that he was the inventor. He wrote his own biography in 1878, and it was published, in which he did not claim to be the inventor of "*the telephone*," but only of "*several kinds of telephones*," which at that time he was trying to invent. When this quartette was formed, or before that time, they advised that Dan's devices were not worth spending $15 or $35 upon; that it was not worth while to go to the Patent Office and put in an application which would have stood as a bar to the statute of limitations, then running against his claim. Just look at it! Hill, this expert patent agent, coming there from Washington, having shown to him **D** and **E**, **H**, **L** and **M**, and all those things in existence before any of the Bell inventions had been made, so far as he knew, and certainly long before the Blake transmitter was thought of; and knowing, as he did know, that the statute of limitations was running against the claim, advising that it was not worth while to spend $15 on!!

Hill, Dan Drawbaugh, Chellis, Jacobs, Moffitt, and the rest stood around that table, and went away, after deciding that it was not worth while to spend $15 or $35 on Drawbaugh's inventions, whatever they were. Then, when there was a crowd assembled to rob Professor Bell of his invention by infringing it, then this same quartette came together and said, "Dan, give us three fourths of the title to your story. We will defeat Bell with it: you must do what swearing you can to kill him." Then they took $20,000, and this huge pile of stock, and have carried on this case to its present termination.

Against the inferences of that, against all the conclusions that the human mind draws from these premises, what have they to offer? Not a scrap of paper. Not a record. At best, nothing but the naked memory of uneducated boors, that eight, ten or twelve years ago, they saw all these things; yet no one of them has described them; no one understands how they work; no one pretends to; but they simply say that they saw the outside of the exhibit; and some of them say that they heard somebody else say, that they had heard somebody else say, that Dan Drawbaugh was the inventor. It does not rise to the dignity of a question. It is a roaring farce.

Sir, I stand here representing tremendous interests. I deeply feel the weight of the great responsibility that is resting upon me;

and I cannot leave the case without begging of you the most careful consideration of it; in view of the fact that these great bodies of vested rights are at stake, and that your decision either will spread consternation over the length and breadth of this land, or else it will assure the owners of this property in the protection of that title which they, relying on this man's conduct, have for years thought was safe. Look at Drawbaugh,— walking into our office, and borrowing our instrument, never saying a word against our rights, never opening his lips to claim them. Relying upon such conduct, they have invested their money; they had no doubt about the legal conclusions from that conduct, and they are now called upon to say why they should not be stripped of their property, because he, and his gang of loafers, come here and swear that they have seen things in years gone by which his partners think should defeat the title under which these owners have invested their money and thus far have been protected in their rights. I have done.

IN THE

UNITED STATES SUPREME COURT.

OCTOBER TERM, A. D. 1886.

THE PEOPLE'S TELEPHONE COMPANY ET AL.,
Appellants,
vs.
THE AMERICAN BELL TELEPHONE COMPANY ET AL.,
Appellees.

THE OVERLAND TELEPHONE COMPANY ET AL.,
Appellants,
vs.
THE AMERICAN BELL TELEPHONE COMPANY ET AL.,
Appellees.

STATEMENT OF ERRORS.

1. The court below erred in holding the Bell patents in suit, or either of them, valid.

2. It erred in holding said patents, or either of them, to have been infringed by the defendants, or any of them.

3. It erred in holding that Daniel Drawbaugh was not the first and original inventor of the inventions here in suit.

4. It erred in not holding Elisha Gray to have invented the electric speaking telephone, in its variable resistance

5. It erred in not holding the Bell patent of March 7, 1876, here in suit, to be fraudulent and void, in view of the evidence as to fraudulent changes in the application therefor, and the fraudulent introduction of Gray's inventions into said application, while pending in the patent office.

6. It erred in not holding the Bell patent of January 30, 1877, here in suit, to be fraudulent and void, in view of the evidence as to the fraudulent introduction of Elisha Gray's said inventions into the same.

7. It erred in not holding Bell to have surreptitiously and unjustly obtained both of said patents for that which was in fact invented by another (to wit: by Elisha Gray), who was using reasonable diligence in adapting and perfecting the same.

8. It erred in not holding Bell to have surreptitiously and unjustly obtained both of said patents for that which was in fact invented by another (to wit: by Daniel Drawbaugh), who was using reasonable diligence in adapting and perfecting the same in his various improved instruments.

9. It erred in not dismissing the appellees' bill for want of equity and right, in view of the frauds shown by the appellees' own evidence to have been perpetrated upon the Patent Office, Elisha Gray and the public in the procurement of the patents, and remaining in the patents, on which said bill is founded.

10. It erred in construing said patent of March 7, 1876, here in suit, to cover anything more than a magneto-electric current generated by the vibration, by sound waves, of a body of inductive material in the presence of a body susceptible of receiving induction therefrom; and it further erred in not holding such a patent for a *current* to be a

patent for an "effect," "mode of operation" or "principle," and therefore void.

11. It erred in not holding said patent of March 7, 1876, to be limited to the described apparatus of its figure 7—there being, as the appellees contend, no "art" then known, and there being no equivalents for this apparatus described in the specification.

12. It erred in not holding said patent of January 30, 1877, to be invalid and void, by reason of its claiming matters described and shown, but not claimed in Bell's prior patent of March 7, 1876, the application not having been filed till after the former patent was issued, and said matters not having been reserved in said prior patent as matters to be afterwards applied for, but having been abandoned to the public by describing and showing without claiming them, in said prior patent.

13. It erred in not limiting the scope of the claims of the patent of January 30, 1877, here in suit, to mere improvements in the form of the parts mentioned in said claims.

14. It erred in holding that the specification of Bell's patent of March 7, 1876, describes the speaking telephone invention with the clearness, fullness and exactness which the statute requires in such cases; and that the patent is not invalid for want of a proper description and specification of said alleged invention.

15. It erred in holding that Bell, in the sense of the patent law, completed or made any invention of an electric speaking telephone before a date later than March 7, 1876; and, therefore, in not holding the patent void, as being for an invention not made, at or prior to its date, by the patentee.

16. It erred, throughout its opinions in the case

against the People's Telephone Company, in treating of the evidence as to Drawbaugh's priority of invention, by ignoring, misconstruing, misstating, and misunderstanding the evidence; by assuming things of which there was no evidence, or which were contrary to the evidence; by misunderstanding and misapplying the law; and by attributing different degrees of probative force to the same kinds of evidence accordingly as it found the same on the one side or on the other side of the case. These errors are too numerous to be set out here in detail, but reference for them is to be made to appellants' brief on the Drawbaugh evidence herewith filed, pages 277 to 311 inclusive, where the same are set forth in detail.

L. HILL,
Of Counsel for the People's Telephone Co.,
and the Overland Telephone Co., Appellants.

IN THE

Supreme Court of the United States.

THE PEOPLE'S TELEPHONE CO. ET ALS.,
Appellants,
vs.
THE AMERICAN BELL TELEPHONE CO. ET ALS.,
Appellees.
No. 1164.

THE OVERLAND TELEPHONE CO. ET AL.,
Appellants,
vs.
THE AMERICAN BELL TELEPHONE CO. ET AL.,
Appellees.
No. 1165.

THE SUIT AND ITS DEFENSES.

The appellants here were the defendants below. The suits are founded upon the patents granted to Alexander Graham Bell, No. 174,465, dated March 7, 1876, application filed February 14, 1876, for "Improvement in Telegraphy," and No. 186,787, dated January 30, 1877, for "Improvements in Electric Telephony."

The defense is, first, a denial of the validity of both of said patents, on the ground that Alexander Graham Bell was not the original and first inventor of any of the inventions claimed therein, constituting or applicable in con-

nection with electric speaking telephones, but that Daniel Drawbaugh, of Eberly's Mills, otherwise known as Milltown, Cumberland county, Pennsylvania, was the original and first inventor of all such inventions and improvements described and claimed in said two patents, or in either of them.

Secondly, a denial that either of the said Bell patents is infringed by the defendants.

Thirdly, a denial that either of said Bell patents is valid in law.

Fourthly, a denial that Bell had achieved the invention of the electric speaking telephone at the date of his patent of March 7, 1876.

Fifthly, a denial that the matters decribed in said patent of March 7, 1876, were original with Bell. The appellants will maintain that he derived many of them from Elisha Gray, a prior inventor of the electric speaking telephone.

Sixthly, a denial that the matters described in Bell's patent of January 30, 1877, were original with Bell. The appellants will maintain that he derived many of them from said Gray.

Seventhly, a denial that Bell had any right to incorporate into either of his said patents any principles, inventions, methods, or devices, knowledge of which he derived from said Gray, and that his patents have any validity, in view of the fact that he so appropriated Gray's inventions.

A separate brief will be filed herewith, in which all the questions raised by the appellants, except the Drawbaugh defense, will be discussed independently.

The Drawbaugh defense alone will be discussed in the present brief.

This division of the subject matters of defense is adopted for greater clearness and convenience, both to court and counsel.*

I.

SKETCH OF DANIEL DRAWBAUGH'S HISTORY, CHARACTER, POVERTY, AND INVENTIVE INGENUITY.

Daniel Drawbaugh was born in the year 1827, and has lived nearly all his life in the little village or hamlet of Eberly's Mills, otherwise called Milltown, Cumberland county, Pennsylvania, on the Yellow Breeches creek, about three miles south-east from Harrisburg. His residence in that village has been continuous from a period before the rebellion to the present time, with the exception of the one year, from April 1, 1876, to April 1, 1877, when he resided at Mechanicsburg, five miles away, but worked in his shop at Milltown, going home Saturday evenings and returning to his shop Monday mornings.

(D. Drawbaugh, D. Vol. 2, pp. 749 to 1027, answers 2, 3, 4, 5, 547, 548, 580, 633, 1474; J. B. Drawbaugh, Vol. 1, p. 593; Fettrow, Id. p. 347; Springer, Id. p. 182, Ans. 6, 55, etc.)

From the year 1856 to the fall of 1867 or winter following, he had his workshop in the basement or first story of a house closely adjoining Eberly's grist-mill, but at the latter date he began to occupy a shop two or three

I.

SKETCH OF DANIEL DRAWBAUGH'S HISTORY, CHARACTER, POVERTY, AND INVENTIVE INGENUITY.

Daniel Drawbaugh was born in the year 1827, and has lived nearly all his life in the little village or hamlet of Eberly's Mills, otherwise called Milltown, Cumberland county, Pennsylvania, on the Yellow Breeches creek, about three miles south-east from Harrisburg. His residence in that village has been continuous from a period before the rebellion to the present time, with the exception of the one year, from April 1, 1876, to April 1, 1877, when he resided at Mechanicsburg, five miles away, but worked in his shop at Milltown, going home Saturday evenings and returning to his shop Monday mornings.

(D. Drawbaugh, D. Vol. 2, pp. 749 to 1027, answers 2, 3, 4, 5, 547, 548, 580, 633, 1474; J. B. Drawbaugh, Vol. 1, p. 593; Fettrow, Id. p. 347; Springer, Id. p. 182, Ans. 6, 55, etc.)

From the year 1856 to the fall of 1867 or winter following, he had his workshop in the basement or first story of a house closely adjoining Eberly's grist-mill, but at the latter date he began to occupy a shop two or three

---

NOTE. The appellee's four volumes of proofs will be cited in this brief as C, vol. 1, C, vol. 2, C, vol. 3, C, exhibits, or vol. 4—C, meaning complainant below.

The appellant's six volumes will be cited as D, vol. 1, D, vol. 2, D, S.-reb., D, S.-rej., D, exhibits, and Add. Proofs—D, meaning defendant below.

hundred yards below, on the bank of the Yellow Breeches and has occupied it ever since. (Id. Ans. 8, 10, 11, 12, 13; H. B. Eberly, D. Vol. 1, p. 287, Ans. 40.)

From 1856 to April 1, 1868, he lived in the house adjoining the grist-mill; at the latter date he purchased and occupied a house on the opposite side of the road, not far from the grist-mill; this latter property he sold to D. Fettrow in the spring of 1876, when he moved to Mechanicsburgh, and on his return from Mechanicsburg in the spring of 1877, he moved into a house opposite the grist-mill and occupied it one year, after which he again moved into the house adjoining the grist-mill, and has lived there ever since.

(D. Drawbaugh, Id., Ans. 6, 8, 479, 480, 548, 1474, 1475.)

These various localities, *as they existed in the year 1872*, are fairly shown by the map of of Eberly's Mills and vicinity, appended at the end of complainant's exhibits.

Mr. Drawbaugh's school education was limited. He attended the common schools parts of three to five winters, but ceased to attend school at the age of fifteen or sixteen.

(D. Drawbaugh, Id., p. 866, Ans. 619, 620, 621.)

His opportunities for acquiring scientific and mechanical information from printed publications, have been limited. He was a reader of the Scientific American at an early period (Id., Ans. 809, p. 899) (but let his subscription run out about 1869 or 1870, from want of money; Ans. 1569, 1570), and had in his possession a few books (same answer and answers 1009, p. 939, and 1017, pp. 941, 942), among which were Comstock's Philosophy, Parker's Philosophy, Youman's Chemistry, two volumes of Tomlinson's Cyclopedia of Useful Arts, and a publication on the international exposition of 1851; and prior to the spring of 1860 he attended certain courses of lectures on physics, delivered by Prof. Heiges, in a school-house near Milltown, and *was, even at that early date*, contemplating the transmission of speech through a telegraphic wire by electricity, and believed that it could and would be accomplished. (Prof. S. B. Heiges, D. S-reb., pp. 95–97, answers 1–14.)

He was "an enthusiast on the subject of physics at that early time." (G. W. Heiges, C. Vol. 2. p. 1095, Ans. 21.) He was familiar with the Everitt Acoustic Telegraph, and with the Leon Scott phonautograph, from about the end of the year 1863 (D. Vol. 2, p. 1067), and with the Ries telephone in the fall of 1876 (Id. pp. 1056, 1064, 1067.) "The subject of electricity seemed to be his hobby." (Dr. C. E. Updegraff, D. Vol. 2, p. 1087, Ans. 33.) And this is confirmed by all the witnesses in the case, both for the complainants and the defendants.

From his boyhood, he was a person of remarkable mechanical ingenuity and natural skill. At the early age of thirteen, he made a rifle for Daniel Balsey (Balsey, D. Vol. 1, p. 195, Ans. 29) and at a later date was exceedingly skillful in wood-working. (Id. pp. 195, 196, Ans. 31, 42, 43.) When about ten or twelve years old, he made part of a clock; and at the age of from fifteen to seventeen he made a small steam-engine and an automatic machine for sawing wagon-felloes, the latter being of his own invention. (D. Vol. 2, p. 895, Ans. 790.) About the years 1857–9 he constructed and operated photographic apparatus, making even the lenses himself. (D. Vol. 2, pp. 900, 901.) He constructed, at one time, for his own use, a solar transit, by which to test the regularity of his magnetic clocks (Id., pp. 957, 971), and, at another time, a machine for wrapping electric wire (Id., p. 960.). He made his own galvanometers (Id., pp. 939 to 941). Nearly all the witnesses in the case bear testimony to his skill as a workman, and even Weaver, hostile as he is, was obliged to declare (C. Vol. 1, p. 380, Ans. 28) that Drawbaugh, in 1868, had such a reputation as a machinist "that very few men would venture to offer advice to him." He was a "first-class" workman. (J. C. Smith, D. Vol. 1, p. 342, Ans. 95.) He was applied to by others to invent machines for them (Weaver, C. Vol. 1, p. 377, Ans. 9; D. Drawbaugh, D. Vol. 2, p. 968, Ans. 1134; same page, Ans., 1133; p. 969, Ans. 1140), and, in consequence of such applications invented not only the tack machine for Patton, the paper-bag machine for Singiser, and the machine for stemming grapes for Hertzler, but (D. Vol. 2, p. 898, Ans. 804) a great variety of machines about 1867 for the pump company and (Id., p. 970, Ans. 1144), a large number of machines and tools about 1874 or 1875 for the axle company. A considerable number of his inventions are enumerated in his answer 791, D. Vol. 2, p. 895, and again on pp. 1061, 1062, where he testifies to their successful mechanical operation.

"He was looked upon as a man who could invent most anything." (D. H. Good, D. Vol 1, p. 508, Cross-ans. 22.)

"He was a great mechanical genius." (*Morley*, complainants' witness. C. Vol. 2, p. 1553, Ans. 9.)

"He was a great inventor—I knew that." (Edward Nichols, complainants' witness, C. Vol. 1, p. 864, Ans. 102.)

In Wing's History of Cumberland county, Pennsylvania, published in 1879, he is referred to as "An inventive "genius of whom our country may feel justly proud." (C. Vol. 1, p. 707.)

Like most great inventive geniuses, he was not equally great as a financier, the continuous and intense mental application necessary to the conception and development of inventions, and the overcoming of mechanical obstacles, rendering it almost impossible for them to give much, if any, attention to the acquisition and successful management of property. His wife testifies (D. Add. Proofs, p. 224, Ans., 39–42) that he was a very poor business manager, very negligent about collecting his dues, easily letting money slip through his fingers, and of such generous impulses that, even when very poor himself, he was unable to say "No" to any demand for charitable or other purposes. At the opening of the rebellion he was manufacturing his patented stave machinery and selling it principally in the south. The beginning of hostilities caught him with his machines, unpaid for, in the south, and his liabilities in the north, and he was thereby bankrupted. (D. Vol. 2, p. 843, Ans. 490.) He lived in a small hamlet, in the midst of an agricultural community, where there was little or no business, and, from his failure until the summer of 1867, earned his subsistence by doing such small jobs of repairing as came to hand. During that period he was not doing a paying business, was poor, and in need of a good many necessary articles. (D. Vol. 2, pp. 843, 844, Ans. 491, 492.) His finances were very low, and he was considerably in debt. (Id., p. 832, Ans. 427, 428.) His brother, Esquire John B. Drawbaugh, testifies (D. Vol. 1, pp. 594, 595) as follows:

"Q. 160. You have referred to your brother Daniel's being poor and in debt, at the time when he sold his faucet and pump to Gardiner, Gorgas and others; do you know anything about his meeting with heavy losses, for a poor man, and becoming involved in debt in consequence of it, by a transaction which occurred about the beginning of the rebellion, in the latter part of 1860, or early part of 1861?

"A. I do.

"Q. 161. Do you remember what amount of money Dan lost in that transaction?

"A. I heard him say about that time that his expenses and labor on manufacturing those machines was about twenty-five hundred dollars.

"Q. 162. That loss was occasioned by the sale of machines and patent rights in the south, just before the rebellion, the proceeds of which could not be collected by reason of the war; was it not?

"A. Yes, sir.

"Q. 163. Do you know whether at the time when he sold his faucet and pump to Gorgas and others, he was still embarrassed by debts growing out of that old transaction?

"A. He was."

He never received a cent of that money after the starting of the rebellion. (D. Vol. 2, p. 843, Ans. 490.)

In 1867 his financial prospects brightened a little, and he undoubtedly thought himself at last on the road to prosperity; but his hopes were delusive and his prosperity short-lived. By the latter part of 1869 he was substantially out of employment, and as poor as ever. The circumstances were as follows:

In 1866 he had patented a faucet and pump. Prior to May, 1867, he had sold one-half of the faucet invention to A. H. Gardner for $1,000. He did not get the money for two years thereafter, but, finally, about April 1, 1869, he raised the money on Gardner's note by becoming surety upon it himself, getting some of his friends to endorse it, and getting it discounted. Gardner did not pay the note, and the result was that afterwards, in April, 1872, judgment was entered against the principal and sureties, *and a lien of $1,000 and interest thereby became in force upon any property that Drawbaugh had.* (D. vol. 2, pp. 833, 834.) At the time when he received this $1,000 his father and mother were very aged, helpless and poor, and Daniel Drawbaugh with his brother Henry and a brother-in-law united together to buy and furnish them a little home, each agreeing to contribute his quota to the expense. Daniel applied the $1,000 to this excellent purpose; Henry furnished his quota; but the brother-in-law was delinquent and Henry had to make up the deficiency, as Daniel was unable to contribute any further. The transaction cost Henry $2,700. At the death of their father in December, 1878, the property had so depreciated in value and was so exhausted by the old gentleman's debts that there remained not one cent for the heirs. Henry had to bury his father and to pay his remaining debts, Daniel being unable to assist, by reason of his own poverty. The $1,000 received from the Gardner note, was, therefore, lost, and Daniel Drawbaugh was involved in a liability of $1,000 and interest as surety on the note. The whole transaction is detailed in the testimony of Daniel Drawbaugh (D. vol. 2, pp. 834, 835) and Henry F. Drawbaugh (D. vol. 1, pp. 399, 403).

It appears from the testimony of W. L. Gorgas (D. Vol. 1, p. 647) and others, that in May, 1867, Mr. Drawbaugh and five of his neighbors bought from him his patent right on pumps at the price of $6,000, toward which the other five contributed $5,000 and he contributed $1,000, so that he was to receive for his patent right $5,000 and a one-sixth interest in the stock of the company. The company purchased machinery, rented an old clover-mill two or three hundred yards below

Eberly's grist-mill, employed Drawbaugh as superintendent, and commenced operations. In the fall of 1867 Gardner and his associates in the faucet united with the pump company, and its membership was thereby increased to nine persons. Drawbaugh moved his own tools into the clover-mill and has ever since occupied it as his workshop. It was an old wooden building, having a basement or cellar, two stories and an attic, and had in the basement a small water-wheel for driving the machinery.

This company held its first meeting on May 24, 1867, and held meetings pretty regularly till December 5, 1870, Between the meetings of October 22, 1870, and December 5, 1870, there was a meeting at which it was decided to suspend operations, and the company then and there substantially closed its business operations. (C. Vol. 2, pp. 1147, 1148, and answer 128, p. 1151.) It held only two meetings after December 5, 1870, viz.: one July 19, 1873, (C. Vol. 2, p. 1148, and answer 126, p. 1150), on which date the company, having then recently sold out its property to Hauck Brothers & Co., went into liquidation (Id., p. 1131, and answer 20), and one on May 1, 1876, for final settlement of all its matters. (Id. and also Gorgas, D. Vol. 1, p. 647 *et seq.*) The business of the company, thus suspended in the fall of 1870 and never resumed, was financially unsuccessful. No dividends were ever declared (Gorgas, Id., answer 16, p. 649, and 29, p. 653), but larger assessments were made upon the members during the period of its active operations. Drawbaugh did not receive his $5,000 in cash at the time of forming the company, but received a portion in cash and the balance in notes from the other members, which notes were paid along from time to time, in instalments, during

1867 and 1868. (Drawbaugh, D. Vol. 2, pp. 837 to 842.) The assessments made upon him by the company amounted to $2,186.33, against which he was credited on July 25, 1870, with his labor to the amount of $885. (Gorgas, D. Vol. 1, answer 23, p. 651.) He actually paid into the company cash assessments of $1,210 (Gorgas, Id., answers 20, 21, 22), and contributed his labor for several years in lieu of paying the balance of his assessments in cash. All the money and other articles that he received from the company on his wages account during the five years from the beginning of its operations, were as follows:

In the year 1867	$115 00
" " " 1868	13 20
" " " 1869	37 39
" " " 1870	13 38
" " " 1871	62 58

Believing himself in the fall of 1867 to be entering upon a condition of comparative prosperity, he purchased the dwelling house and blacksmith shop about one hundred yards west from Eberly's grist mill, for the sum of $2,310.00, on which he at the time paid $2,000 out of the money received from the sale of the patent right to the company. (D. Vol. 2, Ans., 478 to 485, pp. 841, 842.) About the same time he paid old debts to the amount of $1,000 or *more* out of the same proceeds. (Id. Ans. 488, p. 843; and see testimony of J. K. Taylor, D. Vol. I, pp. 633, 634, Ans. 1 to 5.) He was unable to pay in full the purchase money for his homestead, but left a judgment of about $300, in favor of one Neidhamer, standing as a lien upon it. (Id., p. 842, Ans. 484.) He was obliged to put repairs upon the house, the amount of which he cannot state, but estimates at between three and four hundred dollars. (Id., p. 849, Ans. 521, 522.) He also had to contribute for his parents, besides the $1,000 for a home, other moneys for furnishing it and for necessary articles for their use, to the amount of not less than four hundred dollars in all. (Id., p. 844, Ans. 493, 494, 495.)

It appears, therefore, that from the beginning of May, 1867, to the end of the year 1870 he received—

From pump company....................	$5,000 00
From Gardner note discount..............	1,000 00
From company on labor account..........	179 27
Total receipts....................	$6,179 27

and that he paid out—

For old debts........................	$1,000 00
For homestead........................	2,000 00
For repairs on homestead...............	300 00
For parents' homestead.................	1,000 00
For parents..........................	400 00
For assessments.......................	1,210 00
Total........................	$5,910 00
Leaving a balance of..................	$ 269 27

to be applied for his own support and that of his family in a period of nearly four years. He did a little work in the shop on his own account during this period (D. Vol. 2, p. 846, Ans. 506), and rented a portion of his house to Daniel Fettrow from the spring of 1868 and for eight years thereafter, for which Fettrow paid him $80 for the year 1868, and $110 per year after that time. (Fettrow, D. Vol. 1, pp. 353, 354.) Assuming that he earned $100 per year by these odd jobs, which is probably too large an estimate, we find that his resources from May 1, 1867, to the end of 1870, for the support of himself and family, were:

Cash from C. applied for that purpose.......	$269 27
Rent received from Fettrow................	320 00
Earned by odd jobs......................	360 00
Total..............................	$949 27

about twenty-two dollars per month—a little over seventy-five cents per day.

During that period he had no other financial resources than those hereinabove set forth (D. Vol. 2, p. 845, Ans. 500).

Yet, in all his career from 1860 to 1880, this period, consisting of the years 1867, 1868, 1869, and perhaps the early part of 1870, was, financially, the "flush" period of his life!

The money from his associates in the company came in driblets, and he had to borrow money to get along, in one instance (through the aid of Mr. Gorgas) making a loan of $400 dollars or more from David Ditlow, which encumbered him for years afterward. (Id. pp. 845, 846, 847, 848, 849.) This loan he was compelled to make, in order to meet an assessment and save his interest in the company (Id. Ans. 509, p. 847), and he probably used some of it for the support of his family, as he was at that time hard pressed for their support. (Id. p. 847, Ans. 510, 511.) This note was curtailed and renewed for $200, on April 4, 1870, payable in one year (Id. p. 849). In 1874, fifty dollars of it still remained due (Id. p. 849), and the debt was finally canceled in 1881. (Ans. 520, p. 849.)

At the end of the year 1870, his financial situation was, therefore, substantially as follows: He owned a homestead worth $2,300 four years before, which was now encumbered to the amount of more than $1,900, by reason of the $300 Neidhamer lien for a portion of the original purchase money, the $600 lien of William Drawbaugh (D. Exhibits p. 29), and the $1,000 judgment note given April 1, 1869 (D. Exhibits, p. 39), and known as the Gardner note, to which reference has already been made; he was out of employment, and hard pressed to support his family; and he owed David Ditlow $200, and probably had other debts to a considerably greater amount. One note to Malehorn, dated March 29, 1870, for $133.97, and upon which suit was brought, appears in D. Exhibits, p. 32.

During the years 1871, 1872, and down to July, 1873, when the company's property was sold out to the Haucks, he had no regular and steady employment and no regular and steady income, but subsisted upon what odd jobs he could get to do in the shop. (Ans. 508, p. 547, D. Vol. 2.) At one time, in 1871 or 1872, he tried, in connection with Jacob M. Sadler, to eke out his slender means of living by making a few hydraulic rams, Sadler furnishing the small capital for the enterprise, and getting orders for the rams, and Drawbaugh doing the work; but the business amounted to little or nothing and was soon abandoned. (See W. Sadler, C. Vol. 1, pp. 1036–1054; Ans. 26–33, 87–97, 119.) During this period he was subjected to extraordinary troubles, both financial and domestic. In November, 1871, he lost two of his children by death—Ida, aged about nine years, and Emma, aged about fifteen (D. Vol. 2, p. 751; C. Vol. 1, pp. 905 to 908), —and for a long time thereafter had another child ill and so emaciated by disease as to attract people to the house from curiosity to see it (Z. Bowman, D. Vol. 1, pp. 612, 613; H. F. Drawbaugh, Id., Ans. 52, p. 420; Karns, C. Vol. 1, Ans. 163, p. 905), and another child substantially an invalid. (D. Vol. 1, Ans. 52, p. 402; D. Vol. 2, Ans. 17, 18, p. 751.) His family were scarcely ever without sickness, and he was too poor to procure them the medicines which they required (H. F. Drawbaugh, D. Vol. 1, Ans. 52, p. 402.) He was unable to pay the physician who attended his family, and was sued by him on February 10, 1873, for a bill of $122.67. (D. Vol. 2, pp. 852, and record of judgment in D. Exhibits, pp. 51, 52.)

On July 19, 1873, he received $425 from the distribution of the proceeds of sale of the company's property to the Haucks (Gorgas, D. Vol. 1, p. 654, Ans. 32). Of this sum he was immediately compelled, on August 1st, 1873, to pay $45 on Dr. Bowman's judgment for medical attendance (D. Vol. 2, p. 852) and nearly all the balance was paid out on the old Neidhamer judgment lien for $300, of more than six years' standing, which the holders were pressing at the time. (Id. p. 858.) This judgment he had not paid off before that time because he had not the money (Id. Ans. 531, p. 851), and interest had accumulated on it at the time when it was paid. (Ans. 532, p. 851.)

The interest on the Neidhamer judgment was at least $18 per year, and that on the Ditlow note was $12 per year (D. Vol. 2, p. 848, Ans. 517), to which must be added his taxes, and, if he was able to insure, his insurance and any interest accruing on his other debts.

The small sum received from the company's distribution in 1873, was, therefore, absorbed as soon as received in quieting the claims of pressing judgment creditors and note holders. It is possible that a small portion of it was paid on the David Ditlow note, which appears to have been running for the original amount of $200 in April, 1873, (D. Vol. 2, p. 848, Ans. 517, endorsement of interest on that date) but was reduced to $50 as early as April 9, 1874 (see note in curtail on p. 849, D. Vol. 2).

From July, 1873, to the time when he moved to Mechanicsburg, about April 1, 1876, he was not making money enough to pay his necessary expenses and keep even with the world, but was getting deeper and deeper into debt all the time. (D. Vol. 2, p. 854, Ans. 547.)

In 1874, Capt. J. A. Moore, Jacob Kline, Wilson Bear and M. M. Grove formed a co-partnership for the manufacture and sale of Kline's patent axles, which co-partnership was known as the "Harrisburg Axle Co.," or "M. M. Grove & Co.," and is generally referred to in the evidence as the "Axle Co." The co-partnership articles were signed Dec. 23, 1874, and it was dissolved on February 9, 1876. (Moore, D. Vol. 1, p. 614.) Moore and Grove, after the dissolution, ran the concern on their own account for a few months, and then Moore took the assets and assumed the debts, and closed it out. This Axle Co. rented from the owners the old clover mill or shop, then occupied by Daniel Drawbaugh as a workshop and used it as their manufactory. They put some new machinery, adapted to their purposes, into the shop *in March, 1875*, (see Moore D. Vol. 1, p. 617; Harman K. Drawbaugh, Id. p. 555; John Wolf, who hauled the machinery to the shop, and exhibits a book account of his charges therefor, D. Vol. 2, p. 674; Daniel Fettrow, Vol. 1, p. 348; Augustus Kahney, D. S.-reb. p. 258, Ans. 38.) The Axle Co. went to work immediately after getting their machinery, in the latter part of March, 1875, (H. K. Drawbaugh, D. Vol. 1, pp. 554-5) and ceased manufacturing axles in the spring of 1876, although they repaired a few reapers, etc. up to harvest (about July 1), 1876. (Moore, Id. p. 615, Ans. 8, 9, 10.) They employed Daniel Drawbaugh to some extent from May 28, 1875, to March 31, 1876, (Moore, Id. pp. 620, 621), and paid him in 1875, $310.22, and in 1876, $143.84, for work done by him.

All along from the time when his great financial distress commenced, during the operations of the Pump and Faucet Company, in 1869 and 1870, Mr. Drawbaugh was desirous of selling his equity in the homestead and using the proceeds to pay off his debts, patent his inventions and get into business, and actually offered it for sale a number of times to different parties, but his wife would not give her consent to sell the house except for the purpose of purchasing another. (D. Vol. 2, p. 867, Ans. 629 to 633; and see his wife's testimony, D. Add. Proofs, pp. 224, 225, where she swears that he frequently importuned her to consent to the sale in order to get means to patent the telephone invention, but she resolutely refused.) The property was worth about $2,000 and was encumbered by judgment liens to the amount of over $1,000, and, with his wife refusing to release her right of dower, it was manifestly impossible for him to sell it or borrow money upon it. In his extreme poverty, she regarded the possession of this home as her only safeguard against the poor-house.

She was bitterly opposed to his spending his time in experimenting and inventing (D. Vol. 1, H. F. Drawbaugh, p. 401, Ans. 46, 47; Daniel Drawbaugh, D. Vol. 2, 831, Ans. 418; Harman K. Drawbaugh, D. Vol. 1, p. 567, Ans. 133; Holsinger, Id., p. 365, Ans. 51, 52; Mrs. Brenneman, D. S-r, p. 106, Ans. 29; Mrs. Brown, Id., p. 164, Ans. 11; Springer, D. Vol. 1, p. 186, Ans. 42, 43;

Chellis, Id., p. 526, Ans. 16; Fettrow, Id., pp. 357–8, and Mrs. Drawbaugh, D. Add. Proofs, p. 222). When he proposed, therefore, to sell the property and invest a portion of its proceeds in securing his inventions, including the telephone (Ans. 631, 632, D. Vol. 2, p. 867), it is no wonder that she declined to give her consent, and resolutely determined that the property should only be exchanged for another home.

In this situation Mr. Drawbaugh decided, in 1875, to effect, if possible, an exchange of this property for a house in Mechanicsburg, hoping to get some more regular employment in that village (D. Vol. 2, p. 867, Ans. 633). He therefore bargained with his tenant, Daniel Fettrow, in August, 1875, to sell the Milltown property to him for $2,200, clear of incumbrances (Fettrow, D. Vol. 1, p. 348, Ans. 13; p. 355, Ans. 75, 76). Fettrow had the title examined, and found the $1,000 lien, and therefore paid Drawbaugh, on getting the deed, about April 1, 1876, only $1,200—of which $50 was paid at the time of the agreement to buy, in August, 1875; $100 was paid on January 28, 1876, and the balançe, $1,050, was paid about April 1, 1876. (Fettrow, *id.*, p. 355; D. Drawbaugh, D. Vol. 2, pp. 854, 855, 856.) Drawbaugh at the same time bought a house in Mechanicsburg, from E. W. Wise, for $1740, of which $1000 was paid in cash, April 1, 1876, and the balance, $740, was to be paid in three annual installments, one payable April 1, 1877, one April 1, 1878, and the remaining one April 1, 1879; all of which deferred payments were secured by judgment notes which were immediately docketed on judgments entered up on them as liens on the Mechanicsburg property (D. Vol. 2, pp. 857, 858, and see Defts. Exhibits, pp. 57, 58, 59, 60.) In the exchange of homesteads, therefore, Drawbaugh received from Fettrow $1200 and paid out to Wise $1000, leaving $200 in his own hands, of which $200 fifty dollars came to hand in August, 1875, and one hundred and fifty dollars on April 1, 1876. He also sold an old cider mill in the summer or fall of 1875, to Hake, a miller, for which he received a small sum of money, taking the balance of the amount in flour and mill-feed. (D. Vol. 2, p. 1063, Ans. 1652–3.) Drawbaugh's pecuniary receipts for the year 1875 were, therefore, so far as we can trace them:

Rent Collected	$110 00
Received on sale of house	50 00
" for Cider Mill, estimated	15 00
" from Axle Co., for wages, etc	310 22
Total	$485 22

In May, 1876, the Haucks who had bought out the old Pump and Faucet Company, on July 1, 1873 (C. Vol. 1, p. 789, Ans. 17) and had manufactured faucets there to some extent, from July 15, 1873, to August, 1874 (Id. p. 190, Ans. 32), and perhaps to a trifling extent afterwards (Id. p. 791, Ans. 30, 31), removed their machinery to Mechanicsburg (Id. p. 789, Ans. 21).

On May 1, 1876, in a final settlement of the old Pump and Faucet Company's accounts, Drawbaugh was allowed and paid $51.13, for labor done by him since the settlement of July 25, 1870. (Gorgas, D. Vol. 1, pp. 651, 652, Ans. 23, etc.) This sum, with the amount paid him for wages by the Axle Co., the amount received from Fettrow and not paid over to Wise, and Fettrow's rent for the year ending April 1, 1876, is the only money we can trace into his hands in the year 1876, the receipts for that year being therefore as follows:

Rent collected	$110 00
Axle Co. for wages	143 84
Cash from Pump Co	51 13
Cash from Exchange of Property	150 00
Total	$454 97

Out of the moneys received in 1876, he paid the balance, about $80, of Dr. Bowman's judgment, and also a judgment of D. H. Good, amounting to about $38, and a bill of Dr. Criswell of about $40, thus reducing the amount available for the support of his family, to $296.97. (D. Vol. 2, p. 859; also D. Exhibits, pp. 51, 55). The expenses of moving to Mechanicsburg, making searches of title and conveyances, &c., undoubtedly further reduced this sum to not over $275. He has no means of ascertaining what other debts he was obliged to pay in 1875 and 1876, but thinks he paid George Leonard, owner of Eberly's grist mill, from $40 to $60. (Id. p. 859.) We can, therefore, readily appreciate the force of his statement in answer 547, (D. Vol. 2, p. 854) that, from July, 1873, to the time when he moved to Mechanicsburg, about April 1, 1876, he was not making money enough to keep his family, but was getting deeper and deeper into debt all the time; and his statement (Id. p. 859, Ans. 579) that, in three weeks from the time when he received the $150 from Fettrow, on April 1, 1876, he had not a cent of it left; and are prepared to believe his further statement in answers 581, 582 (D. Vol. 2, p. 859), that, from April 1, 1876, to the latter part of March, 1878, he "needed money very badly," and was not able to earn enough "to support his family."

From April 1, 1876, till the beginning of this suit, in the fall of 1880, Mr. Drawbaugh had no regular employment for wages. Along towards the spring of 1878 he succeeded in inducing Jacob E. Shettel, Jacob H. Grissinger, and Theodore Grissinger to form, with him, a firm (referred to in the evidence as the Clock Company) for the patenting and manufacturing of his magnetic clock invention, they paying him, on April 1, 1878, $500 for their interest. They commenced operations on that day, in the shop occupied by him, he devoting his time to the work and looking to the prospective profits for his compensation. The business ran along in a slow way for about a year and made no profits, when the Grissingers and Shettle sold out to E. W. Chellis, who had become interested, in January, 1879, in a little improvement in faucets invented by Mr. Drawbaugh. (Shettle, D. Vol. 1, pp. 207 to 224, Ans. 13, 14, 37, 38, 39-44, 62-66, 88-92, 126, 137, 154-161; Chellis, Id., 525, Ans. 1.) Chellis, when he acquired his interest, with Dr. Moffit and Drawbaugh, in Drawbaugh's faucet improvement, paid Mr. Drawbaugh, on January 7, 1879, $250 therefor (Chellis, Id., p. 525, Ans. 1.) These two sums $500 from the clock company, on April 1, 1878, and $250 from Chellis, on January 7, 1879—are all the sums of money, amounting to over a few dollars, that we can trace into Mr. Drawbaugh's hands from the year 1876 to the beginning of this suit, in the fall of 1880. During this long and cheerless period, Mr. Drawbaugh, already deeply in debt, was obliged to subsist upon such little jobs of repairing, etc., as he could get to do, and upon the very small portion of the moneys received from the clock company, and from Chellis, that his creditors left in his hands for that purpose. He had moved back to Milltown about April 1, 1877, and such rents as he may have received from his Mechanicsburg house were necessarily applied to renting a home for his family in Milltown. He had no other resources.

It will be remembered that, from and after April 1, 1876, three judgments were now standing against him in favor of E. W. Wise, and threatening his Mechanicsburg house, upon which they were liens, viz: one for $256.66 and interest, payable April 1, 1877 (D. Exhibits, pp. 59, 60), one for $246.67, with interest, payable April 1, 1879 (Id., pp. 56, 57), and one for $246.67, with interest, payable April 1, 1879 (Id., pp. 57, 58). He seems to have scraped together, or borrowed, $200, paid on the second of these judgments, April 9, 1877 (Id., p. 56). Out of the money received from the clock company, on April 1, 1878, he paid $300 to cancel this judgment and curtail one of the others (Id., pp. 57, 58; D. Vol. 2, p. 858, Ans. 570, pp. 859-60, Ans. 584), leaving in his hands, on April 1, 1878, a balance of $200, of the clock company money, which, however, he was obliged immediately to pay out on other notes and debs overdue (D. Vol. 2, pp. 861 to 865), so that, as Shettel testifies (D. Vol. 1, p. 210, Ans. 45), and Drawbaugh corroborates (D. Vol. 2, p. 863, Ans. 596), in ten days after the clock company paid him the $500, he had not five dollars left. The $250 received from Chellis in January, 1879, was immediately paid out in the same way. His creditors were pressing him for money that he owed, and it was but a short time till he was out of money (Chellis, D. Vol. 1, p. 525, 526, Ans. 1, 6, 7), and in less than a week afterwards he had to borrow from Chellis again in order to get along (Drawbaugh, D. Vol. 2, p. 864). The remaining Wise judgment was unpaid till after the commencement of this suit.

It would seem that nothing could show more clearly than these facts, the extreme poverty and pecuniary helplessness of Mr. Drawbaugh, from the end of the year 1869 till the summer of 1880; but there are in evidence certain corroborating facts, and the testimony of from thirty to forty of his neighbors, that will convince us that the statement above detailed, strong as it is, is utterly inadequate to give us a proper conception of his great destitution during that long period, and his want of financial resources even prior to that period. We will now briefly state this additional evidence.

First, In the above history, we have charged Drawbaugh with receiving from Fettrow, for rent, $80, in 1868, and $110 per year from April 1, 1869, to April 1, 1876. But Fettrow testifies (D. Vol, pp. 353-355, Ans. 63 to 75) that a large portion of this was not paid in cash to Mr. Drawbaugh, but the rent was "generally" paid "through *work* and money paid to him *and other persons*." (Ans. 63.) Fettrow produces his rent-account books, and they, as explained by his (Fettrow) testimony, tell a pitiable story of Drawbaugh's poverty. (See D. Exhibits, pp. 1 to 11, where they are copied in full; and Fettrow's testimony, D. Vol 1, p. 370.) Drawbaugh is charged, on the rent account, with all sorts of articles, such as beef, lard, wood, veal, potatoes, coal, corn, butter, flour, etc. Fettrow, who was a blacksmith, kept none of these things for sale, but testifies that he would, at solicitation of Mr. and Mrs. Drawbaugh, go and buy them for Drawbaugh's family, paying for them himself, and charging them against the rent, because Drawbaugh had not the money to buy them! (Ans. 70, 71.) He also, from time to time, furnished Mrs. Drawbaugh with small items of cash "to keep the family going." (Ans. 74.) Drawbaugh's attention was so engrossed in his inventive labors and experiments that his family was not always provided for. (Ans. 97, 112-114.) Where Fettrow charged Drawbaugh's rent account with work done, money paid, or articles furnished to other persons, it was, of course, in payment of some of Drawbaugh's small debts, which the latter was unable to meet. This state of affairs lasted, as is shown by Fettrow, down to the spring of 1876, when the rent account ceased.

Second, JACOB H. RENCKER (D. Vol. I, pp. 235, 236) testifies to a circumstance in May, 1877, which strikingly illustrates Drawbaugh's extreme poverty at that time. We give it in his own words:

"Q. 30. What called you to his shop frequently during the year 1877, as you have testified?
A. I had some little business with him that year.
Q. 31. What was the nature of that business?
A. *Trying to get some money out of him which I had loaned him.*
Q. 32. When did you loan it to him?
A. In May, 1877.
Q. 33. Under what circumstances?
A. He came to the field where I was working, told me he was very hard up, and wanted me to loan him about twenty dollars, for two weeks, and I gave it to him.
Q. 34. Did he repay that loan all at one time, or a little at a time?
A. Only a little at a time, on different times, but the last in March, 1878.
Q. 35. How small were the partial payments?
A. As small as three dollars, perhaps some less; I don't recollect that.
Q. 36. Please state, if you know, where he got the money to make the final payment, and, if you recollect, what he said to you at that time?
A. *To make the last payment, three or four dollars, he borrowed of the storekeeper at Eberly's Mills; he was very hard up for money, is all that I recollect of him saying.*
Q. 37. At the time you made that loan to him was there any other transaction between you and him?
A. *There was. He wanted to trade me a bureau and secretary combined, on provisions, such as meat, potatoes, butter, eggs and lard, for his family, and we traded in that way.*

Q. 38. Did he, or did he not, at that time say anything about being in want of provisions for his family?

A. *He did say that he needed provisions very bad for his family.*"

This pitiable statement Drawbaugh himself confirms (D. Vol. 2, p. 866) as follows:

"Q. 624. Why did you trade off your bureau and secretary at that time?

A. *I needed provisions for my family.*

Q. 625. Had you no means to get such provisions, except by trading away your household furniture?

A. No, sir, not at that time—I can't—*I had no other means.*"

Third. HERTZLER (D. Vol. 2, pp. 700–702) gives another and still more striking illustration of Drawbaugh's poverty in December, 1878, when his father died.

"Q. 4. Do you remember the time of his father's death, and if so, when was it and what occurred between you and Mr. Drawbaugh?

A. I remember the time, but the date I cannot fix. I remember what occurred, but the year has slipped my memory entirely. He came to my place in the evening, when the next day the funeral of his father was to be, and said that he would like to attend the funeral and wanted to know *if I would give him money enough to pay his way.* I then asked him whether he was going alone. He said his wife should go, *but he was afraid that he could not get the money for them both.* I asked him about the children. He *said that they have not got the clothes.* I think that was the excuse he made about the children, that they had not clothes suitable. I then asked him how much the fare would be to Newville, where his father had lived, and he thought *about ninety cents one way would be the cost of a ticket.* Then I asked him whether he thought five dollars would be enough. He said that it would. I gave him five dollars, and he gave me a due-bill and promised that he would pay it in a very short time. *He never paid it in money. He spoke of it at different times and said that he was ashamed that he could not pay me, but that he would pay it before long.*

Q. 5. *How did he pay that, if he ever did?*

A. *I don't think he ever gave me full value for it; he filed my saws several times and done me favors in that way; he fixed a pruning-shears—put a spring in. I remember that very distinctly.*"

The same witness, who was a near neighbor, testifies (Id., p. 700) as follows:

"Q. 1. Have you any knowledge of his pecuniary condition between the years 1870 and 1880, and if so, state what it was?

A. *He was very poor;* at times he had money, but it did not last very long.

Q. 2. Did you have any transactions with him during that period?

A. Yes, sir; he would very frequently buy as small a quantity as half a peck of apples, and had no money to pay for it; and he would buy lard—about two pounds at a time, and mince meat, generally two pounds at a time, and did not pay for any of it."

Fourth. JACOB E. SHETTEL, one of the Clock Co., testifies "to Drawbaugh's continuous poverty from 1869 or 1870 to 1878" (D. Vol. 1, p. 213, Ans. 67); and to his pecuniary condition in 1878 when Shettel was associated with him as follows (D. Vol. 1., p. 211):

"Q. 47. Do you know whether he was in debt a good deal, or not, at that time?

A. Yes, sir; he told me that he owed considerable.

Q. 48. Do you know what his financial condition was during the year 1878? If so, what was it?

A. Yes, sir, it was pretty poor; he told me that he didn't have any money to get what he really should have for his family.

Q. 49. When did he tell you that?

A. Along during the year 1878.

Q. 50. State any other fact that you remember bearing on the subject of his poverty during that year?

A. We came to Harrisburg at various times during that summer, and *he didn't have the money to pay his toll,* *five cents, across the bridge, and paid it for him different times;* and also, *he didn't have money to buy tobacco for himself, and I bought that for him several times;* and *I several times gave him a dollar, when we were over here, to buy groceries for himself.*"

Fifth. George Leonard, the owner of the grist-mill (C. Vol. 2, pp. 1,200, 1,201, 1,205, Ans. 3, 4, 5, 6, 27, 28, 29), testifies to a fact which shows Drawbaugh's poverty in 1873, 1874, 1875 and thereafter. Kissinger kept a small store at Milltown, prior to the spring of 1874, and owed Leonard a bill. Drawbaugh owed Leonard and also owed Kissinger for goods purchased at the store, neither of which bills was he able to pay. So Kissinger, in April, 1873, gave Leonard a promissory note for $60, which Drawbaugh endorsed and agreed to pay, in order, evidently, to get time on his liability to Kissinger. The note ran along, unpaid, till December 31, 1875, and meanwhile Drawbaugh was becoming indebted to Leonard for other supplies procured from time to time. On December 31, 1875, the whole was consolidated in a new note for $103, which ran till Drawbaugh received the $500 from the Clock Co. before he could find means to curtail it (Leonard, Id.; Drawbaugh, D. Vol. 2, pp. 860–1), and then only to the amount of $50 (p. 861).

Sixth. By reference to pp. 863, 864, D. Vol. 2, we find that on March 13, 1877, Drawbaugh bought two shoats from John Rennard, at public sale, for $15.50. He was not only obliged to give a note for this trifling sum, *but to get eleven months' time for payment, and also to get his brother John to guarantee it.* And, even then, he was unable to meet it at maturity, but paid it some time in the spring, probably from the clock company money.

Seventh. The judgment of Dr. Bowman (D. Exhibits, p. 51; D. Vol. 2, p. 851) shows, as we have already seen, that from the beginning of 1873 till he got the money from Fettrow in April, 1876, he was unable to pay his family physician for necessary medical attendance.

Eighth. The Wilson judgments (D. Exhibits, pp. 54, 52, 53) with their various executions, alias executions, stays of execution, returns unsatisfied, etc., show that from February, 1871, till after the April term of 1873 (and probably till he got the Hauck money in July, 1873), he was unable to meet a small debt of eighty odd dollars, and that the constable found no way of making the money from him.

Ninth. The judgment of Good in 1875 (D. Exhibits, p. 55) till he got the money from Fettrow on April 1, 1876, with its execution and return of "*Nulla bona*," in November, 1875, *shows his want of attachable property to the amount even of $29.94 in that period*, and his inability to meet even that small debt.

Tenth. The concurrent testimony of FREES and YETTER (D. Vol. 1, pp. 132–134 and 134–138) shows that the period of his extreme destitution commenced as early as September 17, 1869.

Eleventh. The concurrent testimony of a great number of witnesses, his neighbors, associates and intimates, shows that from 1869 to the summer of 1880 he was in extreme poverty. GOOD (D. Vol. 1, p. 506) lived at Milltown from the spring of 1867 to the fall of 1870—during that time Drawbaugh's means were very limited.

HIS WIFE (D. Add. Proofs, pp. 221–232, Ans. 20, 22 to 30) testifies that the family lived in extreme poverty from 1869 to 1880, hardly knowing from day to day where their bread was to be obtained, and dependent upon relatives for clothing.

MARQUART (D. Add. Proofs, p. 116, Ans. 26–33) shows that for several years prior to March, 1875, Drawbaugh was always complaining of poverty, and was too poor to take a policy of insurance, although he desired to do so. In March, 1875, Marquart gave up soliciting him, as it appeared a hopeless effort, and never went there afterwards.

ORRIS, ex-county treasurer (D. Add. Proofs, p. 124, Ans. 35), testifies that Drawbaugh, in July, 1873, told him he desired to get this invention patented, but was too poor to do it, unless he could get help.

WOODBURN, candidate for county treasurer, visited Drawbaugh's shop July 14, 1873, on political business (D. Add. Proofs, pp. 133–138), and Drawbaugh made the same statement to him that he did to Orris at about the same time.

EMRICK (D. Add. Proofs, pp. 130–132) accompanied Woodburn on said political trip, and corroborates the statements of the latter. (Ans. 25.)

STEPHENSON (D. Add. Proofs, p. 142, Ans. 2, 3) testifies to his always representing himself as poor.

LONGNECKER (D. Add. Proofs, p. 159, Ans. 4) testifies to a similar conversation with Drawbaugh before the Centennial.

SHANK (D. Vol. 1, pp. 30, 31), the township constable, testifies to Drawbaugh's poverty from 1869 to 1880; tells of the executions, tax bills, etc., that he had in his hands for collection from him, the inability of Drawbaugh to meet them, and the expedients resorted to by the constable to make his collections.

FREESE and **YETTER** (Id. pp. 132 to 138), above cited, testified to his poverty from September, 1869, to the spring of 1870.

ZACHARIAS (Id., p. 50) testifies that from 1870 till into 1874 Drawbaugh was "hard up for money."

CARL (Id., p. 159), a butcher, lived at Milltown from the spring of 1869 to the spring of 1873; had an account with Drawbaugh; "pay was always very slow;" "never got any amount from him at one time;" Drawbaugh "never had it—never had the money to pay it."

SCHERICH, an insurance agent (Id., pp. 180–181), testifies that Drawbaugh couldn't insure his house through a period of many years for the reason that he hadn't the money—"he was too poor, he couldn't afford it." (Ans. 48, 54.)

SHETTEL (above quoted) tertifies to his poverty from 1870 to 1879.

FETTROW (above cited) shows his extreme destitution from and after 1870.

J. B. DRAWBAUGH, his brother (above cited), testifies to his poverty from 1870 to 1880.

H. F. DRAWBAUGH, his brother (above cited), confirms the testimony of J. B. Drawbaugh.

HERTZLER (above cited) strongly confirms the same.

J. D. KAHNEY (Id., p. 204) testifies that during the years from 1872 to 1880 Drawbaugh "was poor." "He was so poor that the neighbors wouldn't trust him hardly for anything." (Ans. 45, 46, 55.)

C. EBERLY (D. Vol. 1, p. 117), an old neighbor who had known Drawbaugh for many years, when asked what Drawbaugh's pecuniary condition was down to the summer of 1880, answered: "I am not able to tell that; I think he has been poor all the time." (Ans. 37.)

SMYSER (Id. p. 78) testifies "that he was a poor man."

Baylor (Id. p. 153) testifies that from June, 1873, till late in 1876 or the spring of 1877 (Ans. 3, 17) Drawbaugh was very poor; common report in the neighborhood where he lived was "that he was very poor, and often did not have the necessaries;" the witness heard at the time, that Drawbaugh's family "*did not know in the evening where their breakfast was to come from the next morning.*" (Ans. 20–24.)

Leonard (D. Vol. 2, pp. 696, 697) testifies that from 1871 to 1876 (Ans. 1, 4, 6) Drawbaugh was always in his debt "for the support of his family," and could not pay because "he had not the money."

Snyder (D. Vol. 1, p. 515) testifies that in 1872, 3 or 4, he, at the time, "did not believe" Drawbaugh "had one dollar," and hence declined a business proposition from him."

Smith (Id. pp. 340, 341) knew Drawbaugh to be very poor from 1872 to 1878; Drawbaugh once during that time, asked witness for a loan of two dollars to pay some creditor, and witness declined to lend it—he was doubtful if he would ever get it back.

Condry (Id. p. 141–2) was a miller employed at Etter & Shanklin's gristmill, in the neighborhood of Milltown from September 9, 1875, till the date of his deposition; from the fall of 1875 till 1880, Drawbaugh's financial condition was poor; "people counted him slow pay. In fact one time I was ordered not to trust him at the mill—and I think that is bad enough—for flour or feed."

Brooks (Id. p. 44, Ans. 34) testifies to Drawbaugh's being "hard up."

Balsley (Id. pp. 194–5.) testifies to his poverty from 1870 to 1874

Bricker (Id. p. 511) testifies to his great poverty in 1870 or 1871.

Bates (Id. p. 420 *et seq.*) corroborates the same statement as applicable to the period extending from the summer of 1874 to the fall of 1877.

Herr (D. Vol. 2, p. 668, Ans. 11) corroborates the same as to the year 1870.

Wolf (Id. p. 675, Ans. 9) corroborates the same as to the year 1875, in February or March.

Fry (D. Vol. 1, p. 146, Ans. 38) states that he had dealings with Drawbaugh from 1875 to 1880, and the latter was always complaining during that period, "that he was scarce of money."

Springer (Id. p. 182, *et seq.*) lived at Milltown from April 1, 1876, to January 6 or 7, 1877, (Ans. 3) and (p. 186.) Drawbaugh was very poor at that time, not being able to pay witness' little bills, the highest of which was about eighty cents, as they became due. (Ans. 44, 45.) Drawbaugh said he was not making enough to meet his ends. (Ans. 50.)

E. Z. **Good**, (D. Vol. 1, p. 199) had to go to Drawbaugh's shop six or seven times in 1876 and 1877, to collect a little bill of five dollars, which the latter "hadn't the money" to pay.

Dellinger (Id. p. 443), a miller, testifies that from March 1, 1876, to March 1, 1881, he lived at Milltown, and during the years 1876 to 1879 inclusive, Drawbaugh was poor; "he always pleaded poverty to me when I asked him for money; I sometimes asked him for fifty cents, and he said he could not give me ten." (Ans. 48.)

Milner (D. S.—reb. p. 514, Ans. 12), and **Clifford**, (Id. p. 510, Ans. 14) confirm the story of Drawbaugh's poverty prior to the spring of 1876.

Kline (D. Vol. 1, p. 627, Ans. 9) corroborates the same fact with reference to the fall of 1877 and prior thereto.

Clendennin (Id., p. 523) testifies to the same fact from 1878 to 1880.

Hamacher (D. Vol. 1, p. 193) testifies to his poverty in 1879. Witness had hard work to collect school tuition from him, and had to get the money through a constable.

Chellis (Id. p. 525, Ans. 7) testifies that from the beginning of 1879 to the summer of 1880 Drawbaugh was "generally very poor and hard pressed for money."

Millard (D. Vol. 1, p. 331) testifies as follows:

> "Q. 73. What was your information about his financial condition from 1869 down to 1880?
>
> "A. As far as I knew, it was about all he could to make a living with his experimenting that he was doing, and scarcely could do that."

Hiler (D. Vol. 1, p. 383), testifies to his poverty in 1869.

Kopler (Id. p. 545), testifies to Drawbaugh's poverty and inability to pay his running expenses in 1873-4.

Geo. W. Drawbaugh (Id. p. 603, Ans. 61), testifies to his uncle's poverty from 1869 to 1880.

Jefferies (D.Vol. 2, p. 684, Ans. 32), testifies that "he "was a poor man and had hard times in getting along," from 1876 to 1880.

Twelfth. The fact of his subscription to the *Scientific American* lapsing in 1869 or 1870, and never afterwards being renewed for want of money (D. Vol. 2, pp. 1052, 1053, Ans. 1569-70), indicates very strikingly his want of means.

Thirteenth. The fact that, although an active inventor, he applied for no patents from the year 1867 till the time when the Clock Co. and Chellis acquired the clocks and new faucet, and furnished the money for patenting them in 1878 and 1879, is something inexplicable on any other theory than the want of means. (For list of all his patents, down to the year 1880, See D. Exhibits, pp. 82-97.)

This concurrent testimony, corroborated by the account books of persons who had dealings with him, by the records of judgments obtained against him, and executions returned unsatisfied, and by the other facts mentioned, is all further corroborated by a great mass of testimony which we shall not here cite, because it will be necessary to refer to it hereinafter, when we come to consider the reason why he did not patent his speaking telephone.

Yet Daniel Drawbaugh was a man of singular industry, an indefatigable worker; a man having no vices; a man who spent no money unnecessarily; a man of the highest honesty and truthfulness. There is no conflicting testimony on these points, but the witnesses, both for complainants and defendants, concur as to the fact.

ZACHARIAS (D. Vol. 1, p. 50, Ans. 37) says that:

> "As a citizen and neighbor he has always been respected."

SMYSER (Id. p. 79, Ans. 41) says:

> "I never heard his word doubted or his character either. He is a poor man."

ZETTER (Id. p. 137, Ans. 16) says:

> "Mr. Drawbaugh's character was a good character. He was industrious and perfectly honest, but poor. He would willingly pay every man he owed if he would have the means. Always perfectly sober; I don't know that I ever seen him drink a glass of whisky; chance times he would take a glass of beer, but not unless somebody bought it for him. Did not, to my recollection, spend a cent at my bar while I lived there."

Condry (Id. p. 142) testifies as follows:

"Q. 36. Do you know what his general reputation was in the community there for honesty, temperance and industry?

"A. Good; I never heard anything about his honesty or dishonesty; never knew him to be intemperate, he was always industrious; people counted him a genius; said he worked hard."

Daniel Balsley (Id., p. 195) testifies as follows:

"Q. 30. Do you know what is his general reputation in the community where he lives for truthfulness and honesty?

"A. I believe he is truthful and honest; that is his reputation in the community where I live and where he lives; I live four miles away from him."

J. C. Smith (Id. p. 342) testifies as follows:

"C. Q. 94. Why was Dan always hard up; did he drink, or was he lazy, or what was the matter?

"A. He spent the most of his time experimenting; that is the reason why, I thought, he was hard up; he was always sober and industrious."

D. H. Good (Id. p. 507) testifies:

"Q. 12. What was Drawbaugh's general reputation, in the community there, for honesty?

"A. Good."

Edward Nichols, one of the complainants' witnesses (C. Vol. 3, p. 860), testifies as follows:

"C. Q. 77. Do you regard Daniel Drawbaugh as a very fine man, conscientious and truthful?

"A. I do."

Isaac Lloyd, another of complainants' witnesses, after testifying that he had known Mr. Drawbaugh intimately for the past sixteen years, stated as follows (C. Vol. 2, p. 1273):

"C. Q. 70. As you consider yourself to have been intimately acquainted with Mr. Drawbaugh for the past sixteen years, please state whether or not you regard him as an upright, conscientious and truthful man?"

"A. As far as I know, I do; he has always acted honorably with me."

As to his industry the witnesses all concur. *Zetter*, *Coudry*, and *J. C. Smith* have already been cited on that point. *Orris* testifies (D. Vol. 1, p. 172) that Drawbaugh worked in his shop habitually till late into the night. *D. Balsley* states (Id. p. 195, Ans. 29): "He was a very industrious, sober, hard-working man from the time he was thirteen years old to the present time." *J. D. Kahney* states (Id. p. 205, Ans. 48) that he had often been at Drawbaugh's shop when the latter was working at night. *Shettel* (Id. p. 211, Ans. 51) testifies as to his working in the shop at different times, "as late as 2 o'clock in the morning." *Rencker* (Id. p. 240, Ans. 81) testifies: "He always appeared very busy when I was there." *Springer* (Id. p. 187, Ans. 53, 54, 55) assisted him at the shop, in 1876, "pretty much every evening," and at other times. *John C. Smith* (Id. p. 335) states that Drawbaugh worked in the shop on Sundays. *Fettrow* (Id. p. 352, Ans. 45, 117) testifies to his frequently working in the shop till 10 o'clock at night, and even later. *Holsinger* (Id. p. 364, Ans. 43, 44) worked with him at the shop many times till 10 or 11 o'clock at night, and sometimes till 1 o'clock in the morning. *Henry F. Drawbaugh* (Id. p. 404-5, Ans. 67) says he assisted him in the shop at various times till midnight.

Dellinger (Id. p. 442) testifies to his habitually working in the shop till nine, ten, eleven and even twelve o'clock at night. *Free* (Id. p. 487) testifies to his working in the shop on Sundays. *Oyster* (Id. p. 490) confirms the same fact. *Chellis* (Id. p. 526) testifies to Mrs.

Drawbaugh's complaints about her husband's working in the shop "most every night" till "twelve or one o'clock."

H. K. Drawbaugh (Id. p. 553, Ans. 29; p. 568, Ans. 137; p. 569, Ans. 145) testifies to his uncle's constant habit of working in the shop, and working till towards midnight, and sometimes till two o'clock in the morning. *Carns*, one of the complainant's witnesses, testifies (C. Vol. 1, p. 916) to Drawbaugh's habit of working at the shop in the evening in 1868 and 1869. *Hart*, another of their witnesses, states (C. Vol. 2, p. 1517, Ans. 36) that it was common report in the community that Drawbaugh was in the habit of working half the night in the shop.

Mrs. Drawbaugh (D. Add. Proofs, p. 224, Ans. 36) testifies that her husband was in the habit of working in his shop every night.

Stevenson (D. Add. Proofs, p. 147, Ans. 47 to 49) gives strong corroboration of his great industry.

We have, then, in Daniel Drawbaugh, by the universal testimony of his neighbors and acquaintances, a sober steady, industrious, honest and truthful man; an "enthusiast in physics," whose "hobby" was electricity; a thoroughly competent mechanic, and a man of great inventive genius. It would be hard to name a combination of qualities better adapted than these to fit him for his great work of inventing the electric speaking telephone; and it would be hard to name a man whose testimony as to what he produced, and what results he accomplished, should be received with greater confidence.

II.

DRAWBAUGH'S TELEPHONE INVENTIONS.

We are now prepared to take up the history of Mr. Drawbaugh's invention of the Electric Speaking Telephone. This history is contained, chiefly in defendant's case, volumes 1 and 2, and in defendant's Add. Proofs (pp. 1 to 311); although a large amount of additional evidence relating to it is to be found in defendant's surrebutting proofs, and strong corroboration even in complainant's evidence.

For purposes of convenience and clearness, we will divide the discussion into two parts, to wit:

First, the history of Drawbaugh's invention from its beginning to the date of Bell's application for his first patent, Feb. 14, 1876.

Secondly, the history of Drawbaugh's invention from Feb, 14, 1876, to the commencement of this suit.

Part I.—Prior to Feb. 14, 1876.

Mr. Drawbaugh conceived the possibility of transmitting speech electrically, over a telegraph wire, during the winter of 1859–60, or prior to that time, and stated such conception to Prof. Samuel B. Heiges, of Shippensburg, Pa., now principal of the State Normal School, while the latter was at that time delivering a course of lectures on Physics in the Cedar Run schoolhouse, near Milltown. Prof Heiges fixes the date by the fact that the lectures were delivered only while he taught school in that schoolhouse, and that he last taught there in the winter of 1859–60. (S. B. Heiges, D. S.–reb., pp. 95, 96, 97.) The date of Prof. S. B. Heiges' teaching in that schoolhouse is also fixed by his brother, George W. Heiges, of York, Pa., a witness for complainant, who succeeded Prof. S. B. Heiges as teacher in the Cedar Run school, and taught there in the winter of 1860–61. (G. W. Heiges, C. Vol. 2, p. 1089, Ans. 2; p. 1094, Ans. 19.) *Prof. S. B. Heiges* (D. S.–reb., p. 96) testifies as follows:

> "Q. 12. Do you remember having any conversations with Mr. Daniel Drawbaugh during those sessions, with regard to the subjects of electricity and magnetism?"
>
> "A. Yes, sir; *on several occasions* he spoke of a clock to be run by a magnetic current of the earth, *and of speaking through the telegraphic wire by electricity.*"
>
> "Q. 13. When he spoke of speaking through the telegraphic wire by electricity at that time, did he refer to it as something that had been done, or as something that he deemed to be possible, or as something he deemed impossible?"
>
> "A. I inferred from his conversation that *he thought it was something that could and would be accomplished.*"

Drawbaugh himself testifies with his characteristic candor, that he cannot remember the date when he began to study the subject, that it was "a great while ago." (Ans. 35 D. Vol. 2, p. 753.) He recollects talking to some medical students at Washington, D. C., about the transmission of sound, as long ago as January, 1861, which date is fixed by a receipt taken there from C. M. Alexander for a patent office fee. (Id., p. 752, Ans. 30–36), and states that at that time he had his mind employed upon the subject. (Ans. 33.) *Henry B. Eberly* (D. Vol. 1, p. 284, Ans. 13), testifies that, *some time between 1861 and 1864, during the war*, Drawbaugh, on one Sunday, in the mill office (Eberly's Gristmill), in presence of several persons including the witness, spoke of attaching an instrument to the office *by which he could hear all that was* *going on at the mill office without leaving his house.* He then lived in the house nearest to the mill, and the distance from the mill office to his house was about forty feet. (Id., Ans. 14.) Drawbaugh (Ans. 38, D. Vol. 2. p. 753), thinks that he had the idea in his mind at that time, or even prior to that. It will be particularly noticed that the witness, Eberly, moved away from Cumberland County to Williamsport, one hundred miles distant, on May 27, 1873, and has never been back to the county since that date. (Eberly, Ans. 3, 4, 8), and that Drawbaugh moved out of that house in April, 1868, and never lived in it again while this witness was in Cumberland county. N. M. Lory, a carriage-maker, testifies (D. Vol. 1, pp. 225-226), that, *in the fall of 1864*, Drawbaugh told him he was "*about making a machine to talk through a distance of about twenty miles*" (Ans. 3); that it was to work *something like a telegraph, but you would have to talk into it* (Ans. 6); he understood that Drawbaugh had invented it, and had the plans made, and was going to make the machine (Ans. 9); that Drawbaugh tried to explain it to him, but witness could not understand it (Ans. 5); that Drawbaugh made a rough sketch of it, which witness reproduces and explains to the best of his recollection, said sketch being filed as "Exhibit Lory," and printed on p. 135, D. Exhibits; and that the part of the sketch marked "D" was the part to be talked into, and *was something like a cup*, while the part marked "A" was hollow inside and the parts marked C C were wires. ***Witness was never in Drawbaugh's shop since the fall of 1864.*** (Ans. 25.) He fixes the date as the fall of 1864, by the fact that his business at the grist-mill that day was to see about fixing Christian Eberly's buggy wheel, which had been broken. It will be noticed that there are *two* wires shown in the sketch, indicating electric circuit wires, and that the distance, "about twenty miles" indicates the use of electricity. The resemblance of the transmitter to a "*cup*" will also be borne in mind. The exact date of this event is fixed by John B. Drawbaugh's testimony (D. Vol. 1, pp. 585–6, Ans. 79 to 85), who swears that he was doing a particular job of repairing on the grist-mill for Mr. Eberly, at the time when Eberly's buggy wheel was broken, and produces his book account showing that that work extended from September 5 to September 27, 1864. He further states that William Lory was living at Milltown at the time. Recurring once more to the surrebutting proofs.

SAMUEL H. BATES (D. S-reb., p. 380), testifies that Martin Tates died at Milltown on Sunday, October 21, 1866, from hydrophobia, and, the case exciting a great deal of interest, he, with others, went to see the sick man on that day. As the witness passed the grist-mill Drawbaugh passed by, going towards Tate's house, and at that moment witness heard one of a group of men who were standing in front of the mill say: "Look at Daniel "Drawbaugh; personally you wouldn't think there is "more in him than a block of wood, and the idea of a "man like he to try to invent a talking machine"; to which another of the group replied: "If he is successful "in getting it finished, he will be the richest man in the "valley." Mrs. Mary M. Baer also testifies (D. S-reb., p. 110), to hearing Drawbaugh's talking machine spoken of in 1866, before her daughter worked in Drawbaugh's family. Returning to the defendants' answering evidence. CHRISTIAN EBERLY (D. Vol. 1, pp. 113, 114, Ans. 3, 9, 10, 11, 12), states that before he moved to New Cumberland (which was in 1867), Drawbaugh told him that sound could be conveyed by electricity, and that he was experimenting on it. **James A. Smith**, the postmaster of New Cumberland, Pa., testified (D. Vol. 1, pp. 518–20) that he lived in Milltown from the 18th, or 19th of March, 1856, till late in the fall of 1867, when he moved away (Ans. 3, 4); and that *early in the spring of 1867* Drawbaugh came into witness' office, and a conversation ensued on the subject of the telegraph, which the witness states as follows: "Mr. Drawbaugh remarked that the telegraph would be yet superseded and *men would talk audibly, as face to face, at any distance* saying at the same time *that he was experimenting.* I asked him at the time if he thought so, when he remarked: '*I am confident of it.*' I don't remember of any other conversation until within three days of that time—it might have been the next day—in his shop, when he told me that he and his daughter—I forget her name, but he says Emmy—*had talked together, and that there was a floor and two partitions between them.* At this time he did not tell me by what means they had conversed, but it made the impression on my mind that it was by a wire, but he did not say that; I don't know what made the impression, but that was the impression on my mind—that it was a wire. The daughter to whom Mr. Drawbaugh referred is now dead; I do not remember her name, but it was his oldest daughter." (Ans. 7.) It will be remembered that Mr. Drawbaugh's daughter died on November 18, 1871. (D. Vol. 2, p. 750, Ans. 23.)

Drawbaugh himself testifies (Ans. 39, p. 753) that his first telephone apparatus employed a *teacup* as the body of the instrument (compare Lory's testimony and Exhibit Lory sketch,) and *thinks* that he had that machine before he took out his faucet patents of November 20, 1866, but *knows* that he made the instrument before he moved his shop to the old clover mill now occupied by him.*

The teacup transmitter disappeared long ago, but its construction and mode of operation are fully and clearly set forth by Mr. Drawbaugh (D. Vol. 2, pp. 756–765), where it is illustrated by a sketch on p. 756, (Exhitit D, Drawbaugh sketch No. 1) and the mode of its construction and use in a battery circuit is shown by another sketch on p. 764 (Exhibit D, Drawbaugh sketch No. 3). It was a "carbon telephone" transmitter, operating on precisely the same principle as the "Blake Transmitters," now in general use and claimed to be covered by the Bell patent. The body, A, was an old porcelain teacup; the diaphragm, B, was a membrane; the electrodes, D E, interposed in the circuit, G H, were of copper, and the upper one, E, was connected to the diaphragm by a wire, C, so as to vary the pressure upon the low conductor, F, through the action of the sound waves. The low conductor was of pulverized material, and a vast number of experiments were made with it to test the merits of different substances and mixtures for that purpose, but he considered carbon the best (see pp. 998–999, cross-examination). The current used with it was generated by a galvanic battery, and was a continuous current. (Ans. 70.) The instrument transmitted sound by electricity—"some words but feebly"—and so that different sounds could be distinguished from each other and vocal sounds from other sounds. (Ans. 72, 73.) The results were such as to encourage him to go on with his experiments. (Ans. 73.) It was a clear anticipation of the Bell patent of March 7, 1876, if the latter be held to cover the electric speaking telephone. (P. Benjamin, defendants' expert, D. Vol. 2, pp. 1206–7, Ans. 50.)

---

*It will be remembered that he moved his shop down to the old clover mill in 1867.

The *first* receiver used with this teacup transmitter, he is unable positively to state, but says (Ans. 74):

> "The time since then is so long that I have no vivid recollection of any particular one; *I had a number of crude apparatuses*, but can't exactly remember the shape of any of them, *I had membranes stretched over hoops—over a hoop—I remember that; and I had electro-magnets, and the arrangement was varied*; I don't remember exactly the arrangement."

Whatever the first receiving instrument was, it was in the same circuit with the transmitter (Ans. 75). The first receiver that he is able definitely to remember and describe, is that shown in his sketch on page 762, marked Exhibit D. Drawbaugh sketch No. 2. He thinks this was made before he moved his shop to the clover mill (Ans. 85), and that it was used with the teacup transmitter. (Ans. 85, 93). It consisted of a tin can, B, having its bottom and top removed and a membrane diaphragm C stretched across one end, which membrane was connected by a tense cord, D, to an armature F supported on a spring G and arranged close to the poles of an electro-magnet E in the electric circuit H (p. 762, and Ans. 90, p. 763), as shown in Exhibit D, Drawbaugh Sketch, No. 3, p. 764. This instrument was a true telephone receiver, containing all the essential elements and inventions claimed by complainants to be found in the instruments represented in Fig. 7, of Bell's patent of March 7, 1876. (P. Benjamin, D. Vol. 2, pp. 1207–8, Ans. 51.)

That Drawbaugh had telephone instruments of some kind and probably the very instruments above described, as early as the year 1867, appears conclusively from the evidence.

Mrs. JENNIE M. BROWN (D. S-reb., pp. 163–170), who went to live in his family as a domestic, in the fall of 1867 (Ans. 6), heard of it at least "a couple of years" before she lived there (Ans. 7). She lived in his family till April, 1868 (Ans. 6), and, during that time, from the fall of 1867 to April, 1868, heard it spoken of in his family (Ans. 9, 10) and ridiculed and opposed by his wife (Ans. 12, 18, 21). Drawbaugh at that time spoke of talking through the machine (Ans. 17, 30). The machine was common talk in the community (Ans. 24–27). The witness saw it, and *remembers that an old common stoneware teacup was a part of it* (Ans. 20, 21, 22). The witness was married July 7, 1868 (Ans. 2), and often heard it spoken of before her marriage (Ans. 15). Her dates are corroborated by her mother, Mrs. Darr (Id. p. 110), who heard her speak of the talking machine while she lived in Drawbaugh's family (Ans. 9); and, in substance, by her sister, Mrs. Margaret Brenneman (Id. pp. 103–109), who succeeded her as a domestic in Drawbaugh's family.

SAMUEL SNELL (D. S-reb., pp. 412–418), was at Drawbaugh's place in 1867 (Ans. 3) when his shop was in the house forty or sixty feet from the grist mill (Ans. 4, 5), and saw and listened at the talking machine (Ans. 3–9). Drawbaugh at that time had an experimental telephone line extending from his shop to the office of the grist mill (Ans. 4), and the witness heard "words" through the apparatus "pretty distinctly" (Ans. 8). Witness did not see the transmitter, which was in Drawbaugh's shop, but listened at the receiver in the grist mill office. He remembers that the receiver looked "like a small tin can with something like a bladder or drumhead over one end of it—tied on" (Ans. 9). He had heard of the machine before, and went and asked Mr. Drawbaugh to show it to him (Ans. 16, 17, 18, 19, 20.) Drawbaugh spoke of the apparatus as something not completed, but which he was working upon (Ans. 7). At that time Christian Eberly owned the grist mill (Ans. 15). Mr. Eberly sold the mill to George Leonard in January, 1871 (Leonard, D. Vol. 2, p. 696–7, Ans. 3). The witness has never been in Milltown to stop since the day when he saw that talking machine there in 1867 (Ans. 22, 23, 24).

James Davis, (D. S-reb. pp. 418–421) was at Drawbaugh's shop in the fall of 1867, after harvest (Ans. 12, 16), Drawbaugh's shop was in the clover mill (Ans. 15). The witness then saw the talking machine in the shop (Ans. 22, 23). He had heard of it before he went down to the shop (Ans. 18–22.) Drawbaugh said he was "working on it" (Ans. 22).

George B. Eyster, sheriff of Cumberland county (D. S-reb. pp. 890, 819), was at Drawbaugh's shop when it was "right back of the grist mill at Eberly's Mills," and before it was moved to the old clover-mill, in company with George B. Heck, who died in July, 1873 (see Barber, Id. pp. 372–3; Natcher, Id. p. 150; John B. Heck, Id. p. 892), and looked at some of Drawbaugh's inventions. As they left the shop Heck told him they had not seen all—that he was working at one which he didn't show to everybody, a talking machine (Ans. 4, 5). William Natcher testifies (D. S-reb. p. 150, Ans. 8) that he heard George B. Heck speak of it in 1871 or 1872.

Henry Killmore, (Id. pp. 1124–1128) was at Drawbaugh's shop with Michael S. Drawbaugh in 1867, when it was "right back of the grist mill," (Ans. 5, 6, 7, 8), and then saw the talking machine there (Id). He was there again in June, 1868, but then the shop had been moved to the old clover mill (Ans. 11, 12, 13). When he saw the talking machine in 1867, Drawbaugh told him he was working at it (Ans. 17); that it was to talk from one point to another (Ans. 19), and that he thought it would be a success (Ans. 15). He had no recollection of ever meeting Drawbaugh between June, 1868, and a time subsequent to the commencement of this suit, when he met him at Bridgeport (Ans. 37–42). *Michael S. Drawbaugh died on March 16, 1871* (Ans. 20, 21). The date of Michael S. Drawbaugh's death is confirmed by Jacob H. Kilmore (Id., p. 1040, Ans. 23), George D. Millard (Id., p. 1098, Ans. 6–10), and Adam Drawbaugh (Id., p. 1100, Ans. 5, 6, 7), Jacob H. Kilmore, George D. Millard and Adam Drawbaugh all heard Michael S. Drawbaugh, in his lifetime, speak of Daniel Drawbaugh's talking machine (Id., p. 1039, Ans. 17; p. 1100, Ans. 4; p. 1097, Ans. 1–4).

JACOB A. GRAHAM (Id., pp. 1057–1069) testifies (Ans. 11–13) that, in 1867, Daniel Drawbaugh's brother, Henry F. Drawbaugh, at Newville, thirty miles away from Eberly's Mills, told him of Daniel's talking machine, and said it would take the place of telegraphy. Witness was then an internal revenue inspector at Newville, in Andrew Johnson's administration, and Henry F. Drawbaugh had charge of the bonded warehouse at Wheeler's distillery (Ans. 1 to 21).

GEORGE MURPHY, of Newville (Id., pp. 1063–1066), ran the engine at Ahl & Snyder's distillery, near Newville, from November 22, 1866, till June 1, 1867, and, during that time, in April, 1867, Henry F. Drawbaugh came to the distillery on some business, and while there, told him of Daniel's talking machine, and stated that it would take the place of telegraphing after awhile.

JOHN S. DOUGHERTY, a merchant at Newville, (Id., pp. 1131–1134) heard Henry F. Drawbaugh, in February or March, 1867, speak of Daniel's talking machine, and heard others speak of it about the same time. In May, 1868, witness went to Daniel Drawbaugh's shop at Eberly's Mills, to see the talking machine, but could not get admittance in consequence of Mr. Drawbaugh's absence at the time.

WILLIAM DARR, one of the complainants' rebutting witnesses (C. Vol. 1, pp. 358-366), was forced on cross-examination, into a striking corroboration of the main fact above referred to. He was called by the complainants to prove, among other things, that, although he had lived at Milltown for twenty years prior to March 31, 1870, when he moved away, and had known Drawbaugh well during that time, he had never seen or heard of his talking machine (p. 359). But he had, at one time while he lived there, gotten off a great joke upon Mr. Drawbaugh, and was very vain of its paternity; and upon this rock his testimony-in-chief went to pieces. We will let him give the story in his own words:

"C. Q. 85. I have heard that you once got off a very good joke on Drawbaugh while you lived there. He was telling you that he had a machine with which he could talk across the Atlantic ocean, and you replied that he had better limit his operations to Yellow Breeches Creek before he tried the Atlantic Ocean?

"A. That is so; that is what I told him.

"C. Q. 86. Your words, as I have heard them repeated, were about as follows: 'Dan, you had better try the Yellow Breeches before you try the Atlantic Ocean.' Is that substantially the reply you made to him?

"A. Yes, sir; that is about it. He said the time was coming when they could talk across the sea. I said, 'O! take the Yellow Breeches first.'

"C. Q. 87. How long was that before you moved away from Eberly's Mills?

"A. I don't know whether I can study that up or not. I know it was a couple of years before I moved over here.

"C. Q. 88. Do you mean to say it was just two years before, or might it have been more than two years?

"A. About two years before I moved over here.

"C. Q. 89. Where was that conversation, in what building or place?

"A. In the shop next to Eberly's Mill. One was called the upper shop, and the other the lower shop. It was in the upper shop.

"C. Q. 90. How happened the conversation to start on the subject of talking across the sea?

"A. I hardly mind that—exactly how it happened. I don't think much was said, He was tired and leaning against the bench and said: 'Bill, do you believe the time is coming when we can talk across the sea?' I said: 'Oh, you had better try the Yellow Breeches first.' I said too: 'What is the matter with you, Dan, are you going crazy?' I don't think there was much more than that said, before or after.

"C. Q. 91. Didn't he say, also, that he was going to do it, or had a machine that would do it?

"A. No, sir; he said nothing of the kind.

"C. Q. 92. He dropped the conversation after your reply to him, did he?

"A. Yes, sir."

In the last three answers above quoted, the witness evidently tries to tone down the testimony found in his answers 85, 86. He changes the statement of Drawbaugh from the positive form of answer 86, "*He said the time was coming* when they could talk across the sea," to the interrogative form, "*But do you believe the time is coming* when we can talk across the sea?" and states that Drawbaagh did not say he was going to do it, or was working on a machine for the purpose: whereas, his own alleged reply to Drawbaugh, "*You* had better try the Yellow Breeches first," shows that such was undoubtedly the tenor of the conversation. This conversation, he says, was about two years before witness moved away from Milltown. (Ans. 87, 88.) His wife, however, who was called as a witness for the defendants, in surrebuttal, remembers the joke (which seems to have been an unusual event in the family), and states the fact as follows (D. S-reb. p. 110):

> "Q. 10. Did you ever hear your husband, Mr. William Darr, while you lived at Milltown, say anything about Mr. Drawbaugh's talking to a distance, or mention the subject of talking to a distance?
>
> A. Yes, sir.
>
> Q. 11. Do you remember what your husband said about it at that time?
>
> A. Yes, sir.
>
> Q. 12. Will you state what it was, as you remember it?
>
> A. He came in one day and *said to me that Mr. Drawbaugh was speaking of making a telephone, or some sort of a talking machine; that he could talk across the ocean with to other parts of the world.* I don't remember just how he spoke it.
>
> Q. 13. Did he tell you what he said to Mr. Drawbaugh? If so, what was that, do you remember it?
>
> A. He told him, '*that he had better invent something* to talk across the Yellow Breeches first.'
>
> Q. 14. Was that conversation while your daughter, Jennie, lived with Mr. Drawbaugh, or before, or after?
>
> A. Before.
>
> Q. 15. Can you tell us when that conversation was?
>
> A. *In 1866.*"

The facts and the date are undoubtedly as Mrs. Darr states. Her husband's admission, after his testimony on page 359 (C. Vol. 1), is a striking illustration of the utter worthlessness of "negative evidence."

It therefore clearly appears, from the above, that Drawbaugh conceived the idea of transmitting speech by electricity over a telegraphic wire, prior to the spring of 1860; that during the rebellion he was studying upon the subject and had formed some crude plan of its mechanism as early as September, 1864; that prior to the beginning of 1868, he had been able to transmit and receive some words quite distinctly through it; that, at that early time, he was intending it, when completed, to transmit speech many miles—to take the place of telegraphing—and even hoped it might be used for conversing across the ocean; and that his efforts were known and talked about, not only in the community at Milltown, but in parts of the adjoining county of York, and at Newville, thirty miles away. What that *something* then devised for the purpose of transmitting speech electrically was, we are informed by his own testimony above cited, which testimony on that point is corroborated by Lory, Mrs. Brown, and Snell. It further appears, by an examination of the sketches of the machines (D. Vol. 2, pages 756, 762, 764), and by the testimony of defendants' expert, as well as by the conclusive fact that the machines audibly transmitted and reproduced some words, that the apparatus anticipated the fifth claim of Bell's patent of March 7, 1876, as the complainants now construe that claim.

We may pause here to refer to some of the preliminary investigations and experiments by which Mr. Drawbaugh was led up to a true conception of the essential characteristics of the speaking telephone at that early date, during the seven years that intervened between his conversations with Professor Heiges in 1859–60 and his achievement of the transmission and reproduction of words in 1867.

"A great while ago," while he was yet a young man attending singing-school, he was instructed in some of the fundamental characteristics of sound, including the fact that *pitch* is due to the *rate* of air vibrations per second. (Drawbaugh, Ans. 80, 81, page 761.) He had also experimented with the vocal organs by placing his hand upon the throat and feeling the vibrations of the vocal cords and in that simple manner learned that the vibrations were unbroken and continuous in a spoken word or syllable. (Ans. 79.) The fact that sound has the effect to set up vibrations in solid substances, he had first learned by noticing such effect in the surface of a partition (Ans. 76); and he had experimentally demonstrated that such vibrations were capable of producing considerable mechanical effects (Ans. 78); and that if a door, vibrated by sound, were connected by a light wooden bar to another door, this second door would give off the same sound. (Id.) He had, as early as December, 1863, known of the Scott phonautograph, in which the sound waves, acting upon a stretched membrane, are caused, by means of a lever style attached to the membrane, to trace their own peculiar characteristics upon a paper or card. He, therefore, knew at that early time that a continuous electric current must be used, and not a make-and-break current, and hence, that the electric current must be modified or varied, but not broken, by the sound waves. Hence, in all his telephones, from the first to the last, he used a closed circuit, and arranged the diaphragm-armature close to the poles of the electro-magnet, but not so as to touch them. (Ans. 199, 200, p. 784.) He never made a make-or-break instrument until within the last year prior to his testifying in the case. (Ans. 383, 384, p. 824.) He never made nor owned a string telephone or "lovers' telegraph." (Ans. 380, 381, p. 824.) His discovery and application of a low conducting material, in pulverulent form, to modify the necessarily continuous electric current, were arrived at by a process of pure scientific reasoning. He conceived the idea that when they were in a pulverized condition the air spaces between the particles would offer more or less resistance to the passage of the current, and that if by pressure these particles were brought nearer together, more of their surfaces would be in actual contact with each other, and hence the current would pass more freely through the mass; and therefore, as the result of this reasoning, he connected the pulverized low conductor to the diaphragm so that the movements of the latter, under the influence of the sound waves, would vary the pressure upon the pulverized mass and thus vary the current passing through the line in proportion to the magnitude of the sound waves. (Ans. 148 to 153, pp. 772-3.) This theory was entirely original with himself, and he demonstrated its correctness by experiment (Ans. 152), and by testing it with a galvanometer. (Ans. 65-67, p. 759.) Mr. Drawbaugh's speaking telephone was, therefore, no happy accident. It was the result of a train of seven years' investigation, reasoning and experimentation, carried forward on as logical and scientific a plan as can be found in the whole history of the arts. The accidental vibration of a partition led him to the speaking telephone as logically as the falling of an apple led Newton to the theory of gravitation.

Exhibits F and B.

The next step in the development of Mr. Drawbaugh's speaking telephone, consisted in the production of a transmitter and receiver, constructed upon the same general plan as the old teacup and tin can instruments, but with important improvements. Of these two instruments, nearly all the essential parts remain in existence and are filed in evidence as defendants' Exhibits F and B, the former being the transmitter and the latter the receiver. These extant parts are illustrated in defendants' book of drawings, pp. 2 and 7. For the purposes of this case, the instruments were reproduced and the reproductions filed in evidence as Exhibits Reproduced B and Reproduced F. Drawings of the reproduced instruments appear in said book of drawings, pp. 3 and 8; and the instruments and drawings are fully described in Drawbaugh's testimony, pp. 764 to 774; 868, 869, 872, etc.; Knight, D. Vol. 2, pp. 714-6; Park, Benjamin, Id., pp. 1179-1183, Ans. 29; the latter witness testifying that the instruments completely anticipate the fifth claim of Bell's patent of March 7, 1876, as construed by the complainants.

By examining these instruments, it will be seen that they grew naturally out of the old teacup and tin can instruments illustrated by Drawbaugh's sketches on pp. 756, 762, D. Vol. 2. In the transmitter, F, a glass tumbler superseded the porcelain teacup; the diaphragm was covered over by a wooden cap provided with a mouth-orifice; the low conducting material was placed in a suspended box; an arrangement for adjusting the normal pressure upon the low conductor was provided; and the instrument was lined with plaster-of-paris to deaden the vibrations of its walls. At first, membrane diaphragms were used in this instrument; at other times thin metal, generally tinned iron, known as commercial "tin." (Drawbaugh, Ans. 128, p. 768; Ans. 1270, p. 997; Ans. 1667, p. 1065.) In its companion-instrument the receiver B, Drawbaugh had discovered the superflousness of the string D and spring G shown in the sketch of his earlier form of receiver on page 762, and had discarded them, bringing the diaphragm of the tin-can up closer to the electro-magnet and attaching the armature directly to the diaphragm, thus rendering the instrument quite compact in form and arrangement. The tin tube was lined with plaster of paris (Ans. 108, 109, p. 766); and a metal bracket or spring, G, was employed for giving tension to the membrane. (Ans. 101.) In the old tea-cup instrument he had tested, as a low conductor, "different materials at different times," such as "clean, fine earth," earth combined with plumbago, plumbago alone at times, pulverized charcoal, finely divided metals combined with plumbago, and, perhaps, the same in combination with earth; the experiments being so various that all the combinations could not be recalled to memory (Id., Ans. 61, 62; X 1280 to X 1310); but in tumbler instrument he got beyond the use of earth, and settled upon the use of carbons, or carbons mixed with bronze-powder (Id., Ans. 131; X 1283), although he made numerous experiments to ascertain the best conditions under which the various substances or mixtures could be employed. (Id., p. 1037, etc.) He used a number of different tops or mouth-pieces with the tumbler, F. (Ans. 1289.) At first the box containing the low conductor was suspended by a single rod; afterwards by a U-shaped rod or stirrup, as shown in Exhibit reproduced F. (Ans. 1288, 1289.) In the earliest form of the F instrument he tried the effect of moistening the low conductor by the evaporation of water contained in the lower part of the tumbler. (Ans. 134, 135; X 1294), and found that with earth and its combinations a certain degree of moisture was the best, while the carbons operated best when dry. (Ans. 1294.) The tumbler with the bottom broken off, now filed as an exhibit in this case, was used at an early period, and is mentioned by various witnesses as having been seen by them from time to time in all the years from 1869 to the present date.

These two instruments, Exhibits F and B, came into existence some time in 1867 or early in 1868.

They were seen at Drawbaugh's shop, by *Henry B. Eberly* about the time when he moved with his parents to New Cumberland, which was in the spring of 1867. (Eberly, D. Vol. 1, pp. 284, 286, Ans. 31, 9, 7). He never was at Milltown after May 27, 1873 (Ans. 8, 11). The tumbler instrument was seen by *Mrs. Brown* when she lived in Drawbaugh's family, from the fall of 1867 to April 1868 (Mrs. Brown, D. S-reb. pp. 163-170, Ans. 6, 20-23). *Hoffman* (D. Vol. 1, pp. 481-485) was working for the old Pump & Faucet Co. in the spring or summer of 1868 (Ans. 3), and saw at that time the tumbler instrument, and Drawbaugh making a wooden top and fitting it on (Ans. 5-8). Drawbaugh at the time said it was a talking machine. (Ans. 5.) *Schrader*, now a resident of New Jersey, and agent of the Judson Powder Co. (D. S-reb., pp. 467-471) worked for the old Pump and Faucet Company from November 20, 1868, to April 8, 1869, (Ans. 2, 3, 6) and boarded with Daniel Drawbaugh during that time. His time is fixed by the books of the company, and also by the fact that Maggie Darr (Mrs. Brenneman, D. S-reb, p. 103) was living in the family as a domestic. While he was working there at that time. Mr. Drawbaugh on several occasions took him up to his private room over the machine shop, and showed him a machine which he called a talking machine (Ans. 12) and which, Drawbaugh stated to him, was "for the purpose of talking between distant points, as, for example between Eberly's Mills and Harrisburg, which, I think, he used as an illustration. He also made the remark that it might be used to take the place of the telegraph." (Ans. 13.) Witness identifies Exhibit B as a machine which he saw there at that time, and states that it had an iron or steel armature fastened across the membrane diaphragm, and that the bobbins on the electro-magnet, which are now dilapidated by age, were perfect at that time (Ans. 14, 15, 16, 17). He also remembers seeing some wooden mouth-pieces at the same time lying on Mr. Drawbaugh's table and resembling the mouth-piece of exhibit F. (Ans. 15.) In the family while he boarded there the talking machine was spoken of at the table on several occasions, when Mr. Drawbaugh "spoke about it in the same spirit and in the same way that he talked to me up in the shop—that it would take the place of telegraphing, and that you could talk between distant points." (Ans. 18.) *Snell* (D. S-reb, p. 413), already above cited, saw the tin can with the membrane diaphragm as early as 1867.

Christian Eberly (D. Vol. 1 pp. 113–121), the father of Henry B. Eberly above cited, moved from Milltown to New Cumberland on April 1, 1867 (Ans. 3, 6), and from New Cumberland to Shiremanstown on December 22, 1870 (Ans. 7). About the time that he moved to New Cumberland, or shortly after (Ans. 13), but positively before he moved to Shiremanstown (Ans. 14), he saw the two machines, Exhibits B and F, at Drawbaugh's shop (Ans. 15). Drawbaugh told him at the time that they were to convey sound by electricity, were to convey spoken sounds, and would answer the same as telegraphing (Ans. 16, 17).

A. B. Shank (D. Vol. 1, pp. 21–41), saw the machines, F and B, in 1869 and prior to February 3, 1870 (Ans. 73–80), and talked through them with Mr. Drawbaugh at his shop (pp. 22, 23). The machines were in different rooms, and connected by two wrapped wires. Witness heard and understood, through the instrument, the words that were spoken into the transmitter, and could distinguish the voice through the instrument as the voice of Drawbaugh and not of some other person. (Id. same pages also Ans. 198–201, p. 40; Ans. 153–155, p. 36). The tin box was of a green color; the bottom—diaphragm—was not torn out as now; and the wire on the electro-magnet was not loosened up as now. (Ans. 117–119). The tumbler was lined with something white, and had some water or liquid in it. (Ans. 58–62.) The diaphragm was transparent (Ans. 65). The tumbler was whole at that time (Ans. 64).

JOHN J. ZACHARIAS, a miller, (D. Vol. 1, pp. 46–60), was, from the fall of 1868, to the spring of 1875,* head miller at the New Cumberland Mills, and, having occasion to face and level off some mill-stones, went to Drawbaugh's shop at Milltown to get a tram for that purpose. While there, on that errand, he saw and talked through the machines B and F (pp. 47–49). Joseph B. Stretch, a millwright, was at work at the same mills at that time, and, by means of his time-book, fixes the date of Zacharias' procuring the tram as before June 18 and July 3, 1869 (Stretch, *Id.* pp. 60–62). When Drawbaugh talked through the machines to Zacharias, on that occasion, the machines were on different floors in the shop (Ans. 16, 17), and Drawbaugh was upstairs while witness was on the floor below (*Id.*). Witness heard and understood, through the machine, what Drawbaugh was saying (Ans. 18), and distinctly understood and recognized the tones of Drawbaugh's voice (Ans. 19). The voice sounded as though he was speaking in an undertone (Ans. 65). Witness' ear was close to the receiver (Ans. 66); he heard no other sound excepting the sound heard through the machine (Ans. 69). The machine was a rude machine (Ans. 71), and the two instruments were connected together by something like wrapped wires, which passed from instrument B out through the partition and upstairs to the instrument F (Ans. 22). The end of the tin can next to the electro-magnet was covered by something fastened on by threads like those now appearing at the end of the can (Ans. 24-27). Drawbaugh said, at the time, that he "could run it "out for miles, and parties could talk in at one end, and be "heard at the other end, the same as persons in a room "together" (Ans. 28), and that it would eventually take the place of telegraphs" (Ans. 29).

---

* NOTE.—For the correct dates, see D. Add. Proofs, Hake's deposition, pp. 107 to 113.

HENRY YETTER (D. Vol. 1, pp. 135-138), lived at Milltown from April 3, 1869, to March, 1870, not quite a year, keeping a tavern and carrying on butchery. While living there, one day in haymaking or harvest (1869) he was in Drawbaugh's shop and Drawbaugh told him he was making a talking machine; showed him instruments B and F (Ans. 27), and told him it was operated by electricity (Ans. 21).

GEORGE FREESE (D. Vol. 1, p. 132) was at Drawbaugh's shop to collect some money, $2.50, while Yetter kept the tavern at Milltown, and Drawbaugh went and borrowed the money from Yetter and paid it to witness. At that visit, witness saw instrument B (Ans. 6), and Drawbaugh talked through the machine to him, and the witness with his ear close to the machine, heard through it distinctly. (Ans. 9-11.) He had heard of Drawbaugh's talking machine six months previously, but that was the first time he ever saw it (Ans. 12). Henry Yetter's ledger (Yetter, Id. pp. 135-136; Ans. 29) shows the loan of the $2.50 to Drawbaugh on September 17, 1869.

JOHN SCHERICH (D. Vol. 1, pp. 176-182) saw and talked through instruments B and F about 1869, several years before witness moved to Camp Hill, on April 1, 1873 (pp. 176-7). Drawbaugh went into the basement to talk, and witness remained in the third story of the shop to listen. and heard what was said. (Ans. 7.) Drawbaugh said it was a talking machine, and was better and handier than the telegraph, as you could just talk through it in place of writing. (Ans, 7, 9.) Witness could distinguish the voice through the machine as Drawbaugh's voice (Ans. 12).

ISAAC B. MILLARD (D. Vol. 1, p. 324) was married on November 11, 1869 (Ans. 5), and before his marriage saw and talked through the talking machine at Drawbaugh's shop (pp. 325-327), and heard and understood what was said through it (Ans. 22). He identifies the instrument B as the one he listened at (Ans. 14, 19, 23), and which was in the second-story of the shop at the time (Ans. 19, 23). The transmitter was not in the shop, but out on the bank fifty yards away (Ans. 21, 24, 25), and some person, whom he does not remember, was talking into it at the time (Ans. 21, 27).

ABRAHAM FISHER (D. Vol. 2, pp. 688, 689) was at Drawbaugh's shop about 1868 or 1869, within about a year after Mr. Hursh went into the faucet business there (Ans. 2-12), and saw instruments B and F. (Ans. 10.) Drawbaugh said he was going to bring it to perfection, and was making good progress with it (Ans. 7) and that it was a machine to talk through—he said he could talk through it some distance—from one house to another in town, or from one part of a house to another, he could convey sound. (Ans. 8.) This must have been in 1868, as Hursh was one of the original six who started the faucet business, in May, 1867. (Gorgas, D. Vol. 1, p. 657; Ans. 49.)

David B. Carl (D. Vol. 1. pp. 157–165) was at the shop just after the old faucet company had suspended operations and before they sold out to the Haucks, and saw the instruments F. and B. His visit was in the year 1870 (Ans. 5, 6, 22, 24, 64, 67), while he lived at Milltown and before he moved away in the spring of 1873. (Ans. 4, 5, 3.) The instruments were in different rooms on the same floor (Ans. 31, 32, 33, 34), and were connected by a wrapped wire. (Ans. 10.) Drawbaugh said they were talking machines (Ans. 11); that one was to speak into and the other was to listen at (Ans. 12); that a person could hear at one end what was spoken at the other end (Ans. 13), and that you could hear and understand from New Cumberland to Harrisburg, a distance of about three miles (Ans. 14). The tumbler had plaster-of-paris inside of it, and the end of the tin can next to the electro-magnet was closed (Ans. 59). There was a tube or funnel at the other end of the tin can (Id). This tube and funnel is described and illustrated by Daniel Drawbaugh (D. Vol. 2, p. 868, Ans. 638–641).

Jacob S. Shopp (D. Vol. 1, pp. 387–392) was at Drawbaugh's shop immediately after September 14, 1869 (Ans. 5, 6), to have some work done on a harvester knife which witness and Henry Bonholtzer had patented on that date, and then and there saw the instruments B. and F. (Ans. 16.) Bonholtzer was present at the time.

Drawbaugh told them he was working at a machine by which to convey the voice (Ans. 9) and showed them these instruments.

HENRY BONHOLTZER (Id. pp. 384-387) corroborates the visit, the date and the talking machine.

So many witnesses saw these two instruments, F. and B., at Drawbaugh's shop in 1870, 1871, 1872, 1873, 1874 and 1875, down to February 14, 1876, the date of Bell's application for his patent, that it is utterly impracticable, within the limits of a brief, to give an abstract of their several depositions, but a mere reference must suffice.

Referring to D. Vol. 1:

SAMUEL NICHOLS (p. 228) saw and talked through them in 1869, and heard and understood what was said.

H. GEISTWEIT (p. 458) saw and talked through them in July, 1870, or 1871, and heard and understood what was said.

H. K. DRAWBAUGH (p. 550) saw and talked through them early in 1870.

J. B. DRAWBAUGH (p. 580) saw them in 1869, and knows of their being talked through that year (Ans. 37-40).

G. W. DRAWBAUGH (p. 597), saw them in 1870 or 1871, while painting Jacob M. Sadler's wagon. The date of that job is corroborated by John F. Lee (Id. p. 607); Daniel Drawbaugh (Vol. 2, p. 777); and complainants' witnesses, William Sadler (C. Vol. 1, p. 1039), and Henry Neidig (C. Vol. 2, pp. 1521-31.)

JOHN H. STEPHEN (p. 249), saw them at some time between the beginning of 1870 and 1875. The date is fixed by Henry Otstot (D. S.-reb. p. 361) as in either 1870 or 1871. He was at the shop with Stephen and saw them at the same time. Otstot was never in the shop after 1873 (pp. 360, 361 D. S. reb.)

P. C. Zimmerman (pp. 414–5), saw them in February or March, 1871, and never saw them again till about the beginning of this suit. He describes them very clearly and says Drawbaugh at the time told him that they worked by electricity and could be heard a great distance.

L. C. Steinberger (p. 344), saw them and C. and I, while he lived at Milltown between February, 1871 and October, 1871, and never was in Drawbaugh's shop after that latter date. Harmon Drawbaugh showed them to him in the shop, and said at the time that they had talked through them and could talk from the shop up to the grist mill.

Elias Z. Good (p. 198), saw them in 1872, before he moved away from Milltown on April 1, 1872.

Jacob Hawn (p. 267), saw them while he resided at Middletown, prior to May 27, 1872, when he moved from that place.

John C. Smith (pp. 335–6), among other talking machines saw and talked through F. and B. frequently while employed on the Pennsylvania R. R. on Locomotive No. 502, from April 1, 1872, to April 1, 1873. He fixes the time by his time book. He helped Drawbaugh experiment on the machines, and testifies that he heard and understood through them. He describes the instruments, their condition at that time, and the experiments made with them.

Henry F. Drawbaugh (pp. 396–7), among other talking machines, saw and talked through F. and B. in August, 1872, and could hear and understand what was said through them. He recollects and repeats the words "Harrisburg is the capital of the state, situated on the "banks of the Susquehanna river," which he then heard through them. He fixes the date by work he was doing at the shop, of which he has a book account.

MICHAEL P. SMYSER (pp. 75–6), saw and talked through them not later than 1872, and repeats words which were heard through them: "Don't you want to be a Christian "while you're young?" and counting, "one, two, three, "four, five!" He describes the machines, and that they were operated by electricity. The talking was from one story of the shop to another, with the stairway door closed. He fixes the date by the fact that he was, at the time, arranging for some business, in case he should lose his position at the arsenal, and was at Drawbaugh's shop with reference to that prospective business. He afterwards lost his position at the arsenal, on June 30, 1873. (Diven, D., Vol. 1, p. 74.)

JACOB E. SHETTEL (p. 206), saw them and C about 1872. He describes them with great particularity. (Ans. 4.) The instrument F then had a metal diaphragm. (Ans. 6.)

RUFUS K. SHIREMAN (p. 259), saw them about 1872. About four months afterward he saw them again, and talked through them, and could distinctly hear and understand what was said through them, being able also to recognize through them the voice of the speaker.

I. D. KAHNEY (p. 201) saw and talked through them about 1872, from one floor to another of the shop, and heard and understood distinctly what was said through them.

WILLIAM SENSEMAN (p. 640), among other talking machines, saw and talked through F and B while he lived at Milltown from April, 1872, to April, 1873, and could hear and understand some of the words. One instrument was in the basement, and the other was two floors above. One of the instruments talked through may have been C or I.

Jeremiah Kohler (pp. 544–5), saw them in 1873, and at that time talked through the talking machine. He could hear and understand what was said through it. Drawbaugh told him it was operated by electricity. One of the instruments talked through may have been C or A, which he saw there at the same time.

Dr. John W. Moffit, of Harrisburg (p. 495–6), saw and talked through them in 1873, and remembers hearing the words, "Do you hear me talk," through them. One of the instruments talked through may have been C, which he saw here at the same time. Drawbaugh explained the principle of the machines.

Henry N. Shoop (p. 256) saw instrument F in August, 1873, when H. K. Drawbaugh explained to him that it was Daniel Drawbaugh's talking machine, and was operated by electricity.

Ephraim R. Holsinger (p. 361) moved to Milltown before the middle of September, 1873, and moved away November 27, 1876, since which time he has never been in the town. While there he saw and talked through instruments B and F, and heard and understood what was said through them. He saw the instruments A, D and E, while Mr. Drawbaugh was making them, but saw B and F before he saw A, D and E—which fixes the date of his seeing B and F as not later than 1873. He helped Mr. Drawbaugh experiment a great deal with speaking telephones while he lived at Milltown. He was recalled by the complainants in rebuttal and asked if he had any corrections to make in this deposition, to which he replied that he had one only, viz., to correct the date of his moving to Milltown from September 7, 1873, to September 13, 1873.

HENRY BAYLER, of York, Pa. (p. 151), saw and talked through the talking machine at Drawbaugh's shop in June, 1873. He identifies B and a tumbler instrument as instruments which he saw there at the time.

JAMES BROOKS, millwright (p. 41), worked in the grist-mill at Milltown from December 16, 1873, to March 31, 1874, and during that time saw and talked through instruments B and F, one of the instruments being in the basement of the shop and the other two floors above, connected by two wrapped wires. He heard and understood what was said through them. Drawbaugh told him they were operated by electricity.

GEORGE L. HALE (p. 473) saw them and O in the fall of 1873.

DANIEL BALSLEY (p. 192) saw them while the old sawmill was still standing in a dilapidated condition. The mill was torn down and hauled away about September 1, 1874, by Amos Frownfelter. (Frownfelter, Id., p. 661.)

HENRY B. MUSSER (p. 315) saw and talked through them on June 27, 1874, and fixes the date by a book-entry of the job of work which he went to Drawbaugh's shop that day to get done. The machines were in different rooms, and connected by wire. Drawbaugh told him they operated by electricity, and explained to him about low and high conductors.

DANIEL RUPP (p. 427) saw the instrument F and other talking machines in June or July, 1874.

WILLIAM H. BATES (p. 419) saw them and C in the fall of 1874, and Drawbaugh told him they were for talking instead of telegraphing, and that they operated by electricity.

John M. Waggoner (p. 122) saw them and A in November, 1874.

Michael Konn (p. 129) happened to be in Drawbaugh's shop at the same time and confirms the date and the fact of Drawbaugh's showing Waggoner the talking machine and explaining that it operated by electricity.

John Weber (p. 245) saw them and A in the latter part of December, 1874. He was never at Drawbaugh's shop after January, 1875.

Joseph M. Wisler (p. 393) saw instrument B prior to moving away from New Market, in the spring of 1874.

Jacob E. Smith (p. 166) was married March 26, 1871, and while on his wedding trip was at Drawbaugh's shop and saw instrument B.

Daniel C. Jones (p. 504) lived at Milltown one year, from the spring of 1870 to the spring of 1871; has never been in Drawbaugh's shop since; while living at Milltown saw instrument B.

Daniel B. Musser (p. 607) saw instrument B in 1873, before his wife died. She died January 24, 1874.

Urias R. Nichols (p. 90) saw A and B and listened at B, as a receiver, in January, 1875.

Capt. J. A. Moore (p. 613) saw B and others in May, 1875. (Ans. 20–32, pp. 622–623.)

Jonathan Balsley (p. 110) saw F. and others in October or November, 1875. (Ans. 33.) He fixes the date by the death of his wife at that time.

Daniel B. Condry (p. 139) saw B, F, and others on Christmas day, 1875.

Daniel Fettrow (p. 347) saw them and others when the Axle Company were getting their new machinery into the shop, which was in March, 1875.

Jeremiah Fry (p. 144) saw them and others on or about April 9, 1875.

Jacob H. Renecker (p. 233) saw them and others on or about the beginning of May, 1875.

William Eppley (p. 281) was never at Drawbaugh's shop since May or June, 1875, but saw B and F there, or something similar to them, and possibly A, at or prior to that date.

George Free (p. 484) saw them and others on or about June 21, 1875. The date is fixed by

John A. Oyster (p. 490), who was there with Free and saw the same machines. Drawbaugh talked through the talking machine to them that day.

John F. Rupp (p. 311) saw F and A on February 1, 1876. The precise date is fixed by Hamacher (p. 289), Strong (p. 375), and the entry of the visit on Strong's school report, D. Exhibits, pp. 14-15, lower left-hand corner of p. 15.

Referring to Vol. 2, of defendants' evidence:

Henry Herr (p. 669) saw B, or something very like it, and also a "glass part," at Drawbaugh's shop about 1869-1871. Drawbaugh told him it was a talking machine, and, he thinks, talked to him through it.

N. N. Hubler (p. 691) saw B, F, and others, in January, 1874.

Dr. C. E. Updegraff (p. 1081) saw B, F, and others, in April, 1873.

John Wolfe (pp. 775-6) saw B and others in March, 1873.

John Henry Smith (p. 1094), who was there with Dr. Updegraff, in April, 1873, saw B there at that time.

Thomas Updegrove (p. 1090), who was there with Dr. Updegraff in the spring of 1874, saw B and others there at that time.

Referring to defendants' surrebutting evidence:

JESSE EICHOLZ (p. 160) saw F, B, and others, in 1871, and talked through them. Possibly C or I was used in talking. Heard and understood distinctly. Had heard about the talking machine before he ever saw it (Ans. 6).

GEORGE HOSLER (p. 367) lived at Milltown from March 5, 1872, to March 25, 1873, and never has been in Drawbaugh's shop since he moved away. While living there he saw F, C, and possibly B and I.

JACOB R. VANNASDALE (p. 788) was at Drawbaugh's shop on February 2 or 3, 1875, with Jacob F. Ensminger, and while there saw F, B and others. He was never there after that date. The date is fixed by a book entry, and also by the fact that it was immediately after the explosion of Wilson's store (see Ensminger's testimony). Wilson's store exploded on January 19, 1875, and Wilson himself afterwards died, about November 1, 1875 (see Holsinger, C. Vol. 2, p. 1215; also Complainants' Exhibit, pp. 401, 402, and Holsinger, D. Vol. 1, p. 373 (Ans. 114).

JACOB F. ENSMINGER (p. 808) corroborates the date and the facts testified to by Vanasdale, but is unable to identify all the talking machines seen at the time.

ANDREW EVANS (p, 1) was in Drawbaugh's shop about December 1, 1875, among other talking machines saw B.

MARY A. EVANS (p. 61) was there with Andrew Evans about December 1, 1875, and among other talking machines saw B.

WILLIAM H. ZEARING (p. 122) was there while Jacob Karns was working there for the old faucet and pump company, from August 10, 1868, to February 4, 1871, and saw B.

In Add. Proofs, pages 185 to 196 is the testimony of a very important additional witness, EMANUEL K. GREGORY, who was formerly a resident of Milltown, Pennsylvania, but moved away to Taunton, Massachusetts, in December, 1870, *and was never in the State of Pennsylvania from December 5, 1870* (see his testimony, corroborated by that of his son Joseph, just preceding his in the printed record), *till the day before he testified in the Overland case, March 6, 1885.* He testifies positively to assisting Drawbaugh frequently in his telephone experiments in 1870, to talking and hearing through the machines, and to the electrical character of the instruments; and he identifies Exhibits F and B as the instruments which they were then using (pp. 191, 192; Ans. 46-48).

This completes the list of witnesses—seventy-four in all—who identify Exhibits B and F as in existence prior to February 14, 1876; and, of these, more than sixty identify them as in existence prior to Bell's first experiment of June 2, 1875; more than forty identify them as in existence prior to the month of July, 1874, the date of Bell's alleged conception of the *impracticability* of getting audible results by the vibration of an armature in front of an electro-magnet; and twenty testify that they talked through the machines and heard and understood words and sentences through them prior to June 2, 1875. The instruments F and B were unquestionably experimental and crude and incapable of producing the *best* results, *but they talked,* and thereby demonstrated that Drawbaugh had solved the problem of transmitting articulate speech by electricity.

Exhibits C and I.

Next in order after these instruments came two companion magneto-telephone instruments, C and I. (Drawbaugh D. Vol. 2, pp. 775, Ans. 166, and 787, Ans. 233.) Of these two instruments, C was the first, and was made, in its original form, about the latter part of 1869 or early part of 1870. He was experimenting with it when Jacob M. Sadler's wagon was repaired about 1870 or 1871. (Ans. 169-171), and it was then in a condition to transmit sound (Ans. 174), and was, to the best of his recollection, in the form now shown in Exhibit Reproduced C. Drawing (p. 5, Defendants' book of drawings.) (Ans. 186, 781.) At first, it was made for use as a receiver, and contained two membrane-diaphragms, connected together, inside of the case, by a tense cord; with an electro-magnet, but no permanent magnet. Afterwards, he took off the heel-piece of the electro-magnet, and, by placing a permanent magnet against the cores of the electro-magnet, found that the instrument could be used as a transmitter. After that, he concluded to discard the extra diaphragm, and to that end, sawed off the middle portion of the case and removed it, took out the diaphragms, inserted a German silver diaphragm with an armature attached to its centre, and put the pieces of the case together again. It was now a complete magneto-telephone, capable of being used as a transmitter and also as a receiver (Ans. 183-184); and was in all material respects, the same as the instruments patented in Mr. Bell's patent of January 31, 1877. (P. Benjamin, pp. 1183-6, Ans. 30.) It was used for the purposes of a receiver, as a substitute for the old tin can receiver B, with the tumbler instrument as a transmitter, (Drawbaugh, Ans. 180), in a

In Add. Proofs, pages 185 to 196 is the testimony of a very important additional witness, EMANUEL K. GREGORY, who was formerly a resident of Milltown, Pennsylvania, but moved away to Taunton, Massachusetts, in December, 1870, *and was never in the State of Pennsylvania from December 5, 1870* (see his testimony, corroborated by that of his son Joseph, just preceding his in the printed record), *till the day before he testified in the Overland case, March 6, 1885.* He testifies positively to assisting Drawbaugh frequently in his telephone experiments in 1870, to talking and hearing through the machines, and to the electrical character of the instruments; and he identifies Exhibits F and B as the instruments which they were then using (pp. 191, 192; Ans. 46-48).

This completes the list of witnesses—seventy-four in all—who identify Exhibits B and F as in existence prior to February 14, 1876; and, of these, more than sixty identify them as in existence prior to Bell's first experiment of June 2, 1875; more than forty identify them as in existence prior to the month of July, 1874, the date of Bell's alleged conception of the *impracticability* of getting audible results by the vibration of an armature in front of an electro-magnet; and twenty testify that they talked through the machines and heard and understood words and sentences through them prior to June 2, 1875. The instruments F and B were unquestionably experimental and crude and incapable of producing the *best* results, *but they talked,* and thereby demonstrated that Drawbaugh had solved the problem of transmitting articulate speech by electricity.

EXHIBITS C AND I.

Next in order after these instruments came two companion magneto-telephone instruments, C and I. (Drawbaugh D. Vol. 2, pp. 775, Ans. 166, and 787, Ans. 233.) Of these two instruments, C was the first, and was made, in its original form, about the latter part of 1869 or early part of 1870. He was experimenting with it when Jacob M. Sadler's wagon was repaired about 1870 or 1871. (Ans. 169–171), and it was then in a condition to transmit sound (Ans. 174), and was, to the best of his recollection, in the form now shown in Exhibit Reproduced C. Drawing (p. 5, Defendants' book of drawings.) (Ans. 186, 781.) At first, it was made for use as a receiver, and contained two membrane-diaphragms, connected together, inside of the case, by a tense cord; with an electro-magnet, but no permanent magnet. Afterwards, he took off the heel-piece of the electro-magnet, and, by placing a permanent magnet against the cores of the electro-magnet, found that the instrument could be used as a transmitter. After that, he concluded to discard the extra diaphragm, and to that end, sawed off the middle portion of the case and removed it, took out the diaphragms, inserted a German silver diaphragm with an armature attached to its centre, and put the pieces of the case together again. It was now a complete magneto-telephone, capable of being used as a transmitter and also as a receiver (Ans. 183–184); and was in all material respects, the same as the instruments patented in Mr. Bell's patent of January 31, 1877. (P. Benjamin, pp. 1183–6, Ans. 30.) It was used for the purposes of a receiver, as a substitute for the old tin can receiver B, with the tumbler instrument as a transmitter, (Drawbaugh, Ans. 180), in a closed circuit (Ans. 187), and with better results than any former receiver (Ans. 188). Whole sentences were heard through it as thus used (Ans. 189, 190, 191, 192), before the date of repairing Mr. Sadler's wagon (Ans. 192.) But after the permanent magnet was applied to it, it was used more often for transmitting than for receiving purposes. (Ans. 191.) The horse-shoe magnet was not attached permanently, but was generally placed on the machine with its poles against the heel of the electro-magnet, when the machine was in use.

This entire instrument, with the exception of the magnets, is still in existence, and is filed as Exhibit C in this case (Ans. 181). A reproduction of it has been made and also filed as an exhibit. The extant parts of the original instruments are illustrated in defendants' book of drawings, p. 4, and the reproduced instrument is shown on p. 5. The instruments are clearly described in the testimony of Drawbaugh. (D. Vol. 2 pp. 779–81, 783–5; and P. Benjamin, Ans. 50, 51, 52.)

The instrument, I, was made after C, and was designed as a receiver, to be used with C as a transmitter. (Ans. 194,195.) It was first made about 1871, in the form represented in the left-hand figures on p. 13 of defendants' book of drawings—that is to say, without a permanent magnet—and was, when in that shape, used only as a receiver (Ans. 201); but soon afterwards (Ans. 197, 209) it was modified by placing a compound permanent magnet at the heel of the electro-magnet as shown in the right-hand figures on p. 13 of defendants' book of drawings, and in that form was used both as a receiver and also as a transmitter. (Drawbaugh, Ans. 194, 195, 198, 207, 208, 209.) These changes were made before the Haucks purchased the faucet company's business in July, 1873. (Ans. 210.) These two instruments, C and I, when used together gave results that were much more satisfactory, louder and entirely better, than the results achieved with B and F. (Ans. 202, 203.) They were thoroughly tested in a great variety of ways (Ans. 206), and transmitted and reproduced articulate speech (Ans. 202). The cover or mouth-piece of I was at first considerably arched, as shown on p. 13 (drawings), but afterwards a lower cover was made which reduced the air-space above the diaphragm, and gave better results (Ans. 211, 213, 214). The original wooden case of this instrument is in evidence, with both the arched and the flat covers (Ans. 196, 212), and also the original magnets (Ans. 216, 786–7) and diaphragm. At first the wooden cover was lined with plaster-of-paris, but this was discontinued when the flat cover was made, because found to be of no utility (Ans. 218). At first the metal diaphragm of I was made with holes in it (Ans. 219), but the holes proving of no utility, an imperforate metal diaphragm was substituted. At first the thin metal diaphragm of C was not corrugated, but soon after was corrugated to give it greater stability and rigidity (Ans. 221), which was found beneficial (Ans. 222). *The old tea-cup instrument of 1866 was the first battery transmitter invented by Drawbaugh, and the instrument C of about 1870, was his first magneto transmitter* (Ans. 204, 785). With the two magneto instruments, C and I, as he used them prior to the sale of the faucet business to the Haucks, in July, 1873, *Mr. Drawbaugh had a magneto electric telephone line completely equipped and in all respects anticipating both Mr. Bell's patents here in suit.* (P. Benjamin, Ans. 30.)

These instruments are identified, and their successful use for transmitting and reproducing speech prior to February 14, 1876, proved, by many witnesses besides Mr. Drawbaugh—so many, indeed, that it is impracticable here to give more than a brief reference to their testimony.

CHARLES LEVI STERNBERGER (D. Vol. 1, pp. 344–6) resided at Milltown from February 1, 1871, to October, 1871 (Ans. 3), *and has never been in Drawbaugh's shop since he moved away.* (Ans. 4.) While he lived there, he was in said shop (Ans. 5) and saw instruments F, B, C and I. (Ans. 7, 25–26.) He never again saw the instruments C and I until the day when he gave his deposition and C not till he was actually on the witness stand. (Ans. 27, 28.) *Just before he went on the stand, Mr. Jacobs showed him, at his (Jacob's) office, some of Mr. Drawbaugh's old talking machines but not including I, and Mr. Steinberger told him there was no more, and asked to see it, and described it so clearly that Mr. Drawbaugh had no difficulty in understanding which one he meant and immediately going and getting it for him.* (Ans., 29, 30, 31.)

Both instruments were therefore in existence prior to October, 1871. Indeed

JACOB S. SHOPP (Id., pp. 387–92), saw instrument C soon after he patented his reaper-knife in September, 1869, and probably in the fall of 1869 or early in the year 1870. (Ans. 16, 17.)

HENRY OTSTOT (D. S-reb. pp. 360–364) *was never in Drawbaugh's shop but twice* (Ans. 2), the first time being in 1870 or 1871 (Ans. 10, 11) *and the last time being on the day of the public sale of the effects of George B. Heck, deceased.* (Ans. 3–9.) *George B. Heck died on July 9, 1873, and his sale was on September 13, 1873,* *as shown by the papers of his brother and administrator* (John B. Heck, D. S-reb. pp. 892–3). Otstot saw talking machines on his first visit to Drawbaugh's shop, but does not remember seeing any on his last visit. (Ans. 12, 24.) He identifies instrument C as seen by him there on his first visit. (Ans. 25.)

William Senseman (D. Vol. 1, pp. 640-2) lived at Milltown from April 1, 1872 to April 1, 1873 (Ans. 1, 2) and *has never been inside of Drawbaugh's shop since.* (Ans. 4.) While living at Milltown, he was frequently in said shop, and saw and talked through the talking machines there. He identifies instruments C and I as being among the machines which he saw there or like machines which he saw there (Ans. 11, 20), and says he remembers no others, except F, B, C and I, but remembers these very well. (Ans. 15.)

George Hosler (D. S-reb. 367-371) lived at Milltown from March 5, 1872 to March 25, 1873 (Ans. 2), and *has never been in Drawbaugh's shop since.* (Ans. 10.) He identifies instrument C as one which he saw there—"that or something that looked like it"—and says he remembers it well. (Ans. 11.) Drawbaugh's talking machines were common talk in the community while witness lived at Milltown. (Ans. 15).

Professor Samuel B. Heiges (D. S-reb. pp. 95-103) was at Drawbaugh's shop twice in the months of June or July, in his summer vacations, during the different summers between 1871 and 1874 (Ans. 14, 15), but on his first visit did not see Mr. Drawbaugh. (Ans. 17.) *He never saw Mr. Drawbaugh in his shop but once, and that was between the first day of June, 1871, and the first day of August.* (Ans. 18.) At that visit, witness' brother-in-law, Dr. Mosser, *was living at Shiremanstown* and went to Drawbaugh's shop with him. Dr. Mosser moved away from Shiremanstown to Mechanicsburg on April 1, 1874 (Ans. 20; also see test'y of Dr. Bruckart, who bought out Dr. Mosser's property and practice at Shiremanstown, D. S-reb. pp. 1129-1130). Prof. Heiges' visit was therefore prior to the year 1874. It was also prior to the sale to the Haucks on July 1, 1873, and witness heard nothing said about any contemplated sale, although his brothers-in-law, Dr. Mosser and Henry S. Rupp, were both members of the faucet company, and he was at the time on a visit to their home at Shiremanstown. (Ans. 28, 29.) It is therefore certain that Prof. Heiges' visit to Drawbaugh's shop was prior to July 1, 1883, and probably was in the year 1872, or possibly in 1871. At that visit Dr. Mosser had some business to transact with Drawbaugh, and after he was through with that business, a five minutes' conversation took place between witness and Drawbaugh relative to the talking machines. (Ans. 21, 35.) He then and there saw instrument C and took it in his hand and pressed the diaphragm with his finger in order to vibrate it. (Ans. 34, 36.) *The diaphragm was of metal at that time.* Mr. Drawbaugh told him at the time, that the machine operated both by magnetism and electricity (Ans. 39), *and that the voice produced pulsations* (Ans. 38); and also told him that he (Drawbaugh) and others had talked through the machine (Ans. 32), and that it had operated so that the talk could be heard through it. (Ans. 33.) *After the speaking telephone came into public use, and before witness had any knowledge of this suit, he was in the habit of instructing his classes to the effect that he had seen a speaking telephone long prior at Mr. Drawbaugh's shop* (Ans. 46, 47, 48), and mentioned the fact even in public lectures. (Ans. 46.)

JESSE EICHOLZ (D. S.-reb. pp. 152-158; recalled, pp. 160-162) was at Drawbaugh's shop on November 6, 1873, which time is fixed by his books. (Ans., 7-13.) He then saw the tumbler instrument F, and the instrument C, or one similar to it, but having a horse-shoe magnet attached to it. (p. 162; Ans., 17, 18.) He thinks he also saw I, or something like it. (Ans., 17.) He heard and understood distinctly what was said through the machine (p. 153, Ans., 15, 16), although he was in the cellar, and the speaker was two stories above him (p. 156, Ans., 35.) He heard and understood at first with the mill stopped, and then, to test the question, had the water-wheel started, and found he could hear and understand while it was running. (Ans., 44, p. 157.) His wife was with him. (p. 153, Ans. 11.)

MALINDA ANN EICHOLZ (Id., pp. 158-160), who was with her husband, Jesse Eicholz, on November 6, 1873, and *was never at Drawbaugh's shop since* (Ans., 11), corroborates her husband's account of that visit, and of the talking through the talking machines, in every particular. She had also heard about Drawbaugh's talking machine before her husband went down to see it in 1870 or 1871. (p. 159.)

GEORGE B. EYSTER, sheriff of Cumberland county, also corroborates the Eicholz testimony. He was Mr. Eicholz's co-partner, and was told of the visit at the time. (D. S.-reb., pp. 890-1.)

JACOB E. SHETTLE (D. Vol. 1, p. 209, Ans., 34) saw instrument C in 1872, when he first saw B and F. (See Ans., 7, 8, 9, 10.)

WILLIAM H. ZEARING, secretary of the school board of the township (D. S-reb., pp. 122-135) got Drawbaugh to repair some steelyards in the fall of 1873, and went down to the shop to get them on November 25, 1873, which date is fixed by the entry of the payment in his account books—" 1873, November 25. For relettering " steelyards, per D. Drawbaugh, 35." (Ans. 16.) While there that day to get the steelyards, Drawbaugh talked to him through the machines, Drawbaugh being downstairs and witness two floors above. (Ans, 33-36.) Witness heard and understood through the machine what was said, and remembers some of the words that he heard through the machine, including the words, " The steelyards are finished " (Ans. 37), and the month, day and year. (Ans. 69.) The instrument I looks like the one he saw on that occasion. (Ans. 42.) He heard others talk through the machine at the time (Ans. 54), and heard it all as distinctly as he did the words above quoted. (Ans. 57.) It is evident from his testimony that he did not see the transmitter which was used by Mr. Drawbaugh downstairs, and that I was used as the receiver.

E. B. Hoffman (D. Vol. 1, pp. 481-4; recalled, Id. p. 660) saw I in August, 1873, at the time of the great flood. (Ans. 13, 9.) He saw C before that time. (Ans. 13.) He first heard Drawbaugh talk through the talking machine in the fall of 1871, and understood what was said. At that time (fall of 1871) Drawbaugh asked him through the machine, what he, witness, thought of the machine, witness at the time being downstairs and Drawbaugh above. Witness himself spoke through the machines in October, 1874. In his depositions on pp. 483, 660 he describes the machine C as he saw it prior to August, 1873, specifying the large horse-shoe permanent magnet as a part of it (Ans. 14, p. 483), and the electro-magnet. (Ans. 2, p. 660.)

Complainants made a desperate effort, in rebuttal, to break Hoffman's date of August, 1873, but utterly failed. (*See appendix B of this brief, where such effort and its results are fully discussed.*)

HARMAN K. DRAWBAGH (D. Vol. 1, p. 552) saw C a long while ago (Ans. 18), and he thinks (Ans. 19) that it was before he worked at Waynesboro, which would fix the date as prior to the spring of 1872. (Ans. 14.) When he first saw C it had the electro-magnet as now shown in Exhibit C reproduced (Ans. 22, 23), although he does not remember the permanent magnet.

HENRY HERR (D. Vol. 2, pp. 667-73) *was never at Drawbaugh's shop, so far as he can remember, after the axle company began operations* (spring of 1875) (Ans. 3), but, while there prior to that time, saw instrument C and remembers that it then had a permanent horse-shoe magnet on it (Ans. 16, 17), and looked older than the reproduced instrument C now looks. (Ans. 17.)

HENRY F. DRAWBAUGH (D. Vol. 1, pp. 396-413) saw C and I shortly after he had the apple cylinder made in Daniel's shop in August, 1872. (Ans. 76, 77.)

HENRY BAYLER (Id. pp. 150-7) thinks he saw C at his visit to the shop in June, 1873. (Ans. 31.) *Witness has never been into the shop since the summer of* 1873. (Ans. 16.)

JEREMIAH KOHLER (Id. pp. 543-7) saw C at the shop in 1873. (Ans. 3.) He also heard and understood talk through instruments there during that year. (Ans. 10, 8, 1.)

GEORGE L. HALE (Id. pp. 472-7; recalled, p. 665) saw C in the fall of 1873. (Ans. 7.) It had a horse-shoe magnet on it at that time. (Ans. 11.) He describes said magnet and its position. (Ans. 12, 13, 14.) And it had copper wires connected with it. (Ans. 18.) It also had something like spools having copper wires covered with green, heavier, he thinks than the wires of Exhibit reproduced C (Ans. 2, p. 665), which spool was arranged between the diaphragm and the permanent magnet. (Id. Ans. 3, p. 665-6.) The instrument was like Exhibit reproduced C. (Id. Ans. 1.)

DR. J. W. MOFFIT (D. Vol. 1, pp. 494-506) saw C in 1873. (Ans. 5, 12.) He repeats a sentence that he heard through the machine about that time. (Ans. 13.)

J. B. DRAWBAUGH (D. Vol. 1, pp. 575-96) saw C and I and thinks it was before he went to work for the Haucks, on July 19, 1873, but is not entirely positive as to the date. (Ans. 32-36; Ans. 11.) He talked through some of the machines in the latter part of 1872 or beginning of 1873 (Ans. 26, 27), and the listener heard and understood what was said (Ans. 28, 29); and he remembers and repeats sentences that were then transmitted and understood through them. (Ans. 29.)

M. P. SMYSER (Id., p. 77) saw them both, but is unable to fix the date. (Ans. 28.)

A. B. SHANK (Id. pp. 19-41) saw instrument A about the time when the Axle Company came into operation (December 23, 1874 to April 1, 1875; Ans. 53), and saw C before he saw A. (Ans. 82.) He saw I after he saw C. (Ans. 132.) He thinks that the year 1874 was about the last time that he saw the talking machines. (Ans. 135.)

G. W. DRAWBAUGH (Id. pp. 597-605) saw C, or a machine like it, in 1874, and both used it and witnessed its use by others. (Ans. 46, 47.)

WASHINGTON SUTTON (D. Vol. 2, pp. 1103-1108) saw C about August, 1873. (Ans. 16; 1, 2, 3, 4.) He remembers the permanent magnet on it, the brass on top of the electro-magnet, the mouthpiece or case (Ans. 16), the battery (Ans. 17), the wires hanging loose (Ans. 17, 18, 20), and that Drawbaugh told him it was operated by electricity. (Ans. 21.) He has forgotten whether he heard through it or not (Ans. 19), but remembers that Drawbaugh talked through the machine. (Ans. 10.) His nephew,

RANKIN B. SUTTON (Id. pp. 1108–1109), however, testifies that when Washington Sutton returned home from Drawbaugh's shop, in August, 1873 (Ans. 5), he told of the visit and the talking machines, and said he had heard Mr. Drawbaugh speak through them. (Ans. 10, 11.) Washington Sutton's errand to Drawbaugh's shop was to buy a lathe (W. Sutton, Ans. 7), but when he got there he found that the lathe had been sold to Hauck. (Ans. 8.) This fixes the visit as immediately after the sale of the machinery to the Haucks in July, 1873, and confirms the date, August, 1873, as fixed by the recollection of both witnesses.

Washington Sutton was never at Drawbaugh's shop after that visit. (W. Sutton, Ans. 1.)

N. N. HUBLER (Id., pp. 691–2) saw C and I in January, 1874, while teaching school at Milltown. C then had a magnet upon it. (Ans. 4, 5, 6.)

WILLIAM F. LENIG (Id., pp. 698–9) saw C in January or February, 1874, while Hubler was teaching school at Milltown. Hubler was at Mr. Drawbaugh's shop with him. (Ans. 1, 6.) C then had a horse-shoe magnet upon it. (Ans. 6.)

DR. C. E. UPDEGRAFF (Id., pp. 1081–1093) saw C and I at his first visit to the shop in May, 1874, when Updegrove was there with him. (Ans. 1, 2, 24, 25.) It then had a magnet on it. (Ans. 25.)

THOMAS UPDEGROVE (Id., pp. 1098–1101) *was never at Drawbaugh's shop except on the occasion of his visit there with Dr. Updegraff, in May*, 1874. (Ans. 2, 3, 6.) At that time he saw C and I (Ans. 9), and C had on it an electro-magnet (Ans. 10) and a permanent magnet. (Ans. 9, 12.)

JOHN SCHERICH (D. Vol. 1, pp. 176–82) identifies I as looking like the machine which Drawbaugh talked into at the shop in the fall of 1874 (Ans. 13–28), when witness heard and understood what was said through the line, from the basement to the third floor. (p. 178.) He has no recollection of ever being there after that visit. (Ans. 16.)

RUFUS K. SHIREMAN (Id., pp. 259–266) first saw talking machines at Drawbaugh's shop about eight years ago (Ans. 7), and, a few months afterwards saw others, including I, there. (Ans. 69.) He feels pretty positive that he saw I at his first visit. (Ans. 72.) Drawbaugh spoke to him through the machines at his second visit (Ans.16-23), and he heard and understood the words. (Ans. 27–29.)

WILLIAM J. MAGLAUGHLIN (D. S-reb. pp. 750–763) was at Drawbaugh's shop with E. B. Hoffman (see D, Vol. 1, pp. 481–4) in August, 1873, and saw I. (Ans. 26.) Drawbaugh talked to Hoffman and to witness through the machines, from second to the first floor (Ans. 22–25). and *witness answered back through the machines.* (Ans. 23–25.)

This talking back and forth indicates the use of the two magnetic machines, C and I, at that time. Witness remembers the instrument, I, at which he talked, and listened, but cannot identify the instrument at which Drawbaugh talked and listened; but Hoffman (D. Vol. 1, p. 483) identifies both instruments.

David Spangler, Jr. (D. S-reb. pp. 454–462), lived on the Studebaker farm for two years ending March 1, 1875 (Ans. 3, 6, 10), and was then at Drawbaugh's shop once, in the fall of 1874 (Ans. 28, 29), when he saw instrument I. (Ans. 30.)

Daniel Rupp (D. Vol. 1, pp. 427–39) was at the shop in 1874 (Ans. 9, 10, 12, 15), and saw C (Ans. 15) and other talking machines. Drawbaugh talked through the machines from room to room, and he heard and understood through them what was said, and remembers that the names of some of the Pennsylvania cities were heard through the machines (p. 430). Wrapped copper wires were employed to connect the machines. (Ans. 32.) Drawbaugh said the machine was to take the place of the telegraph. (Ans. 34.)

Thomas Draper, a prominent business man of Dover, Delaware (D. Vol. 2, pp. 1,123–35), *was at Drawbaugh's shop once only in his life, and that was in the summer or fall of* 1874 (Ans. 1–11), for the purpose of ordering a hydraulic ram for his tenant, Kissinger, who lived on his Marysville farm. He then saw and talked through instruments C and I (Ans. 26, 27), and distinctly heard and understood what was said through them. *The defendants did not know of his information about the talking machines till after the complainants had interviewed him first and gotten the facts* (pp. 1,130–2). Witness remembers the entire details of the visit to Drawbaugh's shop with great distinctness. *Until he was informed by the attorney of the Bell Telephone Company, a few days before we put him on the witness stand, he had always supposed that the speaking telephones in use over the country were Drawbaugh's machines, and that the name "Bell" was derived from some capitalist who had put money into the company.* (Ans. 36.)

His deposition is conclusive of the whole case, and the complainants, realizing this fact, made a desperate effort to shake the date of his visit, but unsuccessfully. For a thorough analysis of the evidence attacking and supporting his date, see *Appendix A*, at the end of this brief.

WILLIAM H. BATES (D. Vol. 1, pp. 419-26) was at Drawbaugh's shop and saw talking machines there, including C, in the fall of 1874. (Ans. 9, 10.) He recollects that Exhibit C instrument then had something on it which is now gone (Ans. 10), and that that something was at the place where the magnets of Exhibit reproduced C now are (Ans. 55), but does not remember what it was.

JOHN WEBER (Id. 244-48) was at the shop in the latter end of December, 1874, *and has never been there since January*, 1875. (Ans. 4, 21, 22.) When there he saw, among other instruments, Exhibit C (Ans. 13), and was told that it was to talk in (Ans. 14).

JACOB R. VANNASDALE (D. S-reb. pp. 788-798) was at the shop on February 2 and 3, 1875, and saw instrument C among other talking machines (Ans. 28). He remembers that it had a permanent magnet "right up "against the spools." (Ans. 31.) *Witness was never in the shop after February* 3, 1875. (Ans. 18.) His date is fixed by his books, and is corroborated by Ensminger, (Id. p. 808) who was there with him at the time.

JOAN WOLF (D. Vol. 2, pp. 673-78) was at the shop, hauling the new machinery for the Axle Company, in March, 1875, and, among other talking machines, saw C. (Ans. 22.) He took it in his hand and remembers that the permanent magnet was lying on the bench at the time. His date is fixed by his book entries of the hauling. (Ans. 3-6.)

JEREMIAH FRY (D. Vol. 1, pp. 143-50) was at the shop about April 9, 1875 (Ans. 7), and saw C there. (Ans. 28, 29.) He saw I afterwards, but does not fix the time. (Ans. 30.)

JOHN H. SMITH (D. Vol. 2, pp. 1093-98) was at the shop with Dr. Updegraff and Mr. Boyle in May, 1865, *and never has been there since.* (Ans. 3, 12.) He then saw C and I (Ans. 4, 5, 10, 11) and remembers that C had the permanent magnet and the spools (Electro-magnet). (Ans. 9, 10,11.)

JACOB H. RENEKER (D. Vol. 1, pp. 233-44) thinks he saw C at the shop in May, 1875. (Ans. 4, 10.)

ANDREW EVANS (D. S—reb. pp. 1-37) saw C at the shop about December 1, 1875. (Ans. 63.) His date is thoroughly established by a large amount of evidence of different kinds, extending from p. 1 to p. 95, D. S.—reb.—

EPHRAIM R. HOLSINGER (D. Vol. 1, pp. 360-75) first saw F and B, then A, and then D and E. (Ans. 23.) In the summer of 1875 he helped Drawbaugh experiment, using D and E. (Ans. 34.) Before seeing F or B he saw I, but Drawbaugh did not inform him what it was, (Ans. 24, 25.) Inasmuch as he saw D and E as early as the summer of 1875, F and B before he saw D and E. and I before he saw F and B, it must have been earlier than the summer of 1875 when he saw I.

Besides the above witnesses who were examined in the case of the People's Telephone Company, there were a number of additional witnesses to Exhibits C and I afterwards examined in the Overland case, to wit:

JOHN M. WOODBURN, candidate for county treasurer in July. 1873, and his friend, GEORGE EMRICK, who were at Drawbaugh's shop together on political business July

14, 1873, and whose testimony is found in Add. Proofs, pp. 130-138. They both saw and talked about the telephone, and saw it operated, and they concur (Emrick, Ans. 26, Woodburn, Ans. 36) in recognizing the similarity of Exhibit I to the instrument which they saw in the basement of the shop at that time.

DAVID STEVENSON, JR., (Add. Proofs, 141-155) and his two daughters, ALICE M. STEVENSON (Id., pp. 164-169) and FLORENCE A. STEVENSON (Id., pp. 169-171), who were all together at Drawbaugh's shop one afternoon in some *chestnut season* prior to the year 1875. The date is fixed by the fact that they were at the time living in the house at the corner of 3d and Chestnut streets, Harrisburg, which house they ceased to occupy on September 1, 1875. While at Drawbaugh's shop on that occasion they talked to each other and to Mr. Drawbaugh through his telephones. They testify that they talked *back and forth, asking questions and getting answers*, through the telephones. Therefore the carbon instruments, F and B, could not alone have been used, for they can talk *only one way*, and if those instruments were used there must have been also another set of instruments in use with which to answer back. As this visit was probably in the fall of 1874 (certainly not *later* than that), at which date C and I had been in existence about three years, these latter instruments were undoubtedly the ones which they used. These two instruments, it will be remembered, are *magneto* telephones, talking equally well both ways.

MRS. DRAWBAUGH (Add. Proofs, pp. 221-233) fully corroborates her husband's testimony as to his talking to her at their home through the telephone in the fall of 1872, just after the birth of her son Charles, and before she had risen from child-bed. Mr. Drawbaugh had testified in the People's Telephone Company suit, that the instrument used on this occasion was C. (D. Vol. 2, p. 823-4, Ans. 376-7.)

WILSON H. STRICKLER (Add. Proofs, pp. 233-242), one of the most important and conclusive witnesses in the whole case, testified that, in the summer of 1874, and before the 22d day of August, 1874, he saw Exhibit C at Drawbaugh's shop. On that occasion Drawbaugh talked to him through the telephone, and described to him the principle of the machine, and how he generated the electric current used on it. The witness never saw Drawbaugh on any other occasion, and never was in Milltown in his life, except on that one day. His identification of Exhibit C is complete.

It will be seen from the above that Instruments C and I are identified by forty-nine witnesses, besides Daniel Drawbaugh, as having been seen by them at Drawbaugh's shop prior to February 14, 1876, and by forty-eight as having been seen prior to June, 1875; and, of these witnesses, *sixteen*, viz.: Sternberger, Otstot, Senseman, Hosler, Prof. Heiges, Mrs. Eicholz, Herr, Bayler, Sutton, Updegrove, Draper, Weber, Vannasdale, Strickler, Woodburn, and J. H. Smith, *were never in Drawbaugh's shop after the date of Bell's earliest experiment of June 2, 1875.*

We also call the attention of the court to the fact that in the testimony of Zearing, Woodburn and Emrick, *the very day of the use of these instruments successfully is proved* by reference to records made at the time, and relating to the business which caused the witnesses to be there. Such facts leave no room for debating the question of priority.

Exhibit A.

In the order of Drawbaugh's development of the speaking telephone, Instrument A was produced next after C and I. It was made after C and I. (Drawbaugh, D. Vol. 2, p. 788, Ans. 225), but before D and E (Id. Ans. 246, p. 791.) *It was not made before the sale to the Haucks in July*, 1873, *but was made prior to the axle company.** (Id. Ans. 401, 405.) At first, the mouthpiece was in the centre, and there was no adjusting screw at the centre. (Id. Ans. 226.) The diaphragm, as thus arranged, was found to vibrate too easily, and, to remedy that defect, he placed a piece of soft rubber (a "dampening pad") on its centre, and arranged a brass screw to run through the centre of the lid and bear on that rubber (Ans. 228), which remedied the defect to some extent. (Ans. 229.) This change was made somewhere from two to twelve months after the instrument was originally constructed. (Ans. 227.) At the same time when this change was made, the mouthpiece was changed to one side of the centre, to get room for the screw. (Ans. 238.) Some experiments were made to test the effect of different thicknesses of diaphragm; but no other changes than these now stated were ever made in the instrument. (Ans. 236, 237.) The magnets on it were never changed. (Ans. 1,699.) No change was ever made in Instrument A after the formation of the axle company. (Ans. 1,701.) It was never out of condition for use at any time, except when Mr. Knight was making some drawings of it, and separated some of the wires. (Ans. 327.)

---

* The axle company was formed Dec. 23, 1874. (J. A. Moore, D. Vol. I., p. 614.)

No parts of it ever had to be searched for. (Ans. 1,731.) The original Instrument A, thus made and completed prior to the axle company is in evidence as Exhibit A. (p. 788.)

This instrument A is a telephone receiver (Ans. 234), that is to say, it has a diaphragm with armature attached, and an electro-magnet to set the diaphragm in vibration by means of a current coming in through the line, but it has no permanent magnet arranged so as to normally polarize the electro-magnet. It is represented in defendant's book of drawings, p. 1, and is clearly described in Drawbaugh's testimony (Ans. 239), and in Park Benjamin's testimony (Ans. 31, 33), and is in court to speak for itself, and Mr. Benjamin testifies that it is a good practical working receiver, and fully anticipates Mr. Bell's patent of March 7, 1876. The complainant's counsel, in their brief in the Overland case below, describe it as follows: "A is a "*highly organized magneto-receiver*, with a neutral mag-"net. The case is of black walnut, nicely turned, and "furnished with screw cups to attach the line wires to." (p. 77.) It was used on different lines in the shop, with different transmitters (Ans. 232), including the battery transmitter F and the magneto transmitter C. (Ans. 230.) It was a pretty good receiver, but not quite so loud as the magneto-telephone I (Ans. 231), and answered better with a battery transmitter than with a magneto-transmitter. (Ans. 1365–1367.) Words, sentences, and all sorts of sounds were heard through it. (Ans. 231, 233, 234.) It was satisfactory to him. (Ans. 234.) He talked to a great many different people through it. (Ans. 235.) It was kept in different parts of the shop—sometimes in a drawer in his desk. (Ans. 1368, 1369.)

This statement is corroborated, in all particulars, by a "great cloud of witnesses," whose testimony shows that the application of the dampening pad and adjusting screw, at the centre, and the removal of the mouthpiece to one side of the centre to accommodate the screw, took place before January, 1875, and probably in the fall of 1874.

WILLIAM H. BATES (D. Vol. 1, pp. 419-426) was at the shop in August, 1875, and then saw instruments A, D and E there. (Ans. 17.) Drawbaugh, when he showed them to witness at that time, said that "he "thought he had the talking machine completed." (Cross-ans. 31-33.) This was about August 13-15, 1875. (Ans. 65.) He had a good deal of talk with Drawbaugh about them, and about patenting them. (pp. 422-25.)

SAMUEL C. CRAWFORD (Id. pp. 62-6) was at the shop in the fall of 1874 (Ans. 2, 3), before cold weather (Ans. 7-11), and between June 10, 1874, when witness' leg was amputated, and the date when the Axle Company was formed and commenced business in the shop. (Ans. 14, 15). *After this visit*, witness was in Mr. Bear's employment for some time. (Ans. 16). When there, on that occasion in the fall of 1874, witness saw this instrument, A, lying in the shop, and asked Drawbaugh if it was a telegraph-sounder, and Drawbaugh replied, "No, sir; it "is a talking machine." Capt. Moore, one of the axle company, testifies (Id. p. 616, Ans. 12, 13, 14) that Crawford was in the employ of Bear and Kline before December 23, 1874, "I would suppose about two months before "December 23."

DANIEL B. CONDRY (Id., pp. 138-43) saw A on Christmas, 1875, or shortly after. (Ans., 8.)

HENRY M. DARR (Id., pp. 272-5) saw and heard talk through A in the spring of 1875, before haymaking, and understood through the instrument what was said. (Ans., 7–24.) Witness was on the first floor, and Drawbaugh was in the cellar basement. (Ans., 17, 18.) Wires were connected to A. (Ans., 21.) Witness did not go down into the cellar to see the transmitting instrument. (Ans., 23.) Drawbaugh said "it could be made that "you could talk to New York." (Ans., 22.)

HARMAN K. DRAWBAUGH (Id., pp. 550–71) saw A in the beginning of 1875, and it was then in its present condition. (Ans., 30, 32.) He had seen it before that, without the adjusting screw, and with the mouthpiece at the centre. (Ans., 31.)

CHRISTIAN EBERLY (Id., p. 115) thinks he saw it prior to December 22, 1870. (Ans., 18, 19); but he evidently confounds it with some other instrument, possibly C or I, as Mr. Drawbaugh thinks, and the evidence tends to show that it was not in existence at that time.

JACOB F. ENSMINGER (D. S–reb. pp. 808–815) saw A on February 2 and 3, 1875. (Ans. 24, 28, 29.) He remembers the electro-magnet partially covered by the brass plate, and thinks the instrument was in the same condition as now.

WILLIAM EPPLEY (D. Vol. 1, pp. 280–3) saw something which he identifies as similar to instrument A lying on Drawbaugh's desk at same time when he (witness) was at the shop. (Ans. 18, 6, 7.) Witness was never at Drawbaugh's shop after May or June, 1875. (Ans. 4, 5.)

MARY A. EVANS (D. S.–reb. pp. 61–74) saw A at the shop about the 1st of December, 1875. (Ans. 31, 23.)

SARAH E. EVANS (Id. pp. 55–60) was at the shop with Mary A. Evans about the 1st of December, 1875, and saw A there at the time. (Ans. 28, 9, 10, 26.) *Was never there afterward.* (Ans. 31, 32.)

ABRAHAM FISHER (D. Vol. 2, pp. 688–91; recalled, pp. 1121–23) was at Drawbaugh's shop to get a hydraulic ram in June, 1873, and thinks that he saw A there at the time, but would not testify positively to the fact.

GEORGE FREE (D. Vol. 1, pp. 484–90), was at Drawbaugh's shop on or about June 21, 1875 (see John A. Oyster, pp. 491–94, Ans. 5), and listened at A (Ans. 18), in the cellar, where witness was (Ans. 21), while Drawbaugh, on the second story of the machine-shop (Ans. 8), talked and sang through the transmitter (Ans. 7–14); he understood part of the words and could distinguish Drawbaugh's voice. (Ans. 12, 15, 16.) The instruments were connected by two wires. (Ans. 25.) Drawbaugh showed him the batteries used on the machines. (Ans. 22–24.) Machine A is in the same condition as it was then. (Cross-Ans. 42.) Mr. Drawbaugh told him at the time that the talking machine could be used to talk from Philadelphia to California. John A. Oyster was with witness at the time.

JEREMIAH FRY (Id. pp. 143–50) was at the shop about April 9, 1875, and among other talking machines saw instruments A, D and E. (Ans. 12, 13.) Drawbaugh sang through the machines to witness. Witness could hear. (Ans. 14, 15.) Drawbaugh told witness at the time that it was a talking machine, and that he could talk with it as far as the wire goes. (Ans. 16, 18.)

ELIAS GRAYBILL (D. S—reb. pp. 184–206.) Prior to September, 1875 (Ans. 13), and witness thinks in the forepart of the summer of 1875 (Ans. 14), had a conversation with Mr. Drawbaugh about the talking machine, opposite the station house at White Hill (Ans. 15), during which Drawbaugh showed him a talking machine which he had in his hand or pocket (Ans. 20–26), and which he (witness) recognizes as Exhibit A. (Ans. 29.)

MICHAEL M. GROVE, a member of the axle company (D. Vol. 1, pp. 662–5) had a talk with Mr. Drawbaugh about his talking machine shortly after the Axle Company began, and he thinks it was the first time that he went to the shop after signing the articles of agreement on December 23, 1874. (Ans. 1–4.) Mr. Drawbaugh at that time showed him a talking machine, and stated to him that if he would talk into it you could hear him at Pittsburg. (Ans. 1.) Witness recognizes Instruments A and D, as looking like the machines that Drawbaugh showed to him at the time he made the remark above referred to. (Ans. 6.)

DANIEL A. HAMACHER (Id., pp. 289–310) was at Drawbaugh's shop with some of his scholars on February 1, 1876 (Ans. 4, 5, 6), and then and there saw Instrument A and a number of other talking machines which he is unable to identify. (Ans. 13, 14.) Drawbaugh told him at the time that they were to convey words by electricity; that the time would come when you could speak to San Francisco; and that the talking machine would take the place of the telegraph. (Ans. 16–18.) He also showed him telegraph instruments at the same time, and just before he showed him the talking machine. (Ans. 19, 22.) *Witness was never at the shop afterwards until the beginning of the year* 1879 (Ans. 24), at which time he saw talking machines, but they were different from those which he saw February 1, 1876. (Ans. 25, 26.)

EPHRAIM R. HOLSINGER (Id. pp. 360–63) saw Mr. Drawbaugh making Instrument A (Ans. 23) before he saw Instruments D and E (Ans. 33), and saw Instruments D and E as early as the middle of the summer of 1875. (Ans. 34.) Talked through the talking machines a great deal while he lived at Eberly's Mills, from September 13, 1873, to November 23, 1876, *but never was at Eberly's Mills since the latter date.* (Ans. 9.)

N. N. HUBLER (D. Vol. 2, pp. 691–2) was at Drawbaugh's shop about January, 1874 (Ans. 4, 5), and saw some of his talking machines there (Ans. 5), among which he thinks A was one, but is not positive. (Ans. 5.)

WILLIAM F. LENIG (Id. pp. 698–700) was there with Hubler in January or February, 1874 (Ans. 1, 10), and saw talking machines, among which, he thinks, was A. (Ans. 7, 8, 9.)

AUGUSTUS KAHNEY (D. S—reb. pp. 254–266) helped put the Axle Company's machinery into the shop in March, 1875 (Ans. 38), and then saw two talking machines there (Ans. 40), which he identifies as A and E. (*Ans. 47, and Examiner's certificate following Answer 47.*)

IRA D. KAHNEY (D. Vol. 1, pp. 201–5) saw A in the shop in the years 1873 or 1874 (Ans. 25, 26), and heard talk through it down stairs while Drawbaugh was transmitting up stairs. (Ans. 27–30.) Witness used A as a receiver (Ans. 31), and understood through it what was said. (Ans. 32.)

JEREMIAH KOHLER (Id. pp. 543–7) was at the shop in 1873 (Ans. 3), and saw, among other talking machines, Instrument A. (Ans. 4.) Drawbaugh was then making it. (Ans. 5.) Witness remembers the brass plate and electro-magnet on the back of the instrument (Ans. 7), but does not remember the position of the mouthpiece at that time. (Ans. 6.) While he lived at Milltown from April, 1873, to April, 1874 (Ans. 1), Drawbaugh talked through the talking machine to him (Ans. 8) from the lower floor to the second floor (Ans. 9), and he heard and understood through the machines what was said. (Ans. 10.)

MICHAEL KONN (Id. pp. 129-32), was at the shop in November, 1874, when J. M. Waggoner was there (Ans. 3-16), and saw Drawbaugh explaining Exhibit A to Waggoner (Ans. 17), and distinctly remembers the instrument (Ans. 18). Drawbaugh told Waggoner that it was "for electricity." (Ans. 20.) Witness never saw Waggoner after that. (Ans. 39.)

ROBERT McCLEAF (D. S—reb. pp. 815-820) was at the shop-basement with his father, making cider (Ans. 12, 13, 14), while his father lived near Milltown (Ans. 8), before Wilson's store blew up. (Ans. 11.) His father moved away in the spring of 1875 (Ans. 41), and the store blew up on January 19, 1875. (C. Exhibits, p. 401.) Witness does not remember ever being in the shop except that once (Ans. 9), and never was there since the store blew up. (Ans. 11.) On the occasion when he was there, Drawbaugh talked to witness' father through the talking machine, and his father said he "heard it very plainly." (Ans. 17-21.) He identifies instrument A as one that he saw there that day. (Ans. 23.)

ISAAC B. MILLARD (D. Vol. I, pp. 324-34), saw A, D and E at the shop in the year 1875, the year that he moved on to the farm. (Ans. 12, 29, 30, 31, 42.) His last visit to Drawbaugh's shop prior to 1880 was in cold weather (Ans. 48), some time before the opening of the Centennial. (Ans. 46.) He saw A before he saw D and E, and saw the latter not later than cold weather, before the Centennial. (Ans. 49.) Drawbaugh talked to him through A, the witness using it as a receiver in the second story, while Drawbaugh used a transmitter in the lower part of the building (Ans. 32, 33), and witness heard and understood what was said. (Ans. 34.) Two wires were at the time attached to the binding-posts of A.

(Ans. 31.) Drawbaugh told him how to listen (Ans. 82), and he placed his ear at the hole in A. (Ans. 31.) He saw the transmitter at the time, but cannot now identify it. (Ans. 81, 82.)

Dr. John W. Moffitt (Id. pp. 494–500) first knew of Drawbaugh's having talking machines in the year 1873 (Ans. 5), and either at that time or within a month afterwards (Ans. 13, 14), saw A and listened at it while Drawbaugh, in some other part of the building, talked to him. (Ans. 13.) He heard the words, and remembers the sentence, "Do you hear me talk?" Drawbaugh then explained the principle on which the machine operated, and alluded to the vibration of a bee's wing in illustration of the vibrations of the diaphragm. (Id.)

Urias R. Nichols (Id. pp. 89–97) was at the shop about January 18, 1875 (Ans. 4–18), and then saw A and B. (Ans. 18.) Drawbaugh attached the wires to the binding-posts on A in his presence (Ans. 25, 26), and then a boy talked to him, witness listening at A, and the boy being about 200 feet away (Ans. 28, 29, 31, 34), and he heard the boy say through the machine, "Is it you, father, speaking?"

John A. Oyster (Id. pp. 490–4) was at the shop with Geo. Free (see Free's testimony, Id., p. 484) on or about June 21, 1875 (Ans. 3–5), and witnessed Drawbaugh's talking to Free (Ans. 15, 16), and identifies A as one of the talking machines which he then saw there. (Ans. 17.)

Jacob M. Peterman (D. S-reb., pp. 471–476) was at Drawbaugh's shop in September, 1874 (Ans. 16, 30, 31, 34), and saw A. (Ans. 28, 29.) He has never been there since. (Ans. 23.)

Jacob H. Reneker (D. Vol. 1, pp. 233–44) was a the shop in May, 1875 (Ans. 4, 5, 7), and, through A as a receiver, heard and distinctly understood words and music. (Ans. 15–21.) The speaking was done on the second floor, and the listening on the first floor (Ans. 13), and it was impossible to hear what was said except through the machines. (Ans. 22.)

DANIEL RUPP (Id. pp. 427–39) saw talking machines at the shop in June or July, 1874 (Ans. 5, 6), and afterwards saw other talking machines there. (Ans. 11.) Identifies A as an instrument which Drawbaugh gave him to put to his ear at his first visit in June or July. (Ans. 21, 8, 15.)

JOHN F. RUPP (Id. pp. 311–14) was at the shop on February 1, 1876, with his teacher, D. A. Hamacher, and other scholars (see Hamacher, Id. p. 289; Strong, Id. p. 375; Deft's Exhibits, pp. 14, 15), and saw A. (Ans. 9, 10, 11, 12.) *Has never been in the shop since.* (Ans. 32.) *In February, 1876, the time of the visit, witness was a few weeks over twenty-one years old, and never attended school afterwards.* (Ans. 3–8.)

JOHN SCHERICH (Id. pp. 176–82) lived at Camp Hill from April 1, 1873, to April 1, 1875. (Ans. 3.) While living there saw A at Drawbaugh's shop (Ans. 13), when down there to make cider. (Ans. 14.) *Was never there afterwards.* (Ans. 16.) Drawbaugh talked through the instruments at the time (Ans. 17), and witness listened at A (Ans. 18, 19), and heard what was said (Ans. 20), although witness was on third floor (Ans. 22), and Drawbaugh was down in the basement. (Ans. 23.) Saw the instrument that Drawbaugh talked into, and it was not F (Ans. 24, 25, 26), but looked like I. (Ans. 28.) This was in the fall of 1874. (Ans. 27.) Drawbaugh sold that cider-mill to Elias Hake in the summer or fall of

1875. (See Drawbaugh p. 888; Ans. 759, D, vol. 2); and it was in use at Hake's mill in 1876. (See S. N. Emminger, C, Vol. 1, Ans. 20.) Complainants' witness, John Kahney (C, Vol. 3, p. 2054. Ans. 180; p. 2041, Ans. 62), fixes the fact of the cider mill being in the basement of Drawbaugh's shop in the fall of 1874.

JACOB E. SHETTLE (Id. pp. 206-25) saw D and E in 1875 (Ans. 25), and saw A before he saw D and E (Ans. 27), but how long before, can't say. (Id.) Drawbaugh at the time showed him how to adjust A to receive words —screwed it up, and with his breath, or the power of his voice, made it buzz like a bee. (Ans. 29.) A, D, and E were about in the same condition when witness first saw them as now. (Cross-Ans. 139.)

A. B. SHANK (Id. pp. 19-41) saw A "just about when "the Axle Company came into operation." (Ans. 53.) "It was just about that time or, rather, a little before." (Ans. 97.) Witness had it to his ear, and used it for listening at. (Ans. 98, 99.)

JACOB S. SHOPP (Id. pp. 387-92) was never at Drawbaugh's shop since 1874 or 1875 (Ans. 18-20), and then saw A, D and E. (Ans. 22-29.)

JOHN SIMMONS (D. S-reb., pp. 427—441) was at Drawbaugh's shop with Jacob Evans in November, 1875 (Ans. 1-10), and identifies Exhibits A and E as instruments through which Mr. Drawbaugh talked to Evans and witness at the time (Ans. 11-17); witness had heard of Drawbaugh's talking machines at least a year before that visit. (Ans. 18, 19.) Witness went to live at Milltown in 1876 (Cross-Ans. 24), and the visit with Evans to Drawbaugh's shop was in 1875, before witness moved to Milltown. (Ans. 101.)

D. W. SMITH (D. Vol. 1, pp. 66-73) was never at

Drawbaugh's shop after the beginning of 1875, when witness moved to Harrisburg (Cross-Ans. 22–24, and 44); moved to Milltown in the fall of 1874, right after corn-husking, and lived there two months, then moved to Harrisburg (Ans. 3, 4, 5, 6). While living at Milltown was in Drawbaugh's shop and saw him working upon mouthpiece and screws of Instrument A (Ans. 8–10), and this was soon after witness moved to Milltown. (Ans. 11–14.) *It is probable that the work which witness saw Drawbaugh doing upon the screws and mouthpiece of Instrument A in the fall of 1874 consisted in the application of the adjusting screw at the center of the diaphragm, and the removal of the mouthpiece to one side of the center*, as explained in Mr. Drawbaugh's testimony. (D. Vol. 2.)

John H. Smith (D. Vol. 2, pp. 1093–8) visited Drawbaugh's shop in May, 1875 (Ans. 3), and was never there before nor since that visit. (Ans. 12.) While there saw Instrument A and took it in his hand; recollects particularly its general shape, and its mouthpiece shaped like mouthpiece of a bugle. (Ans. 7, 4.) Witness' date is corroborated by Dr. Updegraff, who was there with him. (Id. p. 1,082.)

Dr. C. E. Updegraff (Id. pp. 1081–93) was at Drawbaugh's shop about May 5, 1874 (Ans. 1–3); again about April 20, 1875 (Ans. 4); and again, about May 15, 1875 (Ans. 9); and thinks he was never there afterwards. (Ans. 13.) At either his first or second visit saw Instrument A there. (Ans. 26.)

Jacob R. Vannasdale (D. S-reb. pp. 788–798) was at Drawbaugh's shop with Jacob F. Ensminger on February 2 and 3, 1875 (Ans. 18), and was never there before nor since. (Ans. 18, 19.) While there on that occasion, saw Instrument A (Ans. 28), and recollects that he thought that the mouth orifice was to look into, and asked Mr. Drawbaugh whether such was the fact, or not, and Mr. Drawbaugh laughed about it. (Ans. 29, 30.)

JOHN M. WAGGONER (D. Vol. 1, pp. 122-128) was at Drawbaugh's shop in November, 1874 (Ans. 1-8), and saw machine A there. (Ans. 9.) Drawbaugh told witness that he had talked through it, and had it perfected. (Ans. 24.) Witness is positive about Instrument A, because he had it in his hand and looked at it, and recollects the mouthpiece at one side of the center as it is now, and the electro-magnet on the side opposite the mouthpiece. (Ans. 27-29.)

Drawbaugh said at the time that it was perfected, and he was going to patent it, and if he got a patent on it, *it would be the first patent on a talking machine in the United States, or probably in the world;* but like all other machinery there would be improvements made on it in the course of time. (Ans. 24, 30, 37.)

JOHN WEBER (Id. pp. 244-8) was never at Drawbaugh's shop but three times, to wit: first, In the latter part of December, 1874; second, In the last two days of December, 1874; and third, At the latter end of January, 1875. (Ans. 4, 5, 20-22.) While there on the first visit, saw Instruments B, F, C and A. (Ans. 5½, 9, 13.) Drawbaugh said at the time that A was a receiver—"to receive what is talked," and F was a transmitter to talk into, and held Instrument A to his ear to explain the mode of using it. (Ans. 10-11.)

JOSEPH M. WISLER (Id. pp. 392-6) moved away from New Market, York county, in the spring of 1874 (Ans. 8-10); and while living at New Market, saw Instrument

B, at Drawbaugh's shop. (Ans. 13.) In the spring of 1875, saw Instruments D and E there, (Ans. 18), which Drawbaugh said he had just finished. (Ans. 19.) Prior to seeing Instruments D and E there, and it might have been a year prior, but witness is not positive how long, saw Instrument A at Drawbaugh's shop. (Ans. 20, 33.)

JOHN WOLF (D. Vol. 2, pp. 673-8), hauled the Axle Company's machinery to Drawbaugh's shop in February and March, 1875 (Ans. 1, 5), which date is verified by his account books (Ans. 3) and never was in the shop afterwards until the winter of 1879-80. (Ans. 13-15.) When hauling the Axle Company's machinery to the shop, saw various talking machines there, and, among others, Instrument A. (Ans. 7, 11, 20, 23.)

From this testimony it appears that forty-four witnesses besides Daniel Drawbaugh saw Instrument A at his shop prior to February 14, 1876; thirty-two prior to June 2, 1875; and sixteen prior to the beginning of 1875; and of the forty-four, fifteen bear testimony to its actual use for receiving articulate speech prior to the filing of Mr. Bell's application for his patent of March 7, 1876, and even prior to his first experiments. There can be no mistake about the dates fixed by these witnesses, for fifteen of them, viz., Eppley, Sarah E. Evans, McCleaf, Millard, Peterman, John F. Rupp, Scherich, Shopp, D. W. Smith, Dr. C. E. Updegraff, Vannasdale, Ensminger, Weber and Wolf, have never been in Drawbaugh's shop since February 1, 1876, and most of them never since June 1, 1875. It is therefore clearly established that Instrument A anticipates Mr. Bell's invention.

Exhibits D and E.

We come, then, to the next set of Mr. Drawbaugh's telephone instrumsnts, in the order of their development by him, viz., the magneto-telephone instrument "D" and "E."

Drawbaugh gives a full history of these two instruments. (D. Vol. 2, Ans. 243–266, pp. 791–794.) They were made after A (Ans. 246), but before "L" and "M" (Ans. 295) "G," "O" (Ans. 297) and "H" (Ans. 293, 294, 297.) They were made under Daniel Drawbaugh's directions, part of the work being done by him and part by Harman K. Drawbaugh. (Ans. 243.) The *original instruments* are in evidence as Exhibits "D" and "E," and are illustrated on page 6 of defendants' book of drawings, and fully described by Mr. Drawbaugh (Ans. 244, 250); Knight (D. Vol. 2, Ans. 120, 124, pp. 718–9); and Park Benjamin (Id. pp. 1191-5, 1214, Ans. 36, 37, 55). Mr. Benjamin testifies concerning them as follows, p. 1214:

> "The instruments 'D' and 'E' show the magneto-telephone in as compact a form as it has ever been constructed, up to the present time. The magnet is flattened and curled, so as to occupy the least possible space; the means of adjusting the distance between the core and diaphragm is simple, positive, and easily controlled; *and the instruments themselves, as I have proved, are excellent working, speaking telephones on a circuit without a battery.* They embody all the elements going to make up a speaking telephone, as described in Bell's two patents in suit; and, in fact, I see no reason why, if these machines were now manufactured and were upon the market, they would not, so far as form, construction and operation are concerned, successfully compete with any forms of magneto-telephone now in vogue."

As to their "excellent working" qualities, Mr. Benjamin testifies not from theory only but from personal tests made by him, as set forth in his answer 36, pp. 1193-4. They were also tested at New York City, in March, 1882, in presence of complainant's counsel and experts (see D, Vol. 2, pp. 1250-1), with many other of Mr. Drawbaugh's telephones; and the character, method, and resusts of these tests are fully set forth by Mr. Benjamin (pp. 1251-91). In these tests the original instruments, A, D, E, H, and others were used. At the beginning of the New York tests the wire of Exhibit D, which had become old and rotten, broke off at the surface of the electro-magnet, and, as defendants' counsel did not wish the coil to be changed in any respect by unwinding and rewinding, but, on the contrary, desired the instruments to remain in exactly their original condition, this Instrument, D, was laid aside, and its companion-instrument, E, was tested in its place, both as a transmitter and receiver, with different varieties of telephones in circuit with it. Two lines were employed, one equipped with Bell instruments and one with Drawbaugh instruments; and it was demonstrated by actual trial of the fact, that Instrument E could be substituted for either of the Bell instruments, and would transmit or receive speech with equally good articulation, eliciting the favorable comments of even the complainant's experts, Mr. Pope and others. Mr. Benjamin, D. Vol. 2, p. 1277, testifies as follows:

"Q. 136. You mentioned the fact that Mr. F. L. Pope listened in the front room at Instrument 'A' or 'E,' or both; after listening did he make any remarks indicating his satisfaction, or want of satisfaction?

"A. I was present in the room when Mr. Pope listened at the two instruments named, and I instructed the stenographer present on behalf of the defendants, to be particularly careful in noting down exactly what Mr. Pope said, if he should say anything at all, with regard to them.

On the stenographer's notes I find the following, which accords with my recollections of what Mr. Pope said:

"After hearing Judge Hill read to him the article already quoted in one of my previous answers, beginning 'Last Wednesday in San Francisco, a Mrs. Andrews,' which Mr. Pope heard through Instrument 'E,' the words being spoken into Instrument 'H' at the other end of the line, Mr. Pope said: 'I had no trouble at all in hearing anything spoken through Drawbaugh's instrument, and it compares as favorably with any telephone as I ever heard. Words that were indistinct was the fault of the transmitter and not of the receiver.'

"Mr. Pope also listened at Instrument 'A' to speech transmitted through Instrument 'H' and the line. During the course of the article on the new wheat regions, quoted in one of my previous answers, Mr. Pope said: 'That is good enough. Let the other man try it now.' I asked him, 'Don't you think it (meaning Instrument 'A') is as good as 'E'? Mr. Pope answered, 'That is first rate.' Mr. Pope then continued listening, and after another quite long section of the same article had been read to him—said section being quoted in one of my previous answers—said: 'That is enough.' I asked him, 'How is that for a receiver?' (meaning Instrument 'A.') He answered, 'That is very good indeed.'"

Mr. Frank L. Pope, complainants' expert, on cross-examination, testified as follows:

"Re-cross Q. 401. (C. Vol. 2, p. 1450.) Assuming that Drawbaugh made the instruments D and E in the early part of 1875, and that he either made the permanent magnets himself or employed the village blacksmith at Eberly's Mills to make them for him, would you expect them to be made of tungsten steel, and would you not consider it highly probable that they would partially lose their magnetism in the course of seven years?

"A. I don't think they would be likely to be made of tongsten steel, under the circumstances; *and hence it is possible that magnets so made might lose a portion of their magnetism during the length of time mentioned.*

"Re-cross Q. 402. If they did lose a portion of their magnetism, then the sounds transmitted and reproduced through such instruments would be proportionally weaker and fainter, would they not?

"A. *They would be weaker certainly.*

"Re-cross Q. 403. Considering that the instruments D and E were made with wooden boxes, liable to shrink and warp with age, and had been taken apart and put together a great many times by the draftsman, the counsel and the witnesses in the progress of this case, and had been transported by railroads and express companies, in a trunk, with a quantity of other materials, in addition to having been handled for several years prior to the institution of this suit, would you expect their conditon to be as good at the time the tests were made as when they were new?

"A. That might, or might not be the case. A magneto instrument will stand a great deal of rough handling without apparent injury, and its parts are very easily placed in proper relation to each other after having been displaced by rough usage. *Nevertheless, it is probable that the instrument would not perform as well after undergoing the vicissitudes mentioned in the question as when new.*"

And, after hearing these old original instruments tested, Mr. Pope was constrained to state, in his examination in chief by complainants' counsel (C., Vol. 2, pp. 1378-9), as follows:

"*I think that instruments like E might be successfully employed for practical use*, especially if there were no better ones to be had. *The articulation of E seemed to be very good*, but the sound was wanting in volume and loudness."

And, on page 1380, as follows:

"Q. 102. From the stenographer's notes, quoted on p. 1325 of Mr. Benjamin's deposition, it appears that some special pains were taken to report 'exactly' what you said on one occasion during the tests. It is evident, from the ingeniously bad grammar of the reporter, that he did not report 'exactly' what you said. Did you form or express the opinion that E or A were as good as the receivers in ordinary use, and to which you have been accustomed, such as the 'pony-crown' or 'butter-stamp' forms?

"A. *The remarks attributed to me, I think, are correctly reported with the exception of the first one.* I have no recollection of using the expression, 'And it compares as favorably with any telephone as I ever heard.' I do not believe that I made use of this expression, *although it is not unlikely that I used a phrase similar to that quoted, as to the articulation of the receiver.* The context seems to indicate that such was the case, inasmuch as the expression quoted is immediately followed by the following: 'Words that were indistinct was the fault of the transmitter and not of the receiver.' I did not at any time form an opinion that Drawbaugh's apparatus, as a whole, compared favorably with any telephone I ever heard. *It is quite possible that I may have said that the articulation of E was as good as that of other telephones,* but I did not think it equal to others in volume of sound, and certainly did not intend to say so."

We prefer to take the reporter's notes, made at the time, of what Mr. Pope said, rather than Mr. Pope's memory, a year afterwards, and after full consultation with complainants' counsel. In either case, however, here is the admission of complainants' expert that Drawbaugh's instruments A and E were good articulating speaking telephones, even after many years of rough usage and natural decay, and that instruments such as E can be "successfully employed for practical use" on "telephone lines."

As to the rough usage to which Mr. Drawbaugh's instruments had been necessarily subjected during the progress of the suit, see Mr. Benjamin's answer 115, D. Vol. 2, pp. 1254-6, and Drawbaugh's answer, 257, 258, p. 793. It is quite remarkable that instruments, after such handling, should remain capable of any results whatever; yet these instruments still talked, and could be used interchangeably with the modern improved telephone. Drawbaugh testifies (Ans. 1758, p. 1080) that three years prior to the commecement of this suit they were in better condition than when he was giving his testimony. The complainants' counsel, in their brief, in the Overland case, referred to these two instruments as follows:

> "D and E are a pair of magneto instruments with permanent magnets. *They are highly organized* inclosed in turned black walnut cases, *and with most of the refined improvements of detail found in the best commercial instruments of to-day*, though they are rather feeble." (P. 77.)

The two instruments, D and E, here in evidence, were made in the latter part of the winter of 1874–5, before the Axle Company got its new machinery into the shop in March, 1875; and, from that time to this, they have been in existence, and in an operative condition. After they were first made, no change was ever made in them, except the cutting of a slight recess in "D," immediately below the diaphgram (D, Drawbaugh, D. Vol. 2, pp. 792–3, Ans. 254), which, however, had no effect on the operation of the instrument (Id. Ans. 255, 256; P. Benjamin, p. 1195, Ans. 37), and except the occasional testing of diaphragms of different thickness on them (Drawbaugh, Ans. 1700), the magnets and electro-magnets have never been changed since the instruments were first constructed. (Id. Ans. 1700.) A little screw plug was, at some time prior to the filing of the instruments in evidence, lost from Instrument E, and the bottom cover at an early time, from Instrument D (Ans. 251–254), but otherwise the instruments are identically as first made, wear and tear excepted.

The evidence which fixes the date of D and E, as prior to February 14, 1876, and even months prior to Bell's earliest experiment of June 2, 1875, is as follows:

DANIEL DRAWBAUGH (D. Vol. 2) knows that while the Axle Company was running at the shop (March, 1875, to February 29, 1876; J. A. Moore, D. Vol. 1, p. 614), he had "D" and "E," and may have had them prior to the Axle Company, but is unable to recall the date when he first made them. (Ans. 401, p. 827–8.) He remembers that parts of them were made by himself, and parts by Harman K. Drawbaugh, under his directions (Ans. 243); that there was one of them made and Harman made or helped to make the other. (Ans. 265.)

HARMAN K. DRAWBAUGH (D. Vol. I, pp. 550–71) saw one of these instruments, D or E, as far back as January, 1875, and the other not more than ten days or two weeks thereafter. (Ans. 44.) They both worked satisfactorily some time before the Axle Company got its machinery in there. (Ans. 47.) Witness talked through them and saw others talking through them (Ans. 48), and often listened at them (Ans. 49), and could hear and understand what was said. (Ans. 50.) Witness commenced working directly for the Axle Company on March 29, 1875 (Ans. 37), which date he fixes by his account book (Ans. 163; and see, also, Moore, Id. pp. 618–19, Ans. 18), and saw instruments "D" and "E" a month before he began work for said Company. (Ans. 51.) For the use of "D" and "E" a long telephone line was established in the shop, by extending the wires up into the garret and winding them back and forth several times from one end of the building to the other, to gain length or distance (Ans. 96, 97), and they were used on that line. (Ans. 98.) At first, they were tested with batteries. (Ans. 100, 101.) Witness spoke through them quite often. (Ans. 102.) Before making "D" and "E," Daniel Drawbaugh had two similar machines, which were roughly made, and in January and February, 1875, he and witness made new cases and practically reconstructed the machines, producing them as they now exist. (Ans. 117–128.) *They have not been changed in any way since that time.* (Ans. 129.) *Witness could, at any time from January or February, 1875, to the present time, from his unaided memory, and without having "D" or "E" before him, have reproduced substantially similar machines, except in point of perfect accuracy as to size.* (Ans. 130.) Witness himself forged one of the curled permanent magnets found on these instruments (Ans. 131), and his uncle, Daniel, made the other. (Id.)

Jacob R. Vannasdale (D. S-reb. pp. 788–798), was at the shop with Jacob F. Ensminger, on February 2 and 3, 1875, and saw a part of "D" or "E" which was then in course of construction.

> "Now we saw this curled magnet" [indicating the curled permanent magnet on Exhibit "D"], "but it was not put together this way. This curled magnet, it appears to me, was lying with these others, but not fastened to any block; I know we was looking at this curled magnet, and he told us that it belonged to a talking machine; this mouthpiece here ('E'), I don't recognize that; I may have seen it there, too." (Ans. 28, p. 791.)

Witness was never in the shop after February 3, 1875, (Ans. 18.)

Jacob F. Ensminger (D. S–reb. pp. 808–815), who was there with Vannasdale on February 2 and 3, 1875, a few days after the explosion of Wilson's store on January 19, 1875 (Ans. 12, 13, etc.; C. Exhibits, p. 401), testifies (p. 811) as follows:

> "Here are three, the only ones that I can identify" [taking up "A," "D," and the permanent magnet of "C reproduced"]. "This one" [taking up Instrument "D"] "I can identify only in part."

"Q. 25. What part of the Instrument "D" is it that you can identify?

A. The magnet only.

Q. 26. At the time when you were there at Mr. Drawbaugh's shop, where did you see this magnet which now appears on Instrument "D," and what, if anything, was said or done about it while you were there?

A. It was lying on Mr. Drawbaugh's work-bench in the shape that it is now, only that it wasn't polished and finished as it is now; he had just worked it out of the rough, and said that it belonged to his talking machine.

Q. 27. Referring to this curled magnet that you are now speaking about, did Mr. Drawbaugh say what, if anything, he was doing with it or about it at that time, so far as you remember?

A. I do not remember that he said or was doing anything about it, more than he said it belonged to his talking machine; that is all I remember about the curled magnet; the reason that I call it that—I heard him speak about it."

This witness never was in the village of Milltown in his life, except on that one occasion. (Ans. 1.)

Augustus Kahney (D. S-reb. pp. 254-266.) Helped to get the Axle Company's machinery into the shop and clean it up in the spring of 1875. (Ans. 31-39, p. 258.) This machinery was hauled there by Wolf on different days from February 20 to March 31, 1875 (Wolf, D. Vol. 2, p. 674), and was paid for by cheques in March, 1875. (Moore, D. Vol. 1, p. 617. Ans. 15, 16.) At that time witness saw "A" and an instrument which he describes as follows: "One was about two "inches through, and, as near as I can tell, from an inch "to two inches high, with a mouthpiece on top of it." (Ans. 40.) Having thus described the machine, he was sent with the examiner, Mr. Ott, to the examiner's office to look at the exhibits there, and immediately identified instrument "E" as the one to which he had referred. (Ans. 47, and Examiner's certificate following.)

GEORGE A. MAY (D. S-reb. pp. 982-995) was at Drawbaugh's shop in March, 1875 (Ans. 19-20), while living with Jonathan Fry (Ans. 21, 1-6), to get a razor ground. (Ans. 22, 23.) He delivered the razor to Drawbaugh at his house (Ans. 23, 24), and got it back from him about two weeks afterwards at the shop. (Ans. 25, 26, 27.) When he took the razor to Mr. Drawbaugh's house, Drawbaugh was living in the house at the blacksmith shop, which he sold to Fettrow in March, 1876, and never lived in afterwards. (Ans. 141, 142; also see testimony of D. Drawbaugh and D. Fettrow.) When he went to the shop to get the razor, the axle work was going on. (Ans. 38, 39, 40, 41.) He then saw "D" and "E" (Ans. 42), and Drawbaugh and witness talked to each other through them (Ans. 43, 33), witness using the same instrument both as a transmitter and a receiver. (Ans. 45, 46.) He heard and understood both words and music through the instruments (Ans. 47-56), and states some of the conversation that was carried on through them at the time. (Ans. 51, 55.) Witness thinks he saw "H" there at the same time, but in this he is probably in error—he did not use any talking machines except "D" and "E" (Ans. 56), nor examine "H" closely (Ans. 61), nor handle it (Ans. 62), nor was it explained to him (Ans. 63), and he probably confounds some other instrument with "H." But he did see and handle and converse through "D" and "E," and cannot well be in error as to them. The instruments, too, *talked both ways*, which would clearly indicate "D" and "E," or else "C" and "I," and he could hardly mistake "C" or "I" for the small instruments "D" or "E."

Daniel Fettrow (D. Vol. 1, pp. 347–60) was down at Drawbaugh's shop when the Axle Company were putting up their machinery (March, 1875), to get instructions about making some levers for said company. (Ans. 16.) The first work which he did for said Company is shown by his books to have been done on March 26, 1875. (Ans. 5–8.) While witness was there to get said instructions, Drawbaugh showed him Instrument "D" or "E" (Ans. 18), which witness (a blacksmith) identifies by the curled magnet (Id.), and they conversed together through the machines. (Ans. 16–22.) Witness used the same curled magnet instrument both as a transmitter and a receiver (Ans. 20), and remembers some of the conversation that was carried on by him and Mr. Drawbaugh through the machines. (Ans. 16–18.) The instrument which witness used, not only had a curled magnet on it, but was of the size of "D," and had a mouthpiece similar to that of "D." (Ans. 21.) Witness did not see the instrument that Drawbaugh used (Ans. 19), but it was probably "E," as they talked both ways.

Michael M. Grove (Id. pp. 662–5), a member of the Axle Company, testifies that shortly after the Axle Company copartnership agreement of December 23, 1874, was signed (Ans. 1–4), Drawbaugh showed him the talking machines, and told him they could talk to Pittsburg (Ans. 1), and he states that Exhibits "A" and "D" look to him as if they are the ones that Drawbaugh then showed him. (Ans. 6.)

Jeremiah Fry (Id. pp. 143–50) saw "B," "F," "A," "D" and "E," on or about April 9, 1875 (Ans. 7, 13), and Drawbaugh sang to him through some of them (Ans. 14), and stated that he could talk as far as the wire goes (Ans. 18). Witness identifies "D" or "E," as the machine which he used, but cannot say which, as they are almost exactly alike. (Ans. 19, 20.) He fixes the date by a book entry of the transaction which took him to the shop that day, viz.: the sale of some potatoes to Mr. Drawbaugh. (Ans. 8–11.)

JOSEPH M. WISLER (Id. pp. 392–6) saw "D" and "E" at Drawbaugh's shop in the spring of 1875 (Ans. 18). Drawbaugh said he had just finished them, and that you could put one to your mouth and talk and the other to your ear and listen, at the same time. (Ans. 19.)

DR. C. E. UPDEGRAFF (D. Vol. 2, pp. 1081–93) was at the shop between April 18–20, 1875 (Ans. 4), and again with John H. Smith and others, about May 15, 1875 (Ans. 9–11), and thinks he has never been there since. (Ans. 13.) When there in April, 1875, he saw "D" (Ans. 27), which he having been an oculist and aurist (Ans. 68), identifies by the resemblance of the curled magnet to the external part of the human ear (Ans. 4, 7, 27). Drawbaugh talked to him through the instruments and he could hear and understand what was said (Ans. 30). Drawbaugh explained the business uses that could be made of the machines (Ans. 37), and told him they could talk as far as they could use the ordinary telegraph wire (Ans. 35). Witness fixes the date by his book account (Ans. 4, 47).

JOHN H. SMITH (Id. pp. 1093–98) was there with Dr. Updegraff, in May, 1875 (Ans. 3), and was never there before or since (Ans. 12.) He identifies "D" as looking like one of the talking machines that Drawbaugh showed him there that day. (Ans. 4, 8.)

ORLANDO KAHNEY (D. S.-reb. pp. 224–247) while working with Milton Basehore for Wilson Walters, in the summer of 1875, was down at Drawbaugh's shop with

Basehore to grind cradle-scythes for cradling Mr. Walters' oats (Ans. 8, 12, 13, 14) and while there that day Drawbaugh talked to him through the talking machine and he heard and understood what was said (Ans. 8, 9, 10). He described the instrument at which he listened as "round, flat on two sides," with "a hole on one side as a mouthpiece," and as about two inches or two-and-a-half in diameter, (Ans. 23, 25,) and says he held it in his hand and applied it to his ear while listening (Ans. 8, 24). He did his last work for Mr. Walters on Sept. 11, 1875 (Ans. 30-32; and see Basehore, Id. p. 116, and Walters, Id, p. 121, in corroboration of the date). Basehore (Id. pp. 116-121) fully corroborates Mr. Kahney's testimony as to the facts occurring at the shop that day. The oat harvest generally occurs in July, in that part of Pennsylvania (Basehore, Ans. 11), so that the occurrence at the shop must have taken place in June or early in July, 1875.

Jacob B. Fry (D. Vol. 1, pp. 98-106) saw "D" and "E" at Drawbaugh's shop in May or June, 1875, as nearly as he can fix the date, (Ans. 23, 12). He identifies them by their shape and by the curled magnets (Ans. 21, 22, 23). This was while the Axle Co. were in operation there (Ans. 60). One of the instruments was entire like "E," the other had its bottom cover off, like "D." (Ans. 61).

Jacob E. Shettle (Id. pp. 206-25) saw "D" and "E" at the shop "about the year 1875" (Ans. 25).

John H. Stephen (Id. pp. 248-53) saw "D" and "E" there in 1875 (Ans. 17). He states that he remembers the curled magnet on "D" very well.

Jacob S. Shopp (Id. pp. 309-92) saw "D" and "E" there in 1875, the last time that he was ever at Drawbaugh's shop. (Ans. 18–22). He next met Mr. Drawbaugh in Mechanicsburg, in February, 1876 (Ans. 26, 29), when Drawbaugh said he would exhibit at the Centennial if he could raise funds enough to do it, but hadn't the money to go ahead as he would like. (Ans. 27, 28.)

EPHRAIM R. HOLSINGER (Id. 360–374) saw Drawbaugh make the instruments "D" and "E" and remembers experimenting with them about the middle of the summer of 1875. (Ans. 23, 32, 34.) Talked very frequently through "D" and "E" (Ans. 33, 35, 36), and could distinctly hear and understand what was said through them. (Ans. 36.) They could both speak and hear through either of them. Witness moved away from Milltown on November 27, 1876, and has never been there since. (Ans. 6, 9.) This witness assisted Drawbaugh a great deal in his telephone experiments, while living at Milltown from September, 1873 (Ans. 4), to November 27, 1876, and his testimony is very interesting and important on all grounds. Complainants have endorsed him by calling him as their witness also.

HENRY F. DRAWBAUGH (Id., pp. 396–413) began running a line of cars in May, 1876 (Ans. 19), and stopped in the summer of 1878 (Id.) He saw and talked through instrument "D" before he began running the cars, and he thinks the summer before (Ans. 71, 79.) "D" was used both as a transmitter and a receiver (Ans. 80). He thinks it had the bottom cover on at that time (Ans. 96). He identifies it by the curled magnet on the back of it (Ans. 71).

WILLIAM H. BATES (Id., pp. 419–26) saw "D" and "E" in August, 1875 (Ans. 18).

GEORGE L. HALE (Id., pp. 472–77) saw "D" in the fall of 1875. Drawbaugh said it was improvement on his his former instruments (Ans. 16, 31, 32).

Jonathan Balsley (Id. pp. 107-13) lost his wife on Oct. 22, 1875, and immediately afterwards visited friends at Milltown to divert his mind from his troubles. While there was at Drawbaugh's shop and saw an instrument such as "D," a "round piece of wood" with a mouthpiece, and with a curious curled iron at its back. (Ans. 5, 6, 10, 15, 16, 17, 18, 19.) Recollects it distinctly (Ans. 15). Drawbaugh explained that it was a talking machine (Ans. 20.) Saw two such instruments at that time (Ans. 29, 30). Saw other talking machines at the same time, but can identify "D" and "E" better than any others because the curled irons came a little in witness' line of business—he was a blacksmith (Ans. 31, 1). Witness fixes his date by a newspaper paragraph on the death of his wife (Ans. 10) and by reference to her tombstone. (Ans. 28.)

Andrew Evans (D. S-rep. pp. 1-37) saw "D" and "E" at Drawbaugh's shop about December 1, 1875 (Ans. 62-63), and Drawbaugh talked through the talking machine, at that time, to Jacob Evans, who, with several other persons, was present in the shop (Ans. 68, 56). Drawbaugh told them he could talk across the ocean to Europe with these machines (Ans. 69).

Margaret Jane Erb (Id., pp. 47-52) was with her brothers, Andrew and Jacob Evans, and her sister and Jacob Evans' wife, at the time referred to by Andrew Evans, and corroborates his testimony. She, also, identifies "D" and "E" as seen by them that day at the shop. (Ans. 35). Was never in the shop at any other time. (Ans. 24.)

Sarah E. Evans (Id., pp. 55-60), another of the same party, corroborates the facts stated by Andrew and Margaret, and identifies "D" as one of the machines seen by them. (Ans. 28.)

Mary A. Evans (Id., pp. 61–74), wife of Jacob Evans, and one of the party who were with Andrew at the shop about December 1, 1875, corroborates the testimony of Andrew, Margaret and Sarah, and also identifies Exhibit "D." (Ans. 31.)

All these Evans witnesses are corroborated, both as to facts and date, by a great mass of evidence of different kinds and of the most conclusive character, printed in defendants' subrebuttal (pp. 1–95). The visit by Andrew, Sarah and Jane to Jacob and wife was made while Jacob was living in the old rough-plastered house on the hill, which he occupied only from September, 1875, to April 2, 1876. It was also made while Andrew was working for Ambrose Knaub, for whom he never worked except from November 6 till about December 4, 1875. It was also made during the same fall when Underwood's barn was built; and the dates of these several events are fixed beyond all question. Andrew, Margaret and Jane reported the facts, and the remark of Drawbaugh about talking to Europe, on their return home to Dillsburg, York county, Sunday evening, and the family and others bear witness to it.

Daniel B. Condry (D. Vol. 1., pp. 138–43) saw "D" and "E" at Drawbaugh's shop on Christmas day, 1875. (Ans. 8, 4, 5.) Drawbaugh said that he had used them to talk through (Ans. 10), and showed witness how they were to be used. (Ans. 32.)

Isaac B. Millard (Id., pp. 324–34) moved from Harrisburg onto his farm on August 20, 1874 (Ans. 9), and, sometime in 1875, while going back and forth to Mechanicsburg, saw "D" and "E" at Drawbaugh's shop. (Ans. 41, 43, 44.) Witness' last visit to the shop prior to 1880 was sometime before the opening of the

Centennial (Ans. 46-47), and was in cold weather. (Ans. 48.)

John Simmons (D. S-reb. pp. 427-441) was at the shop with Jacob Evans about November, 1875 (Ans. 7, 8, 15), and saw "E" and other talking machines. (Ans. 17.) Had heard of Mr. Drawbaugh's talking machines before that. (Ans. 18, 19.) When there with Evans in the fall of 1875, Drawbaugh talked through the instruments to them. (Ans. 11-15.)

All the above witnesses were examined in the "People's" case. Subsequently, in the Overland case, several others corroborated the priority of these two instruments, D and E.

Abram Marquart (Add. Proofs, pp. 113-120) gives very important evidence, verifying his dates by his books. He was a life insurance agent at Newville, Cumberland county, Pa., thirty miles from Milltown, and is one of the most prominent and reputable citizens of the county. On February 27, 1872, he insured the life of Mrs. Fettrow, of Milltown, and carried the insurance along from year to year until December 1, 1875, when she surrendered her policy and took a paid-up policy instead. (Ans 12, 17.) *His last visit to Milltown was on December 1, 1875.* (Ans. 17.) While visiting Milltown from time to time to see Mrs. Fettrow, between February 27, 1872, and December 1, 1875, he occasionally visited Drawbaugh's shop, hoping to get him to take a policy, which Drawbaugh desired to do, but was too poor to incur the expense. (Ans. 18-32.) His last visit to Drawbaugh's shop was between the 27th day of February, 1875, and the middle of March, 1875 (Ans. 21), which dates he fixes by his life insurance books. (Ans. 7, 23-25, 31, 33, 50-58.) While at Drawbaugh's shop on that occasion he saw Mr. Drawbaugh working on one of these two instruments (Ans. 38–48), and had a conversation with him about it, its features, purposes and principle of operation. In that conversation Drawbaugh told him that it worked by electricity (Ans. 43), could talk at any distance by means of connecting wire (Ans. 44), and spoke about getting it patented, but said he was too poor to have it done. (Ans. 45.) The witness describes the machine from memory (Ans. 38, 39) and recollects the fact that Drawbaugh used the term "curved magnet" in speaking of the permanent magnet at the back end of the machine. (Ans. 38, 41.) The machine was to take the place of telegraphing (Ans. 42), but was to do it by *talking* to a distance (Ans. 44). This is the statement of a man than whom no man stands higher in that county for every characteristic that gives weight to human testimony.

George W. Longnecker (Add. Proofs, pp. 155–160) was at Drawbaugh's shop at some time prior to the Centennial (Ans. 4–7), and saw what were undoubtedly the instruments D and E. He describes them in answers 22–32, so as to leave no reasonable doubt of that fact.

In the Overland Record (Add. Proofs, pp. 36–113, 120, 121), there is also a great mass of evidence corroborating the facts and dates testified to by Dr. C. E. Updegraff and John H. Smith in the People's case.

In the People's case Dr. Updegraff, John H. Smith and Thomas Updegrove (D. Vol. 2, pp. 1081–1102), had testified that Dr. Updegraff and Mr. Updegrove had visited Drawbaugh's shop together in the spring of 1874 and had seen various telephone instruments at that time, including instruments B, C, I; that Dr. Updegraff and one J. M. Boyle had visited the same shop in April, 1875, and had, a few months later, again visited it in company with John H. Smith and a Mr. McGaffick, on which latter two occasions they had seen all the telephone instruments, including F, B, C, I, A and D or E, and talked successfully through some of them. Dr. Updegraff, *who was an aurist*, had his attention attracted to the curved magnet on the back of D or E, *by its curious resemblance to the external human ear*. Smith noticed the curious resemblance of the mouthpiece of one of the instruments (probably A) to the mouthpiece of a bugle. (Ans. 4, 7.) They had a great deal of important conversation at the time with Drawbaugh, all of which should be read in order to appreciate its weight.

At the hearing below in the People's case, the dates fixed by these witnesses for the two latter visits (the spring of 1875, in April, May or June) were vigorously attacked by complainant's counsel, who pointed out two apparent errors, viz.: first, that Zacharias was running Hake's Mill, which they visited on the earlier of these two visits, and Zacharias himself had sworn, early in the case, that he took charge of that mill *in the spring of 1876;* and, secondly, that Smith had testified that on the latter of the two visits he had gone up to *a grocery store* to get some supplies, whereas the grocery store had been blown up on January 19, 1875, and had not been rebuilt till the fall of 1875, and hence, it was argued, the visits could not have been made till after the spring of 1876. Judge Wallace concurred in that view in his findings in the case, although the testimony of Updegraff and Smith was so clear, circumstantial and positive that it ought to have been received with controlling confidence.

Afterwards, the Overland Company, in making up its evidence, investigated the facts anew, and found that the complaimants' objections to the dates fixed by Dr. Updegraff and Smith were themselves founded upon error, and that the dates fixed by said witnesses were correct, and introduced a mass of evidence on the subject which not only did away with the objections urged against these dates, but corroborated the testimony of the witnesses with simply overwhelming force.

First, Hake, the mill owner, was examined, and, producing his lease to Zacharias, conclusively proved that the latter took charge of the mill on or about April 1, 1875, and, therefore, was in charge of the mill when Dr. Updegraff and Mr. Smith visited it a few weeks later. (Add. Proofs, pp. 107–113.)

Secondly, Mrs. Fry, the wife of the grocer who reopened the store in the fall of 1875, was examined (Add. Proofs, pp. 120, 121), and testified that, intermediate between the blowing up and reopening of the store, a Mr. Gardner, the postmaster, kept groceries on sale in one of the front rooms of his house, which he used as a store during that short period.

This testimony answered the objections, but the Overland Company went on and proved by the testimony of *McGaffick* (Add. Proofs, pp. 36–40), *Brenizer* (*Id.* pp. 40–44), *Boyle* (*Id.*, pp. 44–72) *Stackpole* (*Id.*, pp. 72–81), *Irwin* (*Id.*, pp. 81–83), *John H. Updegraff* (*Id.*, pp. 83–90), *Goldsmith* (*Id.*, pp. 91, 92), *Strouse* (*Id.*, pp. 93-97), *Young* (*Id.*, pp. 97–100), and *Weaver* (*Id.*, pp. 100–102), that the visits were in May and June, 1875, and could have been at no other time or times whatever, and that the party, on their return home from these visits, described what they had seen, and were full of enthusiasm about the wonderful talking machines which they had seen.

Among these various witnesses, Mr. Stackpole identified *this very day of the last visit* by an entry in the expense account in his pocket memorandum book (*Id.*, p. 75, entry of "Fishing Excursion," under date of June 21, 1875); and Mr. William B. Irwin, one of the most prominent and reputable citizens of Harrisburg, testified in full to the statements made to him, at the time, about the talking-machines, by Dr. Updegraff and Mr. Boyle, in such way as to leave no room whatever for present doubt as to the correctness of their testimony in the matter. (See Irwin, *Id.*, p. 83, Ans. 21.)

This matter is treated of here at this point because, among the telephones seen and identified by the witnesses in question, Exhibits D and E are very prominent, Dr. Updegraff remembering and testifying to even the form of the permanent magnets on these machines, which he associated at the time with the form of the external human ear.

The attention of the court is particularly called to this chain of testimony. The ingenious attack made upon the dates, and the complete overthrow of the attacking party, is most convincing as to the entire reliability of the testimony. The internal evidence of the correctness and truthfulness of the testimony is very strong, and the minuteness and circumstantiality of the description and statements leave nothing further to be proved.

Here, again, is an array of witnesses, fortified by corroboratory facts, such as precludes all possibility of mistake. Thirty persons besides Daniel Drawbaugh testify to seeing "D" and "E" prior to the filing of Bell's application on February 14, 1876, and of these the majority testify to seeing them prior to June 2, 1875. A large number of these persons talked through the instruments at the time, and clearly heard and understood what was said through them. The witnesses describe the instruments, and distinguish them by size, shape and the peculiar curled permanent magnet at the back. One witness, Updegraff, an aurist, was struck by the curious resemblance of these magnets to the external ear of a human being; another, Balsley, a blacksmith, by the fact that they were a new form of iron such as he, although a smith, had never seen before. Harman K. Drawbaugh, who assisted in making them in January and February, 1875, says he could at any time from that day to this have reproduced them from memory alone. The instruments themselves are extant and in court, and even the complainants' expert is obliged to admit that their articulation to this day is perfect, and that instruments such as these could be put out and successfully used for practical business purposes; while their counsel admit, in their Overland brief that these instruments are highly organized, containing the most refined improvements in use at the present day, and one of the counsel, Mr. Dickerson, in his printed argument in the Overland case, characterized them as follows: "You can put them in a countryman's vest pocket—a pair of perfect magnetos. They embody the inventions of two patents; they contain the invention of Mr. Bell's first patent and of his second patent; they are perfect magnetos." (See Mr. Dickerson's printed arguments, p. 84.)

As to the dates there can be no argument. Vannasdale and Ensminger never were at the shop subsequently to February 3, 1875. Updegraff and Smith were never there after the middle of May, 1875. Sarah A. Evans never was there after that one visit of about December 1, 1875. Holsinger was never there after November, 1876. Harman K. Drawbaugh, Orlando Kahney, Jonathan Balsley, Vannasdale, Ensinger, Augustus Kahney, Daniel Fettrow, Jeremiah Fry, M. M. Grove, Updegraff, Smith, and others fix their dates, in some cases absolutely, and in others with close approximation, by book entries made in their business at the time. There is nothing wanting to render the proofs completely conclusive of every fact which the law requires to establish Drawbaugh's priority of invention.

The very fact that Judge Wallace based his conclusions in part upon an error into which he was led by complainant's skillful counsel, as to the date of the visit of Dr. Updegraff, Smith, Boyle and others, to Drawbaugh's shop, taking it to be after the spring of 1876, when in fact it was in June, 1875, is good reason why his decision should be overruled.

We have now proved the existence of at least four complete sets of telephone instruments at Drawbaugh's shops, besides instrument A, prior to the earliest experiment ever made by Alexander Graham Bell which even he can claim to have been a telephone experiment, viz., the old teacup transmitter and its receiver, instruments "F" and "B," instruments "C" and "I" and instruments "D" and "E"—all these instruments being in existence prior to June 2, 1875; three of them "A," "D" and "E," extant, entire and operative to this day; and four of them, "I," "C," "F" and "B," extant in great part to this day. But we have not yet concluded the overwhelming proofs of Drawbaugh's priority. A large number of witnesses, additional to those whom we have cited, testify to seeing talking machines, or talking through them, at Drawbaugh's shop prior to February 14, 1876, but are unable now to identify the particular instruments so seen or used; and another large class of witnesses testify to having heard of Drawbaugh's talking machines long prior to 1876.

We will now briefly advert to this additional corroborative evidence.

Unidentified telephones at Drawbaugh's shop.

In the Overland case, several witnesses were examined who gave evidence of the strongest character in support of Drawbaugh's claim to priority of invention, but were unable to identify the particular instruments employed. Prominent among these witnesses was HON. RICHARD J. HALDEMAN, member of Congress from the Cumberland, Pa., congressional district, for two successive terms, commencing March 4, 1869, and ending March 4, 1873, and his wife, MARGARETTA C. HALDEMAN (a daughter of ex-Secretary Simon Cameron). (Add. Proofs, pp. 102–107.) When making his first canvass for Congress, in the summer of 1868, Mr. Haldeman visited Drawbaugh's shop and inspected his telephones, and was satisfied from what he saw and what Mr. Drawbaugh told him at the time, that the problem of transmitting speech had been solved. Mrs. Haldeman accompanied him on his second canvass of the district, in the summer of 1870, and testifies that her husband then told her of his former visit, and that the instrument had been operated in his presence. She further testifies that Mr. Drawbaugh's invention was a matter of common talk in the community in the summer of 1870, and that it worked "by electricity," was designed to "carry the voice from one place to another," and "was spoken of as Drawbaugh's talking machine, and an improvement on the telegraph." There can be no mistake about these dates, nor can the truthfulness of such witnesses be questioned for a moment.

In addition to these witnesses, DR. GEORGE W. BOWMAN and his wife, MAGGIE E. BOWMAN (Add. Proofs, pp. 173–179), testified to visiting Drawbaugh's shop on the occasion of the baptism of Mrs. William R. Gorgas, prior to March 14, 1871 (see p. 177, Ans. 6, 7, 8), when Mr. Drawbaugh talked through the instrument to Dr. Bowman, who heard through them what was said, and remembers and repeats some of the words. He again heard the instruments talked through on some subsequent occasion. The date of Dr. Bowman's first conversation over Mr. Drawbaugh's telephones cannot be questioned, nor can the character and standing of both witnesses.

DAVID STEVENSON, JR. (Add. Proofs, pp. 141–155), also testifies to hearing talk over Drawbaugh's telephones before Drawbaugh moved out of the old house by the grist-mill, and therefore before April 1, 1869. He details the particulars as to the location of the instruments at the time, the way the wire was zig-zagged from post to post on the porch to give greater length of line, etc., etc. He is a witness whose character has been thoroughly endorsed by Mr. Storrow, in his argument below in the Peoples' case. (See remarks of Storrow, quoted in full on p. 142, Add. Proofs.)

LEVAN H. ORRIS (Add. Proofs, pp. 121–130) also saw telephones at Drawbaugh's shop and saw persons talking through them, in July, 1873. Drawbaugh tried to interest him in the subject, but his head was full of political matters at that time, and he took no interest in talking-machines.

The character of this witness is savagely attacked because there was an embezzlement in his office, or a shortage in his accounts as county treasurer, in 1876; but the testimony of Woodburn, his competitor for the office in 1873 (and who also saw Drawbaugh's telephones during the same month; Id., pp. 133–138), Wagner, state senator (Id., pp. 138, 139), Eckels, state representative (Id., pp. 139–140) and Graham, state representative (Id., pp. 140–141), shows that his reputation for truth and veracity is very high, and that the witness is held in high esteem in the community, and is regarded as the victim of other people's misdoings.

In addition to these six witnesses examined in the Overland case, a large number of witnesses examined in the People's case, testified to seeing, hearing, or knowing of, telephones at Drawbaugh's shop prior to February 14, 1876, although they are unable to identify the particular instruments.

CYRUS ORRIS (D. Vol. 1, pp. 170, 175) saw Drawbaugh's talking machines at different times from about the 1st of April, 1871, down to 1880 (Ans. 16). Took his son-in-law, Jacob E. Smith, down to Drawbaugh's shop to see the machines about April 1, 1871 (See Smith, Id. pp. 166–7, Ans. 12–20); Orris, pp. 170–1, Ans. 5–14.)

EZEKIEL WORLEY (Id. pp. 253–5), about the year 1873, saw the talking machines at Drawbaugh's shop (Ans. 7–20).

This statement is corroborated by John K. Taylor (Id. p. 634, Ans. 6–10).

N. W. KAHNEY (Id. pp. 275–80) saw the talking machines about 1872 (Ans. 10–20).

William Eppley (Id. pp. 280-83) visited Drawbaugh's shop for the last time in May or June, 1875 (Ans. 4, 5). Was there several times during the two years preceding that period (Ans. 6.), and had seen talking machines (Ans. 7).

Henry Bonholtzer (Id. pp. 384-87) was at Drawbaugh's shop in 1869, and saw talking machines there (Ans. 11, 14, 19, 21).

George H. Bowman (Id. pp. 466-70) saw talking machines in Drawbaugh's shop in February, 1876, at which time somebody was talking to Mr. Drawbaugh through them.

Charles L. Drawbaugh (Id. pp. 501-3) saw and talked through the talking machines at Drawbaugh's shop, a year or more prior to May 1, 1876, and heard and understood what was said through the machines.

David K. Ernst (Id. pp. 516-8) was at Drawbaugh's shop with John B. Bloser about the middle of June, 1872, and talked with Mr. Drawbaugh about the talking-machines, and thinks he saw them at the time (Ans. 4, 5).

This testimony is corroborated by John Bloser, both as to the time and the facts (Id. p. 518).

S. S. Rupp (Id. p. 572) was at Drawbaugh's shop with Mr. Hamacher and his scholars on February 1, 1876, and recollects that Mr. Drawbaugh at that time spoke about a machine that he had which he called a talking machine, but witness was interested in other things and did not pay much attention to it.

David M. Ditlow, (Id. pp. 573-4) saw Drawbaugh's talking machines about 1872, when Mr. Drawbaugh talked through it, and witness heard and understood through the machine what he said.

Mrs. Lydia Drawbaugh (D. Vol. 2, pp. 692-4), saw the talking machine in September, 1872, her sister, Mrs. George Free, being present at the time.

Mrs. Mary Free (Id. pp. 694–6), was with her sister, Mrs. Lydia Drawbaugh, at Daniel Drawbaugh's shop in September, 1872, when Mr. Drawbaugh talked through the machines to them, and she remembers hearing through the machines the words "Good afternoon, ladies!" Drawbaugh told them that the machine operated by electricity.

Jacob Evans (D. S-reb., 88–95), was at Drawbaugh's shop with his wife, his brother, Andrew, and his sisters, Margaret and Sarah, about December 1, 1875, and saw and talked through the talking machines.

Margaret Brenneman (Id. pp. 103–109), saw the talking machines at Drawbaugh's shop in 1869 (Ans. 19, 20).

George Natcher (Id. pp. 141–148), lived at Milltown in 1871, 1872, and never has been in the town since August 9, 1872 (Ans. 3–6). While living there he was at Daniel Drawbaugh's shop and saw and talked through the talking machines (Ans. 8–20). Talked and listened at the same machine (Ans. 14), and understood what was said through it (Ans. 15). The machines were on different floors (Ans. 16–20).

Mrs. B. B. Spangler (Id. pp. 176–178), sister of George Natcher, moved away from Milltown in 1872, and never has been there since (Ans. 3, 4). Talked into Mr. Drawbaugh's talking machines while she lived there (Ans. 6–7). Witness was so small at the time that Harman Drawbaugh had to lift her up to enable her to talk into the machine (Ans. 8, 9).

Henry L. Hamme (Id. pp. 322–328), was at Drawbaugh's shop either in the last of January or the beginning of February, 1876 (Ans. 2, 3), in company with

George Frederick and Jonathan Fry (Ans. 12), and saw and talked through the talking machine at the time (Ans. 17-22); heard and understood very plainly what was said through the machines, even when Mr. Drawbaugh talked in a whisper (Ans. 21-22).

GEORGE FREDERICK (Id. pp. 328-331) was at Drawbaugh's shop with Mr. Hamme and Mr. Fry in January or February, 1876, and saw the talking-machine.

JONATHAN FRY (Id. pp. 331-335) was at Drawbaugh's shop with Mr. Hamme and Mr. Frederick in the winter of 1875-6, and saw the talking-machines there.

WILSON G. FOX, late chief of police of Harrisburg, Pa., (Id. pp. 342-347) saw the talking-machine at Mr. Drawbaugh's shop about the year 1867 or 1868 (Ans. 3-5)—when the old faucet company was in operation there (Ans. 6-8). Prior to March, 1871, witness was employed in the carding room of the Harrisburg Cotton Mill (Ans. 21-3) and Drawbaugh came there to get material to wrap his wire (Ans. 20) which he had intended to use for the talking-machine (Ans. 27).

JACOB BARBER (Id. pp. 371-377) was a candidate for the office of County Commissioner of Cumberland County, in the summer of 1873, and in connection with that political campaign, had occasion to go to Mr. Drawbaugh's shop shortly after the death of George B. Heck. While at Drawbaugh's shop, saw the talking-machine there. (Ans. 13, 14.) Was never in the shop after July or beginning of August 1873 (Ans. 13).

WM. H. MARTIN (Id. pp. 827-836) was at Milltown with John Keefauver to get Mr. George Hosler to make him a pair of boots, while Hosler was living there. Hosler lived at Milltown only from March, 1872, to March, 1873. (See George Hosler's testimony Id. p. 367.) At that time witness and Mr. Keefauver went down to Drawbaugh's shop, and talked through the talking-machine there, from the basement to the attic.

Witness heard and understood what was said through the machines. They talked and listened at the same machines. (Ans. 48.) Had heard about Mr. Drawbaugh's talking-machine in 1869, and 1870. (Ans. 19-21.)

JOHN F. KEEFAUVER (Id. pp. 837-848) corroborates Mr. Martin in every particular, and also states that he talked through Mr. Drawbaugh's talking-machine with Jacob M. Sadler, in April, 1873, prior to the death of George B. Heck (Ans. 40-55) and that about two or three years before he ever saw the talking-machines he had heard a good deal about them (Ans. 34, 35), and first heard of them at a place seven miles west of Carlisle (Ans. 37, 38).

ABRAHAM DITLOW (Id. 876, 890) knew of Drawbaugh's talking-machine in 1874 (Ans. 11) and saw it and talked through it at that time (Ans. 36-39); had forgotten the fact, but was reminded of it by Mr. Alexander Milner of Porter County, Indiana, (Ans. 43-45) whom witness told about it in May or June, 1876, in Indiana. (See Alexander Milner, Id. p. 513, Ans. 5; C. B. Clifford, Id. p. 515, Ans. 8).

BENJAMIN K. GOODYEAR (Id. pp. 1011-1020) a lawyer and formerly under-sheriff of Cumberland County, Pennsylvania, testifies that, in 1871, witness seized the personal property of George W. Kissinger, of Milltown, upon an execution issued November 13, 1871, and returned "unsatisfied," December 4, 1871. On December 4, 1871, the attached property was appraised by J. B. Drawbaugh George B. Heck and Daniel Hart, appraisers, and was found to be less than the amount exempted by law.

A copy of the record of all these proceedings is printed on pp. 1012, 1015.

On December 4, 1871, the day of the appraisement, witness went to the workshop of Daniel Drawbaugh to find J. B. Drawbaugh, in order to summon him as an appraiser (Ans. 9, 10), and had to wait for him a short time at Daniel Drawbaugh's shop (Ans. 12). While waiting there Daniel Drawbaugh showed him his talking machines and talked through them to him, and witness heard him speak and understood distinctly the words that he spoke through the instrument (Ans. 12-15). Witness has never been in Daniel Drawbaugh's shop since, so far as he can recollect (Ans. 11), and never levied any other execution upon the goods and chattels of George W. Kissinger, at Milltown, since December 4, 1871.

ABRAHAM MAY (Id. pp. 1028-1037) did a job of work on Daniel Hart's house at Milltown in August and September, 1870, of which he produces his account-books (Ans. 8-13). Never did any work for Daniel Hart after that (Ans. 14). While doing that work for Daniel Hart, was down at Drawbaugh's shop to get a boring-machine mended which he was using in the work at Mr. Hart's house, and Daniel Drawbaugh showed him his talking-machines, and talked through them from one floor of the shop to another (Ans. 24-30). Witness understood and heard through the machines the words that Mr. Drawbaugh spoke into it, (Ans. 31-33.)

Witness' testimony is corroborated by Jacob H. Kilmore (Id. p. 1037), Wm. H. Martin (Id. p. 827) and John A. Smith (Id. p. 1114).

WM. W. SNYDER (Id. pp. 1066-1082) was at Drawbaugh's shop on Wednesday, February 5, 1873, and saw the talking machines (Ans. 23-39). Witness verifies the date by an entry in his diary (Ans. 26).

Here, again, it is impossible that there could be any error as to the dates. Prominent citizens, such as Barber and Goodyear, identified the time absolutely by the public business which they were engaged upon and which called them to the shop. The Natcher family fix it by the fact that they never were in Milltown after they moved away on August 9, 1872. Others, such as Orris, S. S. Rupp, Hamme, Frederick, Fry, Fox, Martin, Keefauver, May and Snyder, fix it by book entries, or facts concerning the date of which there can be no question. And very many of the witnesses were never at the shop after the beginning of the year 1875.

Witnesses who heard of Drawbaugh's telephones.

One further class of witnesses remain to be considered in this connection.

A great many herein above cited as having talked through, or seen, Mr. Drawbaugh's talking machines prior to February 14, 1876, testify that they *heard of* said machines before they ever saw them. In addition to these, more than fifty other witnesses testify to having heard of Drawbaugh's talking machines prior to February 14, 1876.

Springer (D. Vol. 1, pp. 182–8, Ans. 59, 60), heard of them as early as 1875 or before; *Strong* (Id., p. 375), in November, 1875; *Hiler* (Id., p. 382), in 1869; *Byers*, a telegraph operator for the Western Union Telegraph Company, at Newville (Id., p. 509), about 1873 to 1875; *Geo. Bricker, Sr.* (Id., p. 510), in the fall of 1870; *Henry Snyder* (Id., p. 513), about 1872 or 1873; *Z. Bowman* (Id., p. 612), in 1871 or 1872, when Drawbaugh's child was a mere skeleton; *David Evans* (D.

S-reb., p. 52), *Ambrose Knaub* (Id., p. 38), *Elizabeth Evans* (Id., p. 75), *Moses Evans* (Id., p. 78), and *Mrs. E. Rentzel* (Id., p. 83), all about December 1, 1875; *Mrs. Mary A. Evans* (Id., p. 61), in 1872, before her father's death, which happened in February, 1873—she heard *her father* speak of it; *J. M. Brenneman* (Id., p. 114) in 1873, at Highspire; *M. H. Natcher* (Id., p. 135), one of the complainants' witnesses, prior to August 9, 1872; *William Natcher*, another of complainants' witnesses (Id., p. 149), prior to August 9, 1872, when he removed from Milltown with his family; *Miley* (Id., p. 170), in 1873–5; *Mrs. E. Natcher* (Id., p. 174), prior to August 9, 1872; *John Sprenkle* (Id., p. 281), prior to June 30, 1873—(for fixing the date, compare his answer, 12, with Gen. Diven's testimony, (Id. p. 77); *Crone* (Id., p. 338), from spring of 1874 to spring of 1875; *J. A. Sprenkle* (Id., p. 364), about 1871 or 1872; *L. J. Klein* (Id., p. 377), in December, 1871,—before the death of Henry Rupp; *S. H. Bates* (Id., p. 380), at Bridgeport, from 1869 all along to 1876; *E. Ditlow* (Id. p. 389), prior to his father's death on Feb. 21, 1873; *Danner* (Id. p. 402), before March, 1873, and frequently from March to November, 1873; *Blair* (Id. p. 410), all along from 1866 to 1876; *G. A. Spangler* (Id. p. 462), from 1868 to 1871; *Harris*, from April, 1874, to March, 1876; *Reed*, station agent of Pennsaylvania R. R. Co., at Wheeler, Indiana (Id. p. 476), in May or June, 1870, *at Wheeler, Indiana*, from Joseph Ditlow, and fixes date by his account books; *Mrs. I. Hardesty*, of Wheeler, Indiana (Id. p. 483), in Sept., 1874, at Wheeler; *Salome Hardesty* (Id. p. 489), in Sept., 1874, at Wheeler; *Harman Hardesty* (Id. p. 493), in September, 1874, at Wheeler; *Hamlin Hardesty* (Id. p. 509), in September, 1874, at Wheeler; *Mrs. Kate Young* (Id. p.

536), about 1870; *William Young*, husband of Kate (Id. p. 539), about 1871; *Mrs. Reynolds* (Id. 612), in summer of 1874, from Edward Nichols, while he was working at Drawbaugh's shop for the Haucks; *Chambers* (Id. p. 671), as early as August, 1874, at Newville; *Hackett* (Id. p. 690), from spring of 1874 to fall of 1874; *Mrs. L. H. Nichols* (Id. p. 731), in summer of 1874; *B. F. Zimmerman* (Id. p. 822), all along from 1868 to 1873; *Mrs. M. Swigert* (Id. p. 869), in 1874; *Magonell* (Id. p. 963), before November 3, 1873—about 1871; *Skeibley* (Id. p. 1020), in 1873 or 1874; *Egolf* (Id. p. 1023), in latter part of 1872; *J. H. Kilmore* (Id. p. 1037), in 1869—1870; *George S. Bricker* (Id. p. 1083), in September, 1869, and told the surveyors, Spafford and McHenry, who were appointed by Act of Legislature, commissioners to adjust the boundaries of Clinton county, Pa., a hundred and sixty miles distant from Milltown; *Spafford* (Id. p. 1089), one of said commissioners, who was never at Milltown, but heard of Drawbaugh's talking machine from Bricker in October, 1869, while adjusting the Clinton county line; *McHenry* (Id. p. 1092), the other commissioner who, also, was never at Milltown, but heard of Drawbaugh's talking machine at the same time with Spafford; *William North* (Id. p. 1102), prior to July 25, 1870; *S. A. North* (Id. p. 1105), prior to July 25, 1870; *Woods* (Id. p. 1107), in the fall of 1869; *Rev. J. H. Young* (Id., p. 1112), in 1875; *J. A. Smith* (Id., p. 1114), from the spring of 1872 all along to the spring of 1876; *Dale* (Id., p. 1119), at Carlisle, prior to 1875; *Gher* (Id., p. 321), from 1873 to 1875, "eight or ten years" prior to testifying; *George Martin* (Id., p. 307), in 1874; *Burgner* (Id., p. 1137), prior to April 1, 1869; and *G. W. Hunter* (Add Proofs, p. 172).

This latter class of witnesses serve to fix the dates of Drawbaugh's talking machines, often in the most striking and conclusive manner. Take, for example, the testimony of Spafford, McHenry and Bricker, who adjusted the Clinton county line; they were proceeding under an Act of the Pennsylvania Legislature, of April 3, 1869, printed on p. 1089, defendants' surrebutting record; and they filed their report of the completed adjustment in the Court of Common Pleas in Clinton County, on November 1, 1869, as appears by a certified copy of the record, printed on pp. 248, 249, defendants' evidence in surrejoinder. The knowledge of Mr. Drawbaugh's talking machine was communicated to the two commissioners and others when all were together engaged on that survey. They never saw each other after that survey was completed, until they met in Harrisburg to testify in this case. (Bricker, p. 1086, Ans. 19, 22; Spafford, p. 1090, Ans. 11; McHenry, p. 1093, Ans. 5, 8.) Spafford and McHenry got their information in 1869 from Bricker, who had gotten his information from Henry F. Drawbaugh, at Newville. (Bricker, p. 1083, Ans. 5; p. 1085, Ans. 13; Spafford, Ans. 13; McHenry, Ans. 9.) Spafford and McHenry are persons of high standing in the community, as appears from their being personally named in the Act of April 3, 1869, as commissioners for so important a work. They were evidently satisfactory to the people of both Clinton and Potter counties, as proper persons for the adjustment of disputed questions between the two counties.

Again, the witnesses from Wheeler, Indiana, fix their dates in the most conclusive manner from account books, railroad books, &c., &c. Reed, the railroad station agent there, testifies that all of them are persons of the highest standing in the community. (Reed, p. 482, Ans. 27, 28, 29.)

So, also, the Evans party, including Mr. Knaub and Mrs. Rentzel, cannot be mistaken as to their date. And the same remark is true of many of this class of witnesses, who heard of the talking machines at a time when they do not remember to have seen them, or who certainly did not see them. Persons who died long prior to February 14, 1876, are shown to have been talking through, or talking about Mr. Drawbaugh's telephones; as, for example, Michael S. Drawbaugh, who died March 16, 1871 (D. S-reb., p. 1098, Ans. 7, 8); Henry Rupp, who died in the latter part of January, 1872 (Id. p. 378, Ans. 4); Abraham Ditlow, senior, who died February 21, 1873 (Id. p. 61, Ans. 4); and George B. Heck, who died July 9, 1873 (Id. p. 893, Ans. 10).

Upon reviewing the whole of the evidence hereinabove commented upon, it appears that *two hundred and twenty persons testify to knowledge of Mr. Drawbaugh's speaking telephone prior to February 14, 1876!* Of these *one hundred and forty-one actually saw the instruments,* and the majority of them identify the particular machines which they saw; and *about seventy heard talk through the machines or were present when others were successfully talking through them.* The great majority of these witnesses testify to facts occurring prior to June 2, 1875, and therefore anticipating Bell's first alleged telephone experiments.

When we come to consider the history of Drawbaugh's telephones subsequently to February 14, 1876, it will be seen that the above evidence is corroborated by a strong array of additional testimony. It will be shown that, about that date, and from time to time thereafter, down to 1879, new telephones appeared in Mr. Drawbaugh's shop, of greatly improved form and construction, far in advance of all improvements made by other inventors. And even the complainants will be compelled to contribute a portion of the corroborating evidence.

Drawbaugh's Telephones were Electric Machines.

That Mr. Drawbaugh's talking machines, in existence and successful working operation prior to Alexander Graham Bell's invention, were *electric* instruments, has already been shown; but the evidence on that point has by no means been exhausted. It may be briefly condensed as follows:

1. Three of the instruments, "A," "D" and "E," are still in existence, to speak for themselves. Of four others, "I," "C," "F" and "B," such original parts are still extant as to show conclusively their electric character and their general plan and mode of operation.

2. The testimony of Daniel Drawbaugh is positive and explicit, that they were electric speaking telephones, always used with a closed circuit, and without breaking the current—some of them being battery-telephones, and some magneto-telephones.

3. The distances to which Drawbaugh was in the habit of asserting the power of his instruments to talk, and his repeated statements that the invention would supersede the telegraph, show conclusively that electricity was the medium of operation. Among his many statements on this subject, before the date of Bell's invention, were the following:—

"It was the greatest invention ever known,"—"if he had the means to go on with it, he said they could talk, or rather be a time to come as to talk, to the old country same as we can talk here." (*Shank*, D. Vol. 1, pp. 23-4, Ans. 45.) "He could run it out for miles, and parties could talk in at one end and be heard at the other end, the same as persons in a room together;" "It would eventually take the place of telegraphs" (*Zacharias*, Id. pp. 49-50, Ans. 28, 29). "It would supply the place of the telegraph." "He gave me as an illustration the distance between Harrisburg and Philadelphia—that parties at that distance could communicate as if they were speaking together;" "there would hardly be any limits;" it was "an instrument to convey the voice to supply the place of the telegraph." (*Smith*, Id. p. 68, Ans. 16). "From here to California" (*Smyser*, Id. p. 76, Ans. 22). "It would do away with a great deal of telegraphing" (*Waggoner*, Id. pp. 123-4, Ans. 21). Can talk "as far as the wire goes" (*Fry*, Id. p. 145, Ans. 18). "Said he could hear a man talking from that place to New Cumberland or Harrisburg, and understand distinctly what he said" (*Carl*, Id. p. 159, Ans. 14). "Better and handier than the telegraph—that you could just talk through it in place of writing" (*Sherich*, Id. p. 177, Ans. 9). "He says, by attaching two wires, you can hear it away off: the telegraph is nowhere with it" (*Balsley*, Id. p. 193, Ans. 15). "He said he could be heard a great many miles, but the miles I disremember" (*E. Z. Good*, Id. p. 200, Ans. 32). "He told me he could talk the same for miles as he could for a short distance" (*Kahney*, Id. p. 204, Ans. 42). "He said, at the same time if he had a wire from the shop in connection with the telegraph wires at White Hill, that he could talk to Mechanicsburg, by having a machine there, or an instrument in the office; he also said that it would be better than telegraphing, and that it would be worth a great deal of money" (*Shettel*, Id. p. 206, Ans. 4). "He thought he could make it that he could talk through it to Harrisburg;" "He thought they would take the place of telegraphing" (*Renéker*, Id. p. 239; Ans. 48, 49). "Beats all the others of my inventions:" "he said he could carry sound as far as Shiremanstown, or rather talk as far as Shiremanstown" (*Weber*, Id. p. 245, Ans. 5½, 247, Ans. 25). "Convey the voice or sound to a great distance" (*Shireman*, Id. p. 260, Ans. 14). "He said that he would be able to operate, that a man preaching in New York, that a congregation in Philadelphia would hear the same sermon" (*Hawn*. Id. p. 267-8, Ans. 18). "He said it could be made that you could talk to New York" (*Darr*, Id. p. 273, Ans. 22). "He said he could just as easy speak ten miles as one, or any distance he would choose to" (*Kahney*, Id. p. 276, Ans. 19). "He said the time would come that you could speak to San Francisco." "He thought the talking machine would take the place of the telegraph" (*Hamacher*, Id. p. 290, Ans. 17). "He said it was worked by electricity; would take the place of the telegraph, and that he could make it so that he could talk to San Francisco." (*J. F. Rupp*, who was there with Hamacher, Id., p. 314, Ans. 48.) "He told me he was going to make a machine to talk from Harrisburg to Philadelphia, and he said it would be a cheaper and quicker way than telegraphing." (*Musser*, Id., p. 316, Ans. 17.) "Said he believed they could talk for a hundred miles." (*Smith*, Id., p. 337-8, Ans. 42.) "He said I could speak ten, fifteen or twenty miles, or even to California if there was a wire extended." (*Fetrow*, Id., p. 349-50, Ans. 23.) "He said he could stand here at White Hill and talk to his brother, the 'Squire, at Mechanicsburg, quite handily." (*Hiler*, Id., p. 382-3, Ans. 17.) "He said he could attach a wire to it and talk for ten miles"—"as far as he could have a circuit around." (*Wisler*, Id., p. 394, Ans. 17.) "He said he could talk across the continent." (*H. F. Drawbaugh*, Id., p. 406, Ans. 71.) "He said it could be heard hundreds of miles"—"would supersede the telegraph." (*Zimmerman*, Id., p. 416, Ans., 19, 21.) "He said, as far as wire could be magnetized"—"that there was no limit to the distance to which it could be done—that you could send it as far as you could put wires." (*Holsinger*, Id., p. 365, Ans. 47, 48.) "He said they could be used the same as a telegraph wire for a distance." (*Bates*, Id., p. 420, Ans. 14.) "It would take the place of telegraphing. I laughed at him at the idea of that, and he said, 'Rupp, you will see that it will.'" (*D. Rupp*, Id., p. 430, Ans., 34.) "Would do away with telegraphing." (*Hale*, Id., p. 473-4, Ans. 9.) "Mr. Drawbaugh said that the talking machine could be used to talk at a long distance—'from Philadelphia to California' are the very words that he used." (*Free*, Id., p. 489, Cross-Ans. 44.) "He spoke as if it could be used a thousand miles"—"it would take the place of the telegraph"—"he said that he had tested it and that he could hear distinctly—the distance of the length of Mechanicsburg was the distance he gave—just as distinctly as though a person was talking in a room." (*Landis*, Id., 631-2, Ans. 5, 7, 4.) "You could hear it to Pittsburg." (*Grove*, Id., p. 662, Ans. 1.) "That now he has invented something that would take the place of the telegraph." (*Herr*, D. Vol. 2, p. 668, Ans. 5.) "He told us then that he could talk hundreds of miles through that." (*Lenig*, D. Vol. 2, p. 699, Ans. 3). "Instead of using the old mode of telegraphing, he could talk directly through the wire"—"he thought he could talk as far as you could use the ordinary telegraph wire." (*Updegraff*, D. Vol. 2, p. 1082–3, Ans. 4; p. 1087, Ans. 35). "It was intended to convey sound from Philadelphia to New York or Baltimore, or quite a long distance." (*Smith*, D. Vol. 2, p. 1094–5, Ans. 3). "He said he thought it was, or would be, one of the greatest inventions of the age; and would take the place of telegraphing." (*Draper*, D. Vol. 2, p. 1126, Ans. 15). "He said, 'I can take this machine and talk clean out to Europe across the ocean.'" (*A. Evans*, D. S-reb. p. 8, Ans. 69; *Mrs. Erb*, Id. p. 50, Ans. 34; *D. Evans*, Id. p. 54, Ans. 22; *S. E. Evans*, Id. p. 57, Ans. 29; *M. A. Evans*, Id. p. 65, Ans. 45; *E. Evans*, Id. p. 77, Ans. 17; *M. Evans*, Id. p. 82, Ans. 26; *E. Rentzel*, Id. p. 84, Ans. 18; *Jacob Evans*, Id. p. 90, Ans. 23). "He believed he could talk to people in New York City, and even further." (*Zearing*, D. S-reb. p. 127, Ans. 41). "If he could only get some one to help him, once, he would run it to Harrisburg and convince them, and then he would run it from Harrisburg to Philadelphia." (*Eicholz*, D. S-reb. p. 154, Ans. 18). "He said it would take the place of the telegraph." (*Graybill*, D. S-reb. p. 187, Ans. 23). "He said it was for the purpose of talking between distant points, as, for example, between Eberly's Mills and Harrisburg, which, I think, he used as an illustration." (*Schrader*, D. S-reb. p. 471, Ans. 13). "He made the remark that he could converse as far as Carlisle"—"it was intended to surpass the present telegraph system." (*W. W. Snyder*, D. S-reb. p. 1073, Ans. 34).

4. Mr. Drawbaugh always explained his talking machines as operating by electricity. "He said it works by

electricity." (*Shank*, D. Vol. I, p. 24, Ans. 46). "Operated by electricity—he told me." (*Brooks*, Id. p. 42, Ans. 8). "I was under no other impression than that it was by electricity." (*Smith*, Id., p. 68, Ans. 18.) He told me "it was operated by electricity." (*Smyser*, Id., p. 76, Ans. 21.) He explains "that the sound was conducted by electricity." (*Nichols*, Id., p. 91, Ans. 22.) He said the instruments were "to convey sound by electricity." (*C. Eberly*, Id., p. 114-5, Ans. 16.) "He would operate it by electricity." (*Yetter*, Id., p. 137, Ans. 21.) *Condry* thinks he said they were operated by electricity. (Id., p. 139, Ans. 11.) *Stephen* says Drawbaugh explained them as operating by electricity. (Id., p. 249, Ans. 9.) "I was told it operated by a battery and electricity." (*Shoop*, Id., p. 256, Ans. 7.) "He said they operated by magnetism." (*Shireman*, Id., p. 260, Ans. 12.) "He said they would be operated on by a battery." (*Hawn*, Id., p. 267, Ans. 17.) "He said that the machine was operated by electricity—by a battery." (*N. W. Kahney*, Id., p. 277, Ans., 27.) "He said they were to convey words by means of electricity." (*Hamacher*, Id., p, 290, Ans. 16.) "It was worked by electricity." (*Rupp*, Id., p. 330, Ans. 61.) "He told me it would go by electricity." (*Musser*, Id., p. 316, Ans. 18.) "He told me that it was done by means of electricity." *Millard*, Id., p. 330, Ans. 60.) They talked on "*a circuit*." (*Wisler*, Id., p. 394, Ans. 17.) "He said it was electricity that would pass it over the wires—that it would carry the sound right along." (*Zimmerman*, Id., p. 416, Ans. 20.) He said they were operated "by electricity." (*Bates*, Id., p. 420, Ans. 13.) "It was driven by a magnet." (*Hale*, Id., p. 476, Cross-Ans. 30.) "My recollection is distinct as to its conveying sounds by electricity." (*Bricker*, Id., p. 510–1, Ans. 1.) Drawbaugh said they were operated "by electricity." (*Kohler*, Id., p. 545, Ans. 22.) "The sound could be carried to a distance on a wire by the use of electricity." (*H. K. Drawbaugh*, Id., p. 550, Ans. 3.) "By electricity or something of that kind." (*Taylor*, Id., p. 634, Ans. 9.) He said it operated "by electricity." (*Fisher*, D. Vol. 2, p. 689, Ans. 9.) "He said it was by electricity." (*Mrs. Free*, D. Vol. 2, p. 695, Ans. 14.) He told us of the use of electricity in connection with it. (*Lenig*, D. Vol. 2, p. 699, Ans. 2). The talking machines were operated by electricity (*Updegraff*, D. Vol. 2, p. 1088, Ans. 40). Drawbaugh told me at the time that the talking machine was operated by electricity (*Sutton*, Id. p. 1106, Ans. 21). "He could talk by electricity" (*R. B. Sutton*, Id., p. 1108, Ans. 9). He explained that they were operated by electricity (*Draper*, Id., p. 1128, Ans. 28). "He said it was worked by electricity" (*A. Evans*, D. S–reb., p. 8, Ans. 70). In connection with the talking machine, Drawbaugh "spoke of applying both magnetism and electricity." (*Prof. Heiges*, D. S–reb., p. 100, Ans. 39.) "He said 'This is done by electricity.'" (*Hamme*, Id., p. 324 Ans. 24.) "As far as I can remember, they said you could talk through it from one house to another—I don't just know how, but some way by electricity." (*Mrs. Swigert*, Id., p. 870, Ans. 7.) "He said it was to operate by electricity." (*Fox*, Id., p. 344, Ans. 18.) "He then told me of his talking machine, which he said was also done by electricity, over wires." (*Goodyear*, Id., p. 1016, Ans. 14.) "Electric talking machine, as he called it." (*William North*, Id., p. 1103, Ans. 5.) "He got to talking about an electric clock, and about a talking machine that would work by electricity." (*S. A. North*, Id., p. 1106, Ans. 14.) "It was to be an electric machine, used in place of telegraphing." (*Woods*, Id., p. 1108, Ans. 1215.) "I remember distinctly of hearing of an electric clock and an electric talking machine which he had invented." (*Young*, Id., 1113, Ans. 11.)

All the witnesses in the Overland case who testified to the Drawbaugh instruments tell the same story as to their electrical character. *Strickler* (Add. Proofs, p. 233) testifies (Ans. 29) even to the way in which the current was generated "in this instance," *i. e.* by magneto-electric, or inductive, action, implying that, in other instances, the other form of current (voltaic) was used. See also testimony of Mr. and Mrs. Haldeman, Marquart, Longnecker, the Stevensons, the Gregorys, Woodburn, Orris, Emrick, Boyle and his corroborating witnesses, etc., etc.

5. Witnesses all along, from 1867 to February 14, 1876, in addition to identifying the very talking machines, which they saw or operated, testify that they saw various electrical appliances connected with them, such as batteries, permanent magnets, electro-magnets, armatures, wrapped wires, circuit wires, wires hanging loose, binding-posts, "two wires," high and low conductors, insulated wire. In D. Vol. 1——

Shank testifies (p. 21) that they were connected by two wrapped wires (Ans. 17-20; also p. 22, Ans. 34, 35). *Brooks*, p. 42, says the same (Ans. 14). *Zacharias* corroborates the same fact (p. 49, Ans. 21). *Smyser* (Ans. 14, 15) testifies to the same. *U. R. Nichols* (p. 91, Ans. 25, 26) says Drawbaugh connected the two wires to the binding-post of the instrument "A" in witness' presence in order to talk through it. *J. B. Fry* (p. 100, Ans. 33-36) says they were connected by two wires. *Carl* says they were connected by wrapped wire (p. 159, Ans. 10).

J. E. Smith (p. 167, Ans. 24) testifies that wrapped wires were used to connect the instruments. *Balsley* (p. 193, Ans. 15) corroborates the same fact. So, also, *Kahney*, (p. 204, Ans. 44.) *Shettel* (pp. 206–7, Ans. 4, 5) testifies to the two wires, the electro-magnets, the armature—"bar of iron that was attached to the bladder"—batteries, &c., &c., and describes the size and arrangement of the parts. *S. Nichols* testifies to the two wires and other electrical appliances used on the machines (p. 229, Ans. 17–21, &c.) *Weber* (p. 245–6, Ans. 7) says it was wire wrapped like an old-fashioned bonnet wire. *Stephen* (p. 249, Ans. 9–13) saw coils and batteries attached to them. *Shireman* (pp. 261–2, Ans. 32, 33) saw the wrapped wire extending along the ceiling, &c., and connecting the instruments; and the coils of white wrapped wire—which white covering was probably the same that Drawbaugh procured from Fox at the Harrisburg cotton mill in 1870 or 1871, as testified to by Fox, (D. S–reb., pp. 344–45, Ans. 18–27.) *Musser* (D. Vol. 1, pp. 316–7, Ans. 19) states that Drawbaugh told him about the high and low conductors, and tried to explain them to him. *J. C. Smith* (Id. pp. 336–7, Ans. 26, 27, 41, &c.) saw the two copper wires connecting the instruments, and running along the ceiling and down through the floors, and was told about the high and low conductors, non-conductors, &c. *Holsinger*, (pp. 366–7, Ans. 56–58), who was never at Drawbaugh's shop after November 27, 1876, saw Drawbaugh preparing hard carbon compositions to be used in his talking machines, and remembers the fact of his discussing or explaining the different ways of using the conductors. He also remembers the armature—a little sheet of soft iron—attached to the vibrating substance or diaphragm. *Zimmerman* (Id., p. 416, Ans.

22) remembers that Drawbaugh explained the construction of the electro-magnets and the necessity of insulating their wires. *D. Rupp* (Id. p. 428, Ans. 15, 16), speaks of the wires connecting the instruments, the curled magnets, the magnet on instrument C, the battery—tumblers under the table. *Geistweit* (pp. 459-60, Ans. 15, 20) describes how the wires, wrapped with colored thread, ran from place to place in the shop, connecting the instruments. *Bowman* (pp. 467-8, Ans. 22-24) describes the wires connecting the instruments—how they ran—the batteries, etc. *Hale* (p. 474, Ans. 10-18, first deposition, and p. 665-6, Ans. 1-3, second deposition), testifies to the electro-magnet and permanent magnet on "C," the electro-magnet of "B," the copper wires, the size of the magnets, the color of the insulating material, etc., etc. *Free* (p. 486, Ans. 20-25) testifies to two wires and a battery being used with the machines. *Kohler* (pp. 545-6, Ans. 23-26) saw the wires and battery connected to the talking machine.

Hon. R. J. Haldeman saw the wrapped wires in 1868, extending out of the window to some station outside—"the string, I believe, enveloped a metallic wire." (Add. Proofs, p. 104, Ans. 16.) *Mrs. Haldeman* (Id. p. 107) testifies to their electric character. So, also, all the other Overland witnesses.

In the People's case:—

H. K. Drawbaugh (pp. 550-71) testifies very fully to the electrical character of these machines, including the use of two wires, long lines of wire stretched back and forth in the attic and connected to the instruments, experiments with plumbago and other low conductors, electro-magnets, permanent magnets, armatures, batteries, etc., etc. (See Ans. 6, 9, 21, 23, 31, 77-79, 82-100, 105, 131.) *Herr* (D. Vol. 2, p. 669, Ans. 14, 15) saw the slack wires connected to the talking machines and running out of the shop; also (Ans. 16) the permanent magnet on "C." *Updegraff* (Id. p. 1082, Ans. 4) saw the wire running out of the shop from the talking machines; the peculiar-shaped magnets (Id); the helix, and other magnets (Ans. 24, 25); the machines were changed around during the talking—"he took them off the wires—detached them and put on others" (Cross-Ans. 83). *Smith* (Id. pp. 1095-6, Ans. 4-10) describes various electrical parts belonging to the machines, such as magnets, spools, etc., etc. *Sutton* (p. 1105-6, Ans. 16, 17) refers to the magnets, electro-magnets, batteries, etc., which he saw belonging to the talking machines.

SCHRADER (D. S.-reb., p. 470, Ans. 15, 17) describes the armature of "B," the size of the electro-magnets, etc. *Vannasdale* (Id., p. 792, Ans. 31) describes the arrangement of the permanent magnet right up against the electro-magnet, on C, when he saw it February 3, 1875. Other witnesses refer to various electrical parts of the machines identified by them, and testify that such parts were on the machines when they saw them, from time to time, at Drawbaugh's shop, long prior to Bell's invention; but we do not deem it worth while to fill up the brief with references to such testimony, as the facts are, in effect, included in their recognition and identification of the instruments themselves. *We would, however, in this connection, call especial attention to the fact that all Mr. Drawbaugh's volunteer assistants, through all these years—Harman K. Drawbaugh, George W. Drawbaugh, Henry F. Drawbaugh, Holsinger, Springer, John C. Smith and Emanuel K. Gregory*—testify unanimously to the electrical character of the work.

It is therefore conclusively established, so far as human testimony can establish any fact, that, on the morning of June 2, 1875, Alexander Graham Bell and Daniel Drawbaugh stood relatively as follows: Mr. Bell had discovered nothing and invented nothing; he was ignorant even of the fact that the mechanical vibration of an armature in front of the pole of an electro-magnet would cause any audible effects at the other end of the line. He was not an electrician, and was groping for general information as to the character and effects of the electric current under different conditions; he suspected the possibility of electrically transmitting speech, but had no idea of the means for accomplishing it.

At that same moment Mr. Drawbaugh had in his shop at Milltown, at least seven electric telephone instruments—transmitters and receivers, battery and magneto telephones—through some of which he had been successfully transmitting speech for years, and all of which were open to the inspection and trial of any person who chose to visit his shop. If Mr. Bell had visited Drawbaugh's shop that day, he could have held a conversation back and forth over an electric speaking telephone line, as perfectly and as easily as to-day. And these facts, so far as Drawbaugh's telephones are concerned, were known at that time to whole communities—not to a few interested persons, but to hundreds of witnesses, scattered over a wide territory, and some of them living in distant counties and even in different states.

And that these prior telephones of Drawbaugh contained all the inventions claimed in the two patents set up by the complainants in this suit, is equally well established.

1. The machines are here in court to speak for themselves.

2. The defendants' experts, Mr. Park Benjamin and Prof. Barker, testify to their complete anticipation of both of the Bell patents.

3. The fact of their ability to transmit and reproduce articulate speech audibly, is of itself, on the complainants' own theory and according to all their expert testimony, including that of Mr. Bell, himself, conclusive evidence of their anticipating his inventions.

4. The complainants' expert, Mr. Pope, agrees with Mr. Park Benjamin as to their anticipating the inventions claimed in the Bell patents. His testimony is so unhesitating and positive, that we here append a portion of it, (C. Vol. 2, pp. 1419–1422) as follows:

"Cross-Q. 267. What mechanical part essential to a telephone receiver, do you find in Bell's instrument illustrated in Fig. 7 of his patent of March 7, 1876, that you do not find in Drawbaugh's instrument, 'Reproduced B?'

"Ans. Nothing; I regard the two receivers as substantially alike.

"Cross-Q. 268. What mechanical part essential to a telephone transmitter do you find illustrated in Fig. 7 of Bell's said patent that you do not find in Drawbaugh's instrument 'Reproduced B?'

"Ans. No essential part, but in answering this I assume that a source of electricity must be used in connection with each to constitute it a transmitter. The instruments themselves are substantially the same.

"Cross-Q. 269. A continuous electric circuit, including a battery and two of Drawbaugh's 'Reproduced B' instruments would present substantially the same contrivance and arrangement as is shown in Fig. 7, of Bell's patent of March 7, 1876; would it not?

"Ans. It would.

"Cross-Q. 270. What mechanical part essential to a telephone transmitter or a telephone receiver, do you find represented in Fig. 7 of Bell's said patent that is not contained in Drawbaugh's reproduced instruments 'C and I?'

"Ans. Assuming 'C' and 'I' to be coupled together in a continuous circuit, there appears to be nothing essential contained in Fig. 7 of the patent that is not fouud substantially in instruments 'C reproduced' and 'I reproduced.'

"Cross-Q. 271. Answer the same question, assuming a continuous circuit with Drawbaugh's instrument 'C reproduced' and his instrument 'A' in the line.-

"Ans. I make the same reply to this question, with the understanding that a battery is placed in the continuous circuit with the Drawbaugh instruments.

"Cross-Q. 272. Answer the same question, assuming a continuous circuit with a battery and with Drawbaugh's instrument 'I reproduced' and his instrument 'A' in the line.

"Ans. The same answer is also applicable to this couple.

"Cross-Q. 273. Answer the same question, with Drawbaugh's instrument 'B reproduced' and his instrument 'F' in a continuous circuit with a battery.

"Ans. The same answer is also applicable to this couple.

"Cross-Q. 274. Answer the same question, with Drawbaugh's instrument 'B reproduced' and his instrument 'D' in a continuous circuit with a battery.

"Ans. Assuming 'D' to be in a working condition, which it was not when I saw it, I again repeat the answer with reference to this couple.

"Cross-Q. 275. Answer the same question, with Drawbaugh's instrument 'C reproduced' and his instrument 'E,' in a continuous circuit with a battery.

"Ans. I again repeat the same as to this couple.

"Cross-Q. 276. Answer the same question, assuming Drawbaugh's instrument 'I reproduced' and his instrument 'E' in a continuous circuit with a battery?

"Ans. I repeat the same answer as to this couple.

"Cross-Q. 277. Answer the same question, assuming Drawbaugh's instrument 'C reproduced' and his instrument 'D' in a continuous circuit with a battery?

"Ans. I repeat the same answer, on the assumption, as before, that 'D' is in working order.

"Cross-Q. 278. Answer the same question, assuming

Drawbaugh's instrument 'I reproduced' and his instrument 'D' in a continuous circuit with a battery?

"Ans. I repeat my answer, which is the same as to the preceding question.

"Cross-Q. 279. Answer the same question, assuming Drawbaugh's instruments 'D' and 'E' in a continuous circuit with a battery?

"Ans. My answer is the same as to question 277."

(Recess until 3 P. M.)

"Cross-Q. 280. Answer the same question, assuming a continuous circuit with a battery with Drawbaugh's instruments 'A' and 'reproduced B' in line?

"Ans. I find no mechanical part essential to a telephone transmitter or telephone receiver represented in Fig. 7 of Bell's patent that is not contained in the instruments referred to in question, assuming, as before, that they are placed in a continuous circuit with a battery.

"Cross-Q. 281. Answer the same question, assuming Drawbaugh's 'reproduced B' and 'reproduced C,' in a continuous circuit with a battery?

"Ans. I repeat my last answer as to this couple.

"Cross-Q. 282. Answer the same question, assuming Drawbaugh's 'reproduced B' and 'reproduced I' in a continuous circuit with a battery?

"Ans. I repeat my answer to question 280 as to this couple.

"Cross-Q. 283. Answer the same question, assuming a couple of Drawbaugh's instruments 'reproduced C,' in a continuous circuit with a battery?

"Ans. I repeat my answer to question 280 as to this couple.

"Cross-Q. 284. Answer the same question, assuming a couple of Drawbaugh's instruments 'reproduced I,' in a continuous circuit with a battery?

"Ans. I repeat my answer to question 280 as to this couple.

"Cross-Q. 285. Answer the same question, assuming a couple of Drawbaugh's instruments 'E,' in a continuous circuit with a battery?

"Ans. I repeat my answer to question 280 as to this couple.

"Cross-Q. 286. Answer the same question, assuming Drawbaugh's instruments 'A' and 'E,' in a continuous circuit with a battery?

"Ans. I repeat my answer to question 280 as to this couple.

"Cross-Q. 287. Answer the same question, assuming Drawbaugh's instruments 'A' and 'D,' in a continuous circuit with a battery.

"Ans. I repeat my answer to question 280, as to this couple, assuming 'D' to be in its original uninjured condition.

"Cross-Q. 288. Answer the same question, assuming a couple of Drawbaugh's instruments 'D' in a continous circuit with a battery?

"Ans. I repeat my answer to question 280, as to this couple, assuming 'D' to be in its original uninjured condition.

"Cross-Q. 289. In a speaking telephone line, it is not necessary to have a battery in the line, provided the electromagnet of the transmitting instrument is polarized by a permanent magnet, is it?

"Ans. It is difficult to get any results without a battery, unless the transmitting and receiving instruments are both polarized. The results are, at least, very inferior, and I should rather say that the battery is necessary, unless both magnets are polarized.

"Cross-Q. 290. In Drawbaugh's instruments 'D,' 'E,' 'Reproduced C' and 'Reproduced I,' the electro-magnets are polarized by a permanent magnet, are they not?

"Ans. They are.

"Cross-Q. 291. Suppose we should couple those instruments together in a continuous circuit without a battery in any of the following couplets, to wit: C and D; C and E; C and I; D and E; D and I; E and I; or should use a pair of the same instruments as C and C; D and D; E and E; or I and I; what part essential to a speaking telephone transmitter or receiver do you find represented in Fig. 7 of Bell's patent of March 7, 1876, that you would not find contained in each of said couplets?

"Ans. Every part essential to a speaking telephone transmitter or receiver, which is represented in Fig. 7, of the patent, is represented by a corresponding part in each of the couples enumerated in the question. The construction is not precisely the same, nor are the proportions similar in many cases. And the source of electricity, which in the patent is a battery, is replaced by a permanent magnet in each of the couples."

PART II.

SUBSEQUENT TO FEB. 14, 1876.

The history of Mr. Drawbaugh's operations and achievements prior to Feb. 14, 1876, is strongly corroborated by evidence covering the period from Feb. 14, 1876, to the beginning of this suit, and which we will now very briefly review. From this additional evidence two important facts clearly appear, to wit:—*first*, that the same instruments which we have shown to have been in existence at his shop prior to the year 1876, continued to be seen there from that time to the present; and, *secondly*, that new and very highly organized and improved telephone instruments made their appearance there from time to time, 1876, and from that year to the present.

And, *first*, as to the old machines being seen there in 1876 and subsequent years:—*J. Fry* saw talking machines there in 1876, (D. Vol. 1, p. 145, Ans. 23). *Springer* lived at Milltown from April 1, 1876, to January 7, 1877 (Id. p. 182, Ans. 3), and never has been in Drawbaugh's shop since he moved away (p. 188, Ans. 61). While there he saw "B," "F," "D," "E," (Ans. 7), "C" (Ans. 30) and other new machines. *Reneker*, (Id. p. 237, Cross-Ans. 44) testifies that he saw "B" and "F" there every year since 1875. *Stephens*, (Id. p. 250, Ans. 16) is "certain" that he saw "C" there in 1876. He is corroborated by complainants' witness, *George Row* (C. Vol. 2, p. 1533), who testifies to Stephens' telling him about Drawbaugh's talking machines immediately after returning from the shop in October, 1876. *N. W. Kahney*, (D. Vol. 1, pp. 277–8, Ans. 32–48) testifies to seeing and talking through "A" as a receiver, in 1876. *H. B. Musser*, (Id. pp. 317–8, Ans. 20–34) talked through "D" on June 28, 1876. His date is corroborated by the books of the Axle Co. (see Moore, Id. p. 623, Ans. 33). *Henry F. Drawbaugh* (Id. p. 407, Ans. 77, 79) saw and talked through "D" before commencing to run the cars. He began running the cars in May, 1876 (p. 398, Ans. 19). *W. S. Dellinger* (Id. p. 440, Ans. 13) saw "E" and "B" in March, 1876, also saw "A" and "C," but cannot fix the time. *Geistweit* (Id. p. 460, Ans. 24, 25) was never at Drawbaugh's shop after the fall of 1876; saw "D" or "E," or both, there prior to that time. (Ans. 26.) *George H. Bowman* (Id. p. 466) saw and talked through machines there in February, 1876 (Ans. 4, 5, 6, &c.), but does not identify the instruments. Witness never was there again before the commencement of this suit. (Ans. 26.) Harman K. Drawbaugh saw "F" there in the fall and winter of 1876 (Id. p. 569, Ans. 150). *D. B. Musser* (p. 608, Ans. 8–14) saw "D" there in 1876, in the summer. *Wilson N. Miller* testifies that he was employed at the warehouse at White Hill railroad station from January, 1876, to June, 1876 (Ans. 14–16, Id. p. 644), and was railroad station agent there from June, 1876, to April, 1878 (p. 644, Ans. 13). Drawbaugh was living at Mechanicsburg from April 1, 1876, to April 1, 1877, and had to take the cars at White Hill station to go from his shop to his home. One *evening* (Ans. 20) in the *summer*

(Ans. 30) as Drawbaugh was about to take the train while living at Mechanicsburg (Ans. 20)—and hence in the summer of 1876—Drawbaugh had a talking machine with him and showed it to the witness (Ans. 20) and wanted witness to put up a line and equip it with the talking machines, for use from witness' railroad office to the store of witness' father at Shiremanstown, in and about the business of witness and his father. (Ans. 22–30.) Witness neglected the matter, but kept Drawbaugh under the impression that he would try to make the necessary arrangements for putting up the line; and Drawbaugh spoke to him several times about it (Ans. 26), and probably saw, after awhile, that witness did not mean to do anything about it. Witness describes the instrument which Drawbaugh showed him, at that time, as *a small wooden box about five or six inches across and about an inch and a half thick*, with a tube to it (mouthpiece) to talk in, *which clearly identifies the instrument as Exhibit "A."* *Jeffries* (D. Vol. 2, pp. 679–684), was at Drawbaugh's shop, by invitation about a week after the presidential election of November, 1876 (Ans. 5), and again after that and before Christmas, 1876 (Ans. 12, 13, 14). On his first visit there he saw talking machines (Ans. 6–11) which he identifies as "C," "B," "F," "A," "H," and small round instruments like "D" and "E" having wrapped wire connected with them (Ans. 21, 22, 29). The instruments then looked as if they had been made some time; "B," "C" and "F" looked old and worn with handling. (Ans. 31, 30.) *Uhrich* (D. S.-reb. p. 219, 220), was at the shop about 1876 (Ans. 2) and never was there before or after (Ans. 7); while there he saw the talking machine instruments similar to "M" and "D" (Ans. 8–11); *Dunlap* (Id. pp. 581–583), was at Drawbaugh's shop in August, 1876 (Ans. 6, 7), and was never there but that once (Ans. 5). While there he saw instruments "H" and "B." (Ans. 30). His date is positively fixed by *Chambers* (Id. pp. 671–679). *D. Cowan* (Id. pp. 701–704), was at the shop with Kissinger in the spring of 1876, before the Centennial and saw and talked through the talking-machines, but does not identify the particular instruments. He never was in the shop before nor since. (Ans. 38–59.) Complainants' witnessess, *Shapley* (C. Vol. 1, pp. 589, 599, Ans. 22–30), and *Landis* (Id. pp. 607–609, Ans. 13, 23, 28, 31), saw "B" at Drawbaugh's shop on October 3, 1876. Drawbaugh said it "was to revolutionize the world, or words to that effect" (Landis, p. 609, Ans. 28). *Drawbaugh said he had had it up around the shop* (Shapley, Ans. 26) *and they had spoken with it.* (Ans. 28.) Complainants tried to make it appear that Shapley had shown Drawbaugh a *Scientific American* containing a description of a telephone (Shapley, Question 79) but on cross-examination (Ans. 118–127), it was admitted by Shapley that he showed this article to Drawbaugh *after October 3, 1876*, and hence, after seeing Drawbaugh's telephone, Michael Dellinger (D. Vol. 1, p. 538) was at Drawbaugh's shop in November, 1877 (Ans. 1, 2), and never there before or since (Ans. 11). While there he saw "A," "D," "H," and other machines not identified. (Ans. 4–10.) *Henry Dellinger* (Id., 539–41) was there in the fore part of June, 1877 (Ans. 7–11), and was never there after 1877 (Ans. 18). While there he saw "F," "B," and many other talking machines. (Ans. 12–17.) *John Dellinger* (Id., pp. 542–3) was there with his brother Henry in June, 1877 (Ans. 1–5), and saw "B," "M," "H," and other talking machines (Ans. 7–30). Witness was never there after that visit (Ans. 13). *H. N. Shoop* (Id., pp. 255–9) moved to Milltown in February, 1877, and moved away in November, 1877 (Ans. 12) and never was in Mr. Drawbaugh's shop since. (Ans. 25.) While living there saw "D" at the shop (Ans. 16, 47). *Matthias* (Id., pp. 547–9) was first at the shop in 1877, toward fall (Ans. 4) and saw and talked through the talking machines (Ans. 5), among which he identified "E" and others. (Ans. 10–46). Was there again in 1878, and saw talking machines. (Ans. 14, 15.) *Kimmel* (D. S.-reb., p. 180) saw talking machines there in 1876 or 1877, which he does not identify. (Ans. 6–11.) *Augustus Kahney* (Id., pp. 254–266) was there in 1877 (Cross-Ans. 56) and saw talking machines there (Ans. 5–29). *F. F. Landis*, Master Mechanic of the Geiser Mfg. Co., of Waynesboro, Pa., was there in November, 1878; and saw talking machines "D" and "H." (Ans. 15–25.) *J. Fry* (D. Vol. 1, p. 145, Ans. 25) saw talking machines there in 1878. *William S. Dellinger* (Id., pp. 439–57) saw them all along from March, 1876, to 1881. *Levi A. Bowen* saw "D" and "E" there in Sept., 1878. (D. Vol. 1, p. 462–3. Ans. 3–5). Drawbaugh said he had others (Ans. 10, 16), but witness did not see them (Ans. 9). *Fry* (Id., p. 145, Ans. 26) saw them there in 1879. *Chellis* (Id., p. 528, Ans. 24) saw "B," "F," "A," "D," "E," "C," "I," and others there in the latter part of 1878 and early part of 1879. Witnesses who were often at the shop from 1875 to 1880, such as Shettel, Dr. Moffitt, George W. Drawbaugh, Henry F. Drawbaugh, Harman K. Drawbaugh, W. S. Dellinger, Daniel Fettrow, and many others, say that along during that time, they saw many different talking machines there, the precise dates of which they are unable to identify. Many of the complainants' witnesses, in addition to Shapley, I. D. Landis and Row, above cited, corroborate these facts. *Mosser* (C. Vol. 1, pp. 366–369) saw "B" at Drawbaugh's shop (Ans. 17), at least as early as Jan., 1878 (Ans. 3, 4). *Theodore Grissinger*, a most prejudiced witness, was never at the shop after the clock company discontinued operations in the spring of 1879 (C. Vol. 1, p. 531, Ans. 194), but is obliged to admit seeing "A" (Ans. 177), "D and E" (Ans. 37, 128, 134, 152), and that he saw "D" there frequently (Ans. 138). *Holsinger* was called by complainants (C. Vol. 2, pp. 1210) and in answer 24, p. 1218, was made to substantially repeat his former deposition given in behalf of defendants. *Matthews* (C. Vol. 1, pp. 540–551) was at the shop in the spring of 1878, about May 1st (Ans. 7), and saw instruments which he imperfectly remembers, but which were evidently telephones, and possibly "D" and "E." (Ans. 14, 33, 35, 36, 37). When witness asked Drawbaugh about the telephone, he reached to a bench or shelf and took these instruments and showed him—it required no time nor effort to get them. (Ans. 53, 55.) Witness "paid very little attention to them." (Ans. 37.) *A. Ditlow* (C. Vol. 1, pp. 967, 968) was never in Pennsylvania after March 19, 1877 (Ans. 6), but heard of Drawbaugh's talking machines before he left for the west on that day. (Ans. 16.) *J. Ditlow* (C. Vol. 1, pp. 959–961) heard of them before he went west on March 19, 1877. (Ans. 7, 31, 36.) *J. Evans* (C. Vol. 1, p. 984) heard of them frequently as early as 1877. (Ans. 83.) *Kahney* (C. Vol. 1, pp. 994, 995) heard of them soon after the Centennial. (Ans. 48–59.) *C. A. Landis* (C. Vol. 2, p. 1070) saw "B" and "F" there between March 31 and April 13, 1877

(Ans. 7–9.) *A. L. Rupp* (C. Vol. 2, pp. 1113, 1114) saw and talked through talking machines there in the winter of 1877–8. (Ans, 18, 19, 23–34.) *Geo. C. Rupp* (C. Vol, 2, pp. 1123, 1124) saw and talked through talking machines there in the winter of '77–'78 (Ans. 16–21); cannot say whether it was before or after Christmas, 1877 (28); and identified "A" as looking like the instrument at which he listened. (Ans. 22.) *Jacob May* (C. Vol. 2, pp. 1565, 1566) saw "A" (Ans. 25) and probably "F" (Ans. 28) when there in, probably, 1878. *Henry S. Rupp* (C. Vol. 2, pp. 1128–1160) saw and talked through an instrument at Drawbaugh's shop (Ans. 59) probably "B" (see Ans. 62, 63) and thinks this must have been in 1877 (Ans. 59, 60, 61). It was probably, however, in 1871 or '72 instead of 1877, as we judge from the following facts, viz.: 1st. That "B" was used instead of the later and better instruments. 2d. That witness fixes the time as when he was getting some pipes fixed (Ans. 60) but got pipes fixed there in 1871 or '72 (Ans. 130). 3d. When he saw the telephone there the electric clocks were only the two old, crude, unfinished structures (Ans. 144, 145, 146, 153) and were quite a recent invention of Drawbaugh's (Ans. 154–155); and, 4th. That the occurrence was so very long ago as to have entirely faded from the witness' memory, and only been recalled through the efforts of complainants' counsel just before going on the witness stand (Ans. 172).

Secondly. As to new and highly organized and improved telephones making their appearance at Drawbaugh's shop after "D" and "E" were made in January and February, 1875, and from time to time from that date to 1880.

Five of these new instruments appeared before September 1, 1876, viz.: "L," "M," "G," "O" and "H." Of these five instruments "L" and "M" were made first, "G" and "O" next, and "H" last. (Drawbaugh, D. Vol. 2, p. 800, Ans. 293-297). Drawbaugh is unable to give the exact dates when these instruments were made, but the date of "H" is clearly established by the other evidence, and that approximately fixes the dates of "L," "M," "G" and "O."

Of these instruments "L" and "M" were originally made in the form represented in Exhibit reproduced L drawing and Exhibit reproduced M drawing, shown on p. 18 of defendants' book of drawings. (Drawbaugh, D. Vol. 2, p. 804, Ans. 309.) They then each combined a carbon transmitter with a receiver in one and the same instrument—a result never before accomplished. Afterwards their hard carbons were removed and permanent magnets substituted, thus rendering them magneto-telephones. (Ans. 310.) In this form they are filed in evidence as Exhibits "L" and "M," and are represented by the drawings on p. 17 of defendants' book of drawings. They are described by Mr. Drawbaugh on pp. 801-5 (D. Vol. 2), by Knight (Id. pp. 721-6), and by Park Benjamin (Id. pp. 1198-1200). The change from the combination of carbon transmitter and receiver to the magneto form, in these instruments, was made after the production of instrument "H." (Drawbaugh, p. 805, Ans. 315.) Instruments "G" and "O" are in evidence, are illustrated on pp. 7 and 20 of defendants' book of drawings, and are described by Mr. Drawbaugh (D. Vol. 2, pp. 806-7), by Knight (Id. pp. 720-21), and by Park Benjamin (Id. pp. 1195-8). "O" was originally the same as "G," but was afterwards slightly modified in respect to the means of connecting the carbons to the diaphragm (Drawbaugh, near middle of p. 807). They are both carbon transmitters, employing *hard carbon blocks or balls* instead of the pulverized carbon before used in instrument F. Instrument "H," a very complete and highly organized carbon transmitter, with hard carbon blocks, is in evidence as Exhibit H; is represented on pp. 9, 10, 11 of defendants' book of drawings, and is described by Drawbaugh (D. Vol. 2, pp. 795-7), by Knight (Id. pp. 719-20), and by Park Benjamin (Id. pp. 1200-1). Only very slight changes have been made in it, such as using a thicker diaphragm and using a steel spring instead of a brass spring. (Drawbaugh, Ans. 277-281, p. 798.) A call bell was attached to it a short time after it was made—possibly some months after. (Id. Ans. 278.)

THE DATE OF INSTRUMENT H.

The date of instrument "H" is positively fixed by *William P. Chambers* (D. S.-reb., pp. 671-679); *George W. Dunlap* (Id. pp. 581-589), and others, as prior to September 1, 1876. *Dunlap* testifies (Ans. 5) that he never was in Drawbaugh's shop but once, that that visit was in August, 1876 (Ans. 6, 7), and that he then saw talking machines there (Ans. 28, 30), one of which he distinctly remembers and clearly describes as "a black-walnut box, eight or ten inches high, about five in width, *with an inclined front* with a mouthpiece *on the front side*, (Ans. 29) and he recognizes "H" as being like the machine (Ans 30). Soon after that visit, he told W. P. Chambers about what he had seen (Ans. 49), and Chambers went down to see it, about two weeks after witness' visit to the shop. (Ans. 58). After Chambers had seen it, he and witness talked it over (Ans. 59, 60). *Chambers* testifies that on September 5, 6, 7 and 8, 1876, he was at the Centennial with the Hope Fire Company, of Harrisburg (Ans. 9, 10), which date is also fixed by the books of the Fire Co., (see Etla, Id. pp. 589, 590); that he never was at Milltown but once in his life (Ans. 11), which was just one week before going to the Centennial with the Hope Fire Company (Ans. 13, 14), and was in the last week of August, 1876 (Ans. 12). Dunlap had told him of Drawbaugh's wonderful talking machines before that (Ans. 19, 20), and witness went to Milltown from curiosity to see the talking machine (Ans. 26). He saw the machine there, and describes it as follows, (Ans. 26):—"The part which I saw resembles a cornet-box that I had with me at the time. It was made of walnut. My cornet-case was thirteen inches long and eight inches wide and three and a half inches high. *I set the case on the work-bench beside the machine, and remarked to Dan that it would make a good cornet-case, the only difference being the inclined face-board.* The talking machine, as it was called then, *had a bell on the top and a mouthpiece in the center of the inclined face.* I remember distinctly of him telling me that I could play a cornet solo in Newville and he would have the benefit of it at the mill—that is, play into the machine. Just while I was there he *opened the face*, and I remember of seeing *in the right-hand corner* what I supposed to be *a small tin can with wires attached.* When he was about to explain to me the use of it, there was a man came into the shop, and asked Dan whether he had his clock done yet. As I understood, he was fixing a twenty-four hour clock for the man, and had promised to have it done for three weeks—had had it on hand for three weeks. That called him away from the machine, and that was the last I saw of it. It spoiled my interest." Witness then identified "H" as the machine which he saw there that day (Ans. 47), and upon opening the door of the instrument, identified the *induction-coil* as the "tin can with wires attached," which he had seen in the same position in the instrument in August, 1876. (Ans. 49.) He also recognized the "circle" (diaphragm and its attachments), which he had seen on the inner face of the door of the instrument in 1876 (Ans. 49), and the binding-posts on the exterior of the box. (Ans. 51). This witness is a well-known citizen of Harrisburg, and a man of the highest character.

In view of the testimony of Dunlap and Chambers, there can be no possible doubt that instrument "H" existed in Drawbaugh's shop as early as the last of August, 1876, in substantially its present condition. *Ira D. Kahney* (D. Vol. 1, pp. 202–3, Ans. 22–24) saw it there soon after his return from the centennial.

Henry F. Drawbaugh (Id., pp. 406–7) saw it there (Ans. 71) while running the cars (Ans. 73), and thinks it was during the first year of his running the cars (Ans. 73), which would fix it as in 1876 (Ans. 19). Daniel Drawbaugh, while living at Mechanicsburg (pp. 413–4, Ans. 3), came to witness' car and asked witness to get him some plumbago, but when witness returned he found that Daniel had already obtained some, and saw him working with it in the shop (same Ans.). Daniel was putting the plumbago in this machine, "H" (p. 412, Ans. 117). Witness identifies the extremely light and delicate spring carbon-holder of "H" (same Ans.). The fact that Daniel was living at Mechanicsburg fixes the time as between April 1, 1876, and April 1, 1877 (D. Drawbaugh, Vol. 2, p. 749, Ans. 3). *W. H. Bates* (D. Vol. 1, p. 419) was never in Drawbaugh's shop after the fall of 1877 (Ans. 4, 44), but saw "H" there in the summer or fall of 1876 (Ans. 19, 20, 67, 69), immediately after some conversation between him and Drawbaugh about the Centennial, which was then in progress. *Geistweit* (Id., pp. 460-1) was never at Drawbaugh's shop after the fall of 1876 (Ans. 24, 25), but, while there, saw a talking machine instrument resembling Exhibit "H" (Ans. 30-33). *Dr. J. W. Moffitt* (Id., p. 496, Ans. 16) saw "H" at the shop, with a great many other talking machines, between the years 1873 and 1880, but is unable to fix the date when he first saw this instrument. *Michael Dellinger* (Id., p. 538, Ans. 2, 4, 5) saw it there in November, 1877. Was never there afterwards. (Ans. 11.) *Henry Dellinger* (Id., pp. 539-40, Ans. 7, 12, 13) saw it there early in June, 1877. Was never there after 1877. (Ans. 18.) *John Dellinger* (Id., p. 542, Ans. 1-7) saw it there in June, 1877. Was never there after that visit (Ans. 13). *Shettel* (Id., pp. 206-25) saw it there early in the spring of 1877 (Ans. 14, 15, 16, 17, 18), the year before the Clock Company business was started (Ans. 19); the bell was then on it (Ans. 20); the instrument appeared to be in the same condition as now. (Ans. 139.) *Matthias* (Id., p. 547-8) saw and talked through it in 1877, in warm weather, towards fall, using "H" as a transmitter and "E" as a receiver (Ans. 4-12). *Musser* (Id., pp. 608-9, Ans. 15) saw it in 1878. *Harman K. Drawbaugh* (Id., pp. 556-7, Ans. 53, 55) recollects his uncles' working on "H" prior to the latter part of October, 1876. *Jefferies* (D. Vol. 2, pp. 678-84) was first at Drawbaugh's shop in 1876, about a week after the November election (Ans. 1-5); saw talking machines there at that time

(Ans. 6–11): was there again that fall, before Christmas (Ans. 12–16); saw "H" there in the fall of 1876 (Ans. 21); observed and commented at the time on the "coffin-hinges" of its door (Ans. 23, 24—witness was a carpenter, and his attention was attracted by something pertaining to his own line of business); the bell was on the instrument at that time (Ans. 25); the instrument was in a firm position against the wall, and was evidently fastened there for use (Ans. 26); Drawbaugh rang the bell, and explained how to speak into the mouthpiece on the front door (same answer); it was connected with wires, one of which ran down through the floor (Ans 27). *John T. Smith* (D. Vol. 2, pp. 684–7) was never at Drawbaugh's shop after 1876 (Ans. 4), and his last visit there was in the week in which "Pennsylvania day at the Centennial occurred" (Ans. 5, 6); was at the shop about three times prior to that—four times in all (Ans. 7); saw "H" there, and thinks it was before his last visit (Ans. 8, 9); it was lying on the table or bench, with the lid open, and machinery inside, and had the bell on top (Ans. 10, 11). Drawbaugh explained that the bell was to give the alarm when he was ready to throw sound through (Ans. 12). "*Pennsylvania day at the Centennial" was September 28th, 1876*, (See Examiners' certificate, top of p. 749, D. Vol. 2). *F. F. Landis* (D. S.-reb., pp. 899, 900, Ans. 15–25), saw "H" in November, 1877: the date is fixed by a letter printed on pp. 902, 903, the visit being within a week after the date of the letter (Ans. 31–35). "H" was then fastened up against the wall of the room (Ans. 15, 17, 21, 42), in plain sight (Ans. 46). It "was a wooden box, ten or twelve inches high, and from six to eight inches wide, with a mouthpiece or funnel-shaped hole, resembling the mouthpiece or hole in the small instrument that he spoke through " (Ans. 20). *John C. Smith* (D. Vol. 1, p. 339), also saw "H" fastened up against the wall (Ans. 55), and talked through it (Ans. 56); saw it before he saw "J" (Ans. 58); but is uncertain whether he first saw it before or after his father moved away in the fall of 1878 (Ans. 54, 47), although he knows he saw it afterwards (Ans. 54).

DATES OF DRAWBAUGH'S TELEPHONES, "L," "M," "G," "O."

The date of the instrument "H" being fixed, therefore, at least as early as August, 1876, it follows from Drawbaugh's testimony, above cited, that the dates of "L," "M," "G" and "O," were at different times along from February, 1875, to August, 1876. Of these four instruments, "L" and "M," unlike the instruments heretofore commented upon, have no distinguishing external feature by which the ordinary casual observer would be likely to remember and identify them from other talking machines, and hence Drawbaugh's testimony must be mainly relied on for their dates. *Holsinger* (D. Vol. 1, pp. 360–75), who was never at the shop after November 27, 1876 (Ans. 9,) saw their magnets, which are of a peculiar shape, a short time before he moved away (Ans. 37, 38), but is doubtful whether he ever saw their boxes, and whether he ever saw "G and O" (Ans. 37, 39). *Springer* (Id. pp. 182, 191), who lived at Milltown from April 1, 1876, to January 6 or 7, 1877 (Ans. 3), and has never been in Drawbaugh's shop since (Ans. 61), saw "G and O" about October, 1876 (Ans. 25, 7), and talked through them (Ans. 26, 27), but, although he was there a great deal while he lived in Milltown, did not see Drawbaugh making these instruments (Ans. 28), which would indicate that they were made prior to April 1, 1876. *Henry Dellinger* (Id., p. 540), saw "L and G" early in June, 1877; *John Dellinger* saw "M" in June, 1877 (Id. p. 542); *Henry F. Drawbaugh* and *Dr. Moffit* saw "L" and "M," "G" and "O," but can fix no date; *Matthias* (Id., p. 548), saw "G" and "O" in the summer of 1877, towards fall; *W. S. Dellinger* (Id., p. 441, Ans. 21, 22), saw "G" and "O" in 1877, and the fact that his brothers were with him at the time (Ans. 123–126) fixes it as early in June, 1877; and *Harman K. Drawbaugh* (Id., p. 557, Ans. 55) saw "O" while on the freight line, between October, 1876, and September, 1877. (Ans. 53, 59.)

The defendants made no special effort to cumulate testimony to fix the date of the machines "G," "O," "L," "M," for the reasons that these machines are somewhat difficult to accurately identify, and are inconsequential in view of the evidence as to the other prior instruments and their successful use.

Dates of Drawbaugh's Telephones, "J," "N," and "P."

After the five machines, "G," "O," "L," "M" and "H," came three other telephones, all in evidence, and marked J, N and P, respectively. Of these, "J" and "N" came first and "P" last (D. Drawbaugh, D. Vol. 2, Ans. 342, p. 814, Ans. 350, p. 818), it being uncertain whether "J" or "N" was the earliest. "J" is a very highly organized carbon-transmitter, made on the general plan of the instrument "H" which preceded it, but having a sort of multiple action; no changes have been made in it (Ans. 334). It is referred to by Drawbaugh (Id., pp. 808–13), Knight (Id., p. 736, 742) and Park Benjamin (Id., p. 1202) and is illustrated on pp. 14, 15, 16 of defendants' book of drawings. In making it Mr. Drawbaugh was assisted by his nephew, *George W. Drawbaugh* (p. 808, Ans. 328), who testified (D. Vol. 1, p. 603, Ans. 63–66) that it was made in 1878 between spring and fall. *Daniel Drawbaugh* testifies (D. Vol. 1, p. 813), that it was made in 1877 or 1878, but he cannot fix the exact time (Ans. 335–337). The works were first made and the case afterwards (Ans. 339), the former by Daniel Drawbaugh, the latter afterwards by George (George Drawbaugh, D. Vol. 1, pp. 600-1, Ans. 40, 41, 42). It was seen at the shop in 1879 by *Smyser*, *I. D. Kahney*, *Chas. L. Free*, and *Jefferies*. It was tested on the Bell telephone line at Stees' office in May, 1878 (Stees, Add. Proofs, pp. 209–220; Johnson, Id., pp. 198-209), and is probably the instrument referred to in the article published in the Mechanicsburg Independent Journal of April 17, 1878. (Compl'ts' Vol. IV, p. 330.)

The instrument "P" was made by Daniel and George Drawbaugh in 1878 (George Drawbaugh, D. Vol. 1, p. 600, Ans. 35, 36), some months after Exhibit "J." (Daniel Drawbaugh, D. Vol. 2, p. 814, Ans. 343); Daniel making the works, and George the case (Id., Ans. 341; George Drawbaugh, D. Vol. 1, p. 600, Ans. 36). It was seen and talked through by *Clendennin* in November, 1878 (D. Vol. 1, p. 522), which fixes its date as early as the fall of 1878, and the date of "J" as at least several months prior to that time. It was also seen and talked through by *Kline* in the spring of 1879 (D. Vol. 1, p. 628).

It is a very highly organized machine, capable of being used as a carbon transmitter, a receiver and a magneto telephone; and is described by Daniel Drawbaugh (D. Vol. 2, pp. 814–17), Knight (Id., pp. 728–35) and Park Benjamin (Id., p. 1203), and illustrated in defendants' book of drawings (pp. 21, 22, 23, 24, 25.)

Instrument "N," described by Drawbaugh (D. Vol. 2, pp. 817–20), by Knight (Id., pp. 735–7), by Park Benjamin (Id., p. 1204), and illustrated on page 19 of defendants' book of drawings, was a small magneto telephone, with a permanently polarized steel diaphragm (Drawbaugh, Ans. 358), which, however, was not the first steel diaphragm used by him, as he had before employed diaphragms of steel on L or M (Id. Ans. 360). This instrument was produced in 1877 or 1878, and is, therefore, inconsequential in this suit, so far as concerns any direct bearing on the Bell patents, although it was made before Exhibit P (Drawbaugh, Ans. 350). It closely resembles "E," "L" and "M" in external appearance, and was probably mistaken for "E" by J. F. Smith, who thinks he saw it in 1876. (D. Vol. 2, p. 686.) It was seen by *Steigelman* on Aug. 8th, 1878 (D. Vol. 1, pp. 609–611), by *Reeser* on the same day (Id., p. 611), and by *H. F. Drawbaugh* and *Dr. Moffit*, who fix no date for it. Two incomplete instruments, Q and K, are in evidence, but were made probably in 1879, and are of no materiality in the case. (See D. Drawbaugh, D. Vol. 2, pp. 820–3.)

Drawbaugh's relations to the "Blake Transmitter."

Complainant's counsel, in their presentations of these cases in the courts below, have savagely attacked the dates of Drawbaugh's transmitters, "H" and "J," arguing that they are mere copies of the "Blake Transmitter," and that, therefore, they *must* have been produced after Drawbaugh had knowledge of the latter instrument.

A few plain, clearly-proven facts will conclusively answer this unfair argument.

First. They are *not* copies of the Blake Transmitter, although quite similar in general principles.

Second. The Blake Transmitter was not *patented* till November 29, 1881, more than a year after this suit was begun (Add. Proofs, p. 313).

Third. It was not *introduced into use in Pennsylvania* till the spring of 1880, a few months before this suit was begun. (Add. Proofs, test'y. of Johnson, Ans. 59, 60, p. 203; test'y. of Stees, p. 210, Ans. 11; also Complainants' Record, Vol. 2, p. 1032–3, Ans. 64, test'y. of Ziegler.)

Fourth. It was not *invented* till some time between July 4, 1878, and November, 1878. (See Blake's Preliminary Interference Statement, Add. Proofs, p. 311.)

All the testimony in the Drawbaugh case goes to prove, beyond a doubt, that instrument "H" was produced about two years before instrument "J." It is proved by by Stees and Johnson (Add. Proofs, pp. 198–220), and corroborated by Drawbaugh (D. Vol. 2, p. 1012, 1,014, Ans. 1376, 1393), that this instrument, "J," was taken by Drawbaugh to Stees' office, in Harrisburg, about May 10, 1878, and tested on the Bell telephone line, and left with Mr. Stees about three months. Johnson and young Stees identify the instrument positively. They examined its internal construction at the time, and identify its mechanism as well as its case. Both of them recognize even its induction coils; and Stees swears to having himself accidentally dropped the instrument on the floor and *lost out its little carbons* at the time while it was in his father's office.

There is not a word of evidence in the record to meet this positive and circumstantial statement of two unimpeached and unimpeachable witnesses; nor can any amount of sophistry shake their dates. The fact that the test of instrument "J" was made when the "Phelps Snuff-Box Instruments" were in use on the Harrisburg telephone lines, and before the "crown" instruments displaced those of the "snuff-box" form, itself establishes the date as certainly prior to the winter of 1878–9; and the positive statement that the test was made immediately upon young Stees' return from the west, and before Johnson went to work for the transfer company, fix it beyond all question as in May, 1878.

This was before the "Blake Transmitter" was even thought of by its alleged inventor, Blake.

For the dates when the "Phelps Snuff-Box," the "Crown" and the "Blake Transmitter" were actually introduced into use at Harrisburg and used there on the Bell telephone lines, see testimony of complainants' witness Ziegler, (C. Vol. 1, pp. 1025–35) as well as of Stees and Johnson, in the Overland Record.

Instrument "J" is manifestly an improvement upon instrument "H." We do not need to be told which was made first, for a glance at them tells the story so plainly that further evidence is superfluous. But human testimony can help us to ascertain *how long first*, the instrument "H" was made. All the witnesses, as we have already seen, concur in fixing "H" as about two years prior to "J."

The "Blake Transmitter" was the first carbon transmitter ever introduced into practical use on telephone lines. Was Daniel Drawbaugh, who, before Blake ever dreamed of a telephone transmitter, invented and perfected these two wonderfully developed and perfect instruments, "H" and "J," a "charlatan" or an "ignoramus?" Where did he get his knowledge of *carbon* transmitters at that early date? Who taught him how to make Blake Transmitters months before Blake ever dreamed of them? Is there any doubt that the man who could invent and perfect the carbon transmitter is a genius of the highest order, fully capable of inventing the whole art of electric speech transmission? Is there any doubt that his perfected carbon transmitter "H," of 1876, was preceded by a long line of other telephone instruments gradually approximating the perfected form, just as he has testified?

All the instruments produced after Feb. 14, 1876, to wit: L, M, G, O, H, N, J, and P, are good working telephones, as we learn from an inspection of them, and from the testimony of Park Benjamin, Daniel Drawbaugh, and the other witnesses who talked and heard speech transmitted through them from time to time as above set forth.

This completes the review of Mr. Drawbaugh's telephone instruments, from their beginning in 1866 or earlier down to 1880. Except the old original teacup transmitter and its receiver, all the instruments are in evidence in whole or in part—the material parts of all those produced prior to instrument I, of 1871, being in evidence, and instrument I, with all thereafter produced, being in evidence in their entirety. The chronological order of Drawbaugh's machines, as established by the evidence, is as follows:

Teacup transmitter and receiver	1866-7
F and B	1867-1869
C	1869-1870
I	1870-1871
A, with mouthpiece at center	1873
A, with mouthpiece at side of center	1874
D and E	January and February, 1875
L, M, G, O,	from February, 1875, to August, 1876
H	August, 1876
J, N, P,	1878

Between these several instruments, and perhaps even prior to the teacup transmitter, crude temporary experimental structures were produced, testified, modified, or, perhaps, thrown away, as is always the case with the production of inventions involving great study and labor. Drawbaugh (D. Vol. 2, p. 828, Ans. 402, 403), testifies that such was his habit while developing his telephone invention. Harman K. Drawbaugh (D. Vol. 1, p. 559) testifies that "D" and "E" grew out of such structures which his uncle had made prior to January, 1875, and (Ans. 75) that he knew of other temporary experimental structures as early as 1872. Henry F. Drawbaugh (D. Vol. 1, pp. 405-6, Ans. 71) alludes to seeing one of these temporary structures "among the first that he was working at," and which he states was in 1872, although it was probably in 1866 or 1867, and may have been the receiver used with the old teacup transmitter. Our reason for thinking that it was in 1866 or 1867 instead of 1872 is that Henry F. Drawbaugh does not recollect anything about the talking machines prior to 1872, and therefore fixes all his dates from that year, whereas it is conclusively proved that he was cognizant of the invention in 1867, 1868 and 1869, and was telling others of it at that time. (See testimony of Bricker, D. S-reb., p. 1083); Spafford, Id., p. 1089; McHenry, Id. p. 1092; William

North, Id., p. 1102; Samuel A. North, Id., p. 1105; Murphy, Id., p. 1063; Graham, Id., p. 1057; Dougherty, Id., p. 1131).

In this connection, it is proper to call the attention of the court to the remarkable fairness and candor shown by all the Drawbaughs in giving their testimony, and to their self-evident freedom from any disposition to push their dates back earlier than the facts would warrant.

The Natural Evolution of Drawbaugh's Instruments.

In reviewing this series of instruments, their perfectly natural development, one from the other, appears conspicuously, and is strong internal evidence of the truthfulness of the history. First, he makes the old teacup transmitter, and develops its receiver to the form shown in Exhibit Drawbaugh sketch No. 2. (D. Vol. 2, p. 762.) Then by experiment he finds that the pulverized low conductor should be more closely confined, and the pressure upon it rendered more easily adjustable; and, hence, the idea of placing it on a suspended adjustable box occurs. He also discovers that the sounds should be converged upon the diaphragm, and this leads to the wooden cover and mouthpiece. The result of these changes is the tumbler transmitter, Exhibit "F." In working with the receiver, he discovers that the string and spring armature-support are superfluous, and thus the receiver develops into Exhibit "B." In the trial of different materials for diaphragms, he finds that sheet metal or other hard materials will answer the purpose better than the membrane, and this leads to the metal diaphragm of Exhibit "F" reproduced. But the tin can B is crude and imperfect, and so he goes to work to make a new receiver C of more perfect construction. He tries this first with two connected membrane diaphragms as an experiment, but finds one superfluous, discards it, shortens up the box or case so as to bring his ear nearest to the vibrating surface, and applies a thin metal diaphragm to the receiver, as he had already on the transmitter. In working with this, the idea occurs to him of testing it as a transmitter, with B as a receiver, and he gets some results, but probably feeble. He discovers that by placing a permanent magnet against the heel of the electro-magnet and thus giving the electro-magnet stronger polarity, these results are wonderfully improved, and this produces the magneto-telephone, Exhibit C reproduced. But in C reproduced the parts are all exposed and inconvienently arranged; he goes to work to enclose them; the attempt to enclose suggests arranging the permanent magnet more compactly; and from these studies comes instrument I, the first telephone having all the parts securely and rigidly enclosed in a box or case. Continued experiments satisfy him that the enclosed space between the mouth orifice and diaphragm should be reduced as much as possible, and hence he arrives at the second and flat form of cover to "I," the inner surface of which is quite close to the surface of the diaphragm. He conceives that the instrument can be still further condensed and compacted, and, probably after numerous experiments, Exhibit A is the result,—a very compact and convenient instrument, but, like C and I, having a diaphragm of large diameter. The large diaphragms were observed to give false vibrations, and, after further experiments, he conceived the idea of damping out the false vibrations by means of an adjustable rubber pad, and, hence, moved the mouth orifice to one side of the center, and applied the dampening pad and screw. Still further experiments convinced him that the diaphragms themselves were at fault, and he discovered that by reducing them in size, the best results could be attained. He made crude instruments to test and settle the matter, and, finding his conclusions verified, reconstructed his crude experimental instruments into two small, compact working instruments, Exhibits "D" and "E," in January and February, 1875.

The magneto-telephone was now completed—perfect. No higher development of it has ever yet been made by all the skill, science and ingenuity of the world. *We do not, to-day, know that it can be carried further than Drawbaugh had carried it as early as March 1, 1875.*

But operations to construct an improved carbon transmitter had been suspended, from about 1870, when the first magneto-telephone was made, until the final perfection of the magneto-telephones in Exhibits "D" and "E," although, meanwhile, he appears to have used F quite commonly in testing the quality and effects of different low-conducting substances, and, perhaps, to resolve other questions that occurred from time to time. But having, in February, 1875, reached high-water mark so far as the magneto-telephone was concerned, Drawbaugh again, after the production of "D" and "E," turned his attention almost exclusively to the further development of the carbon transmitter. The carbon transmitting instrument could not be used as a receiver, while, on the contrary, the magneto instruments could be used for both purposes. The thought occurred to him that, possibly, an instrument could be made which would combine in one a carbon transmitter and a receiver. He had demonstrated that the small, compact form of "D" and "E" was advantageous, and he, therefore, studied to produce an instrument nearly in the same form, combining the carbon transmitter with the receiver. To accomplish this the carbon must be arranged more compactly than in the old F. The idea dawned, of consolidating the carbon into blocks and arranging these blocks in a small, narrow, tube-shaped cup instead of the wide, flat cup of instrument F. It was about this time, probably, that Holsinger, who was never at his shop after November 27, 1876, saw him baking the carbon composition into small cakes, as set forth in D. Vol. 1, p. 366, Ans. 56, 57. After experimenting with these cakes of hard carbon in a temporary tumbler instrument (Holsinger, Id. Ans. 57), he arranged them as in reproduced instruments "L" and "M," in which the small cakes were supported in a tube placed, evidently for the purpose of compactness, between the coils, and in which a permanent magnet was arranged beneath the coils, and the electric connections were such that the same instrument served both as a carbon transmitter and a receiver. The hard carbons worked satisfactorily, and he determined to construct a pair of transmitters with hard carbons, without combining receiving mechanism in the same instrument, and from this resulted "G" and "O." After making "G" and "O," he used L and M for further experiments, and finally took out their carbons and retained them as simple magneto-instruments.

Meanwhile he had been testing the effect of an induction coil with them, as stated in his 289th, 290th and 291st answers, pp. 799, 800, and it was found to be of important advantage; and he determined to construct an instrument combining in one all the important improvements in his carbon transmitters: As the result, Exhibit "H" appeared in August, 1876, with its metal diaphragm (from old F) corrugated (from old C) and having false vibrations damped out (from old "A") with the small diaphragm (from old "D" and "E") and the induction coils. At some period, he had recognized the desirability of an alarm, to call the attention of the operator when a person at the further end of the line wished to communicate, and to this completed and perfected instrument he attached a magneto-alarm bell. The carbon transmitter was perfect in L, M, G and O, but, in H, it was brought to almost the present commercial form, and provided with every appliance necessary for practical business purposes.

In 1876 or 1877, however, he conceived that several currents, all modified independently by separate sets of carbons, might be united on the main line, and thus more powerful and far-reaching effects be attained for long-distance lines; and as a result of his studies in this direction, the multiple instrument, J. appears, in the spring of 1878. At about the same time, "N" was made to exhibit the effects of a permanently polarized steel diaphragm. And, lastly, all the carbon and magneto improvements were combined in one large-sized instrument "P," in form adapted for convenient practical use.

Nothing can be more convincing to the mind as to Drawbaugh's originality and priority of invention than this review of its gradual and natural development from the first crude experimental instruments to the perfected receiver "A," in 1874, the perfected magneto-telephones, "D" and "E," in January and February, 1875, and the perfected carbon transmitters, "L," "M," "G," "O," and "H," between February, 1875, and August, 1876, especially when studied in connection with the overwhelming evidence as to the dates of the several instruments and improvements made by him. The invention was undoubtedly in a patentable condition as soon as the magneto-instruments "C" and "I" were produced, in 1870 and 1871, and possibly before; but it was completed in every respect, even in form for immediate commercial use, in January and February, 1875, in instruments still extant and serviceable, and which the complainants' experts are obliged to admit are perfected magneto-telephones, and of which the complainants' counsel, in their brief in the Overland case, in January, 1884, stated that "A is a highly organized magneto-receiver with a neutral magnet. The case is of black walnut, nicely "turned, and furnished with screw cups to attach the wires to," and "D and E are a pair of magneto-instruments with permanent magnets. They are highly organized, inclosed in turned, black walnut cases, and with most of the refined improvements of detail found in the best commercial instruments of to-day, though they are rather feeble," and further stated, in their printed argument in the same case, to be "perfect magnetos."

The great invention thus produced by Mr. Drawbaugh in advance of all other claimants, instead of bringing him merited honor and fortune, resulted, as has often been the case in the history of the arts, in bringing upon him ridicule, neglect, and a terrible struggle for even the necessaries of life.

Efforts of Drawbaugh to interest others in his telephone inventions, and reasons why he did not succeed in such efforts.

The value of the speaking telephone was then unknown and unappreciated; it was, in the eyes of most men, a curious but practically worthless scientific toy, as the more wonderful phonograph still remains. The complainants' own evidence proves this conclusively. The Scientific American of October 6, 1877, spoke of many people having hastily pronounced the Bell telephone only "a beautiful scientific toy" (C. Vol. 1, p. 273). The New York Tribune of November 9, 1876, seemed to think that its practical use would be mainly for *diplomacy and courtship*. "Of what use is such an invention? Well, there may be occasions of state when it is necessary for officials who are far apart to talk with each other without the interference of an operator. Or some lover may wish to pop the question directly into the ear of a lady and hear for himself her reply, though miles away; it is not for us to guess how courtships will be carried on in the twentieth century." (C. Vol. 1, p. 250.) Mr. Bell's financial backer, Gardiner G. Hubbard, an old telegraph man, had no faith in the pecuniary value of transmitting speech in place of the telegraph, and "discouraged work upon the speaking telephone." (C. Vol. 2, p. 1613, near bottom of page.) Gardiner G. Hubbard testified in the Dowd case as follows:

"Int. 15. State whether or not Professor Bell talked with you during the summer or autumn of 1875 upon the subject of the electrical transmission of speech, and how much his mind seemed to be occupied with that subject?

"Ans. He did speak with me. His mind seemed to me to be occupied with it *a great deal more than was to my pecuniary advantage, as I did not then believe the transmission of speech could ever be made commercially valuable*, and I *remonstrated with him for spending so much time upon the subject*.

"Int. 16. What did you want him to spend his time upon, and why?

"Ans. Upon instruments that would transmit many musical notes simultaneously, or upon an autograph telegraph upon which he was working, *as I believed such instruments would be of more pecuniary value than any instrument for transmitting speech.*" (C. Vol. 2, p. 1662; C. exhibits, 959.)

Not only Mr. Hubbard, but also Mr. Sanders held this belief, as Mr. Bell testifies near the bottom of p. 1666, C. Vol. 2:—

> "At that time I was again working at the combination of instruments necessary to put my autograph telegraph into practical operation, *as Mr. Hubbard and Mr. Sanders thought that it would prove the most immediately valuable of all my inventions.* It was their understanding that I should devote the greater part of my time to the improvement of this application of multiple telegraphy."

Mr. William Orton, president of the Western Union Telegraph Company, had knowledge of the Bell telephone as early as April 7, 1877, as appears from the letter signed by him and others, printed in C. Vol. 1, p. 270, and had his attention pointedly called to it by Mr. Pope, the "special advisory electrical expert" of that company, and also of the Gold and Stock Telegraph Company, of which Mr. Orton was likewise president, *yet he did not stir in the matter of attempting to acquire an interest under it till the summer or fall of 1878*, as we learn from Mr. Pope's deposition (C. Vol. 2, pp. 1285–1287, Ans. 1, 2; p. 1428, Ans. 318, 314). And Mr. Bell says that he, himself, kept his mouth very closely shut at first, fearing that *ridicule* would be attached to the idea of transmitting vocal sounds telephonically (C. Exhibits, p. 986). The accidental presence of two great men, the Emperor of Brazil and Sir William Thompson, at the Centennial, and their enthusiasm over even the idea of electrically transmitting speech, undoubtedly did more to render the telephone immediately famous and eventually successful as the basis of a commercial enterprise than all other causes.

Such being the feeling of business men in the early stages of Bell's telephone, we are prepared to understand the reluctance of Drawbaugh's acquaintances to invest their money in his invention. He alone, of all who saw and tested the machines, seems to have had something like a correct idea of its future uses and its value. He always presented it to others as a great and valuable invention, and, in spite of their indifference, or commiseration, or ridicule, never wavered in his faith in it; maintaining, from the beginning, as we have already seen, that it would take the place of the telegraph and would eventually be used for communicating speech across the ocean. He told *Shank*, in 1874 or 1875, that it was the greatest invention that ever was known. (Shank, D. Vol. 1, p. 23, Ans. 45); *Waggoner*, in November, 1874, that it would save a great deal of money (D. Vol. 1, p. 123-4, Ans. 21); *Springer*, in 1876, that it would be a fortune to him (Id. p. 187, Ans. 48); *Shettle*, about 1872, that it would be worth a great deal of money (Id. p. 206, Ans. 4); *Weber*, in 1874, that it beat all his other inventions (Id. p. 245, Ans. 55½); *Bates*, that if he could get it patented he could make a fortune out of it (Id. p. 421, Ans. 23, 24); *Wolf*, from Feb. 20 to March 8, 1875, that he would be one of the richest of men if he could get it patented (D. Vol. 2, p. 675, Ans. 8); *Draper*, in 1874, that it was one of the greatest inventions of the age (D. Vol. 2, p. 1126, Ans. 15); *Eicholtz*, in 1873, that there was plenty of money in it (D. S.-reb. p. 154, Ans. 18); *Orlando Kahney*, in 1876, that it would make him an independent fortune (C. Vol. 1, p. 995, Ans. 51). In the year 1876 his whole mind appeared to be on this talking-machine (Springer, D. Vol 1, p. 188, Ans. 58). From Sept., 1873, to Nov. 27, 1876, "He appeared to be crazy on it. I often tried to get information from him on other subjects and about half a minute's talk would turn him right on the talking machines." (Holsinger, Id. pp. 364–5, Ans. 45.) From 1876 to 1880, "His whole heart and desire was on the telephone." (W. S. Dellinger, Id. p. 442, Ans. 45). Mrs. Drawbaugh told Chellis that she had wanted him to lay it aside and he had replied that "he would go to the poor-house before he would give up working on it." (Chellis, Id. pp. 526–7 Ans. 16). In 1874 and 1875, he was most interested in the talking machine and had it most at heart (Updegraff, D. Vol. 2, p. 1087, Ans. 34). From 1871 onward he was working on it nearly all the time, day and night, and often till late at night (Condry, D. Vol. 1, p. 89; Orris, Id. p. 170; Springer, Id. p. 182; I. D. Kahney, Id. p. 201; Shettel, Id. p. 206; Shireman, Id. p. 259; Hawn, Id. p. 266; J. C. Smith, Id. p. 334; Fetrow, Id. p. 347; Holsinger, Id. p. 360; H. F. Drawbaugh, Id. p. 396; Dellinger, Id. p. 439; George Free, Id. p. 484; Moffitt, Id. p. 494; D. M. Ditlow, Id. p. 573; Moore. Id. p. 614; H. K. Drawbaugh, Id. p. 550; J. B. Drawbaugh, Id. p. 575; G. W. Drawbaugh, Id. p. 597; Herr, D. Vol. 2, p. 667; Jefferies, Id. p. 678). And he is still experimenting on it like hundreds of other inventors, trying to get better results than have been yet attained with the speaking telephone (Drawbaugh, D. Vol. 2, p. 805, Ans. 317), and believes that "it has not yet got near to what it will" (Id. same page, Ans. 318).

During all those years, from 1869 to 1880, it was his complete absorption in his great invention that kept him poor. He was a good mechanic and could easily have earned a living, had his mind been free from this controlling influence. *Holsinger*, referring to the period from September, 1873, to November 27, 1876, says (Ans. 45) that Drawbaugh appeared to be crazy on the subject, and in cross-examination testified as follows: (D. Vol. 1, pp. 364-5).

"C. Q. 108. While you lived at Eberly's Mills was not Drawbaugh capable of earning all he needed, if he would only work steadily?

"A. Yes, sir; he did work steadily, intently—never lost a moment, but, *influenced by some supernatural or other power, did not happen to work at such things as did, or would, bring him the required necessaries for the sustenance of himself and family.*

"C. Q. 109. What things did he work at?

"A. He put a great deal of his time in experimenting on his talking machine; *in fact, so near all his time, that he got very little earned.*"

Shettel, referring to the year 1878, says (D. Vol, 1, p. 311-12, Ans. 54, 55) that Drawbaugh's mind was so absorbed in the telephone that he could make no progress for the clock company, and, in consequence, witness sold out and retired from the business. *Chellis*, in 1879 (D. Vol. 1, p. 526, Ans. 15, 16, 17), experienced the same condition of affairs, and in order to induce Drawbaugh to attend to his faucet work more closely, promised to go into the telephone invention with him (Ans. 17-20). *J. B. Drawbaugh*, referring to the period from 1869 to 1880, testifies (D. Vol. 1, pp. 583-7, Ans. 93, 94, 69, 64, 97) that his brother Daniel could have been able to make a good living, and more, if he had not had his mind and his time so completely absorbed in his telephone inventions. *Henry F. Drawbaugh*, referring to the period from his first knowledge of the talking-machine onward, testifies that his brother John was afraid Daniel would go crazy over the subject, and said, at one time: "He is half crazy now with studying." (Ans. 45, D. Vol. 1, p. 401.) *Harman K. Drawbaugh* (D. Vol. 1, p. 567, Ans. 133, 134) testifies that John was accustomed to urge Daniel to leave his invention and go to work at something that would provide for his family. *Herr* (D. Vol. 2, pp. 670–1, Ans. 29, 30), referring to the period from 1870 to 1874, testifies that when he was having some work done by Drawbaugh, the latter would, even in his presence, leave his work and try some idea on the telephone, and thus delayed witness' work. *Harman K. Drawbaugh* (D. Vol. 1, p. 554, Ans. 35) testifies that his uncle, Daniel, was so absorbed in his talking machine in the beginning of 1875, that he neglected a job which he had taken for Wilson Bear and others, and finally got witness to do it for him. . But it is hardly necessary to cite further specific testimony on this point, as all the witnesses concur upon it. Drawbaugh himself testifies (D. Vol. 2, p. 831–2, Ans. 424–426) that his work on the telephone kept him poor, and that even with close economy, he was obliged to contract debts which annoyed him and at times took his attention away from his inventive labors.

Again and again, through all these years, he applied to his neighbors, friends, relatives, and even to strangers, for pecuniary assistance to get his talking machine patented and introduced into use, offering them a half interest in it for their help, but they uniformly declined to invest their money in a talking machine.

Mr. Herr, of Harrisburg, Pa., testifies that, as early as 1870 or 1871, Drawbaugh applied to him for help (D. Vol. 2, p. 668):

"Q. 10. How often did he speak to you about that invention?

"Ans. To the best of my recollection he drawed my attention to it every time he came there after the first time he showed it to me; his object was to secure his invention, by getting a caveat, or some such thing he called it, and he wanted money to get it; he was a stranger to me.

"Q. 11. What did he say about his money matters, and about his wanting to get money to protect his invention?

"Ans. He said he was a poor man, and he couldn't raise the means, *and if I would help him, or procure any person to assist him, he would give me a half interest.*"

CHRISTIAN EBERLY (D. Vol. 1, p. 115-6) testifies that Drawbaugh, prior to Jan. 1, 1871, desired him to go into copartnership with him on the telephone, Mr. Eberly to furnish the money for a half interest in the invention, and witness did not accept the proposal.

HENRY F. DRAWBAUGH (D. Vol. 1, p. 400-1, Ans. 41-43), testifies that from 1872 to 1879 his brother, Daniel, urged him to go in with him and furnish the means for this invention; and failing in this tried to borrow money from him for the purpose, but Henry, like Gardiner G. Hubbard, was fearful there was no money in it (Ans. 45).

Henry once asked a telegraph operator, Mr. Byers (Ans. 111, and see Byers, Id., p. 509), his opinion of its commercial value, and Byers discouraged him about it, and told him the telegraph people never would use it. *Daniel asked Henry to intercede with others to get him assistance, and he tried to do so, and saw different parties for him* (Ans. 56), but evidently without effect.

MAJOR HENRY SNYDER, of Newville, Pa., testifies (Id., pp. 513-5) that Henry F. Drawbaugh came to him half a dozen times, in 1872, 3, or 4, and asked him to go into the enterprise with Daniel, to get the invention patented and establish its manufacture. Henry urged it upon him, assured him of its capacity to perform its work, and offered him a half interest in it, but he declined to go into it.

This testimony was confirmed in the Overland case by the depositions of Major Snyder's son, JOHN H. SNYDER (Add. Proofs, pp. 160–164), and EDWARD W. EBY (Id. pp. 179–181), who fix the date positively as just prior to June 19, 1873.

HENRY BAYLOR, of York, Pa., testifies (Id., pp. 150–7), that from June, 1873, till the spring of 1876, Daniel Drawbaugh urged him to advance the means to patent it, and to take a half-interest in it. (Ans. 5.) Drawbaugh urged it on him whenever they met (Ans. 18), and at one time in 1873 witness was almost induced to risk a few hundred dollars in it, and would have done so had he not been in an anxious state of mind over his own business.

THOMAS DRAPER, of Dover, Del., testifies (D. Vol. 2, p. 1125), that in 1874 Drawbaugh wanted him to go into it and take an interest in it, but, although he thought it a good thing, yet he declined for the reason that he was living too far away and did not care to invest in it. Mrs. Draper also discouraged him from going into it. (See Mrs. Annie E. Draper, D. S–rej. p. 208, Ans. 2–5.)

JESSE EICHOLTZ, of Dauphin county, Pa., testifies (D. S–reb. p. 154, Ans. 17, 18), that Drawbaugh wanted him to go into it in November, 1873, and when he declined for want of means, asked him to urge it upon his friend, George B. Eyster, which he did.

EYSTER (Id., p. 890), corroborates Mr. Eicholtz's statement.

E. W. CHELLIS, of Harrisburg, Pa. (D. Vol. 1, p. 526), says that Drawbaugh repeatedly urged him to go into it in the early part of 1879, but witness was interested in the faucet and motor business and wished to push it along, and also was aware of the controversy that would arise with the Bell patents, and hence declined (Ans. 11-13.)

Dr. J. W. MOFFITT, of Harrisbugh, Pa., testifies that prior to the centennial year, and from that time on nearly every occasion when they would meet afterwards, Drawbaugh urged him to go into it and get it patented and put into use (Ans. 22, 23), and, if he had not the means, *then to get somebody else to do it*, but witness looked upon it as a mere toy or matter of amusement, rather than as an instrument of any utility. (Ans. 25.) In the latter part of the time witness was afraid of the litigation that would result with the Bell telephone interest (Ans. 28-30), and decided to go into the faucet business instead, which he thought would prove more immediately remunerative. (Ans. 24.)

Dr. MOFFIT's testimony is confirmed, in the Overland case, by the deposition of Col. GEORGE W. HUNTER, owner and proprietor of the Lochiel House, at Harrisburg, Pa., who testifies that Dr. Moffitt came to him and urged him to invest in Mr. Drawbaugh's invention, but he declined. He thinks this was before the centennial. (Add. Proofs, p. 172.)

WILLIAM R. GORGAS, of Harrisburg, Pa., testifies (D. S. reb., p. 1,128) that some time from 1873 to 1877, Drawbaugh came to him and wanted him to take a half interest in some invention—he forgets what—and patent it; but witness had lost about $4,000 in the old faucet and pump company, and "had had a surfeit of it," and, therefore, "didn't pay any attention to it."

JACOB E. SHETTEL, a member of the Clock Company

(D. Vol. 1, p. 212; Ans. 55½, 56, 57), testifies that, although Drawbaugh had urged the value of the talking-machine upon him as far back as about 1873, telling him there was money in it, and that it would be better than telegraphing (Ans. 4), yet he thought the clock of more pecuniary value, and went into that enterprise in preference to the telephone. People around the neighborhood shared the same opinion, and thought the clock a very valuable invention. (Ans. 58, 59.)

HARMAN K. DRAWBAUGH (D. Vol. 1, pp. 557-8) testifies that his uncle Daniel, as far back as 1872, wanted to get some men to go in with him and furnish money to patent the telephone and run the business; and afterwards *often urged witness to try to find such persons for him.* (Ans. 69.)

CAPT. J. A. MOORE (D. Vol. 1, p. 622), a member of the Axle Company, says that in May, 1875, Drawbaugh urged him to go into it, furnish the money to patent it and put it on the market, and offered him an interest in it if he would do so; but witness was engrossed in his own business and declined. (Ans. 23-25.)

WILSON BEAR, another member of the Axle Company (Id., p. 629), testifies that he has a faint recollection of Drawbaugh's offering him an interest in the invention and wanting him to furnish money to patent and introduce it (Ans. 10, 11), while the Axle Company were in business in 1875.

It appears from Christian Eberly's testimony (D. Vol. 1, p. 117) that Drawbaugh was, along about 1871 or 1872, trying to induce *Mr. Lee*, private secretary to Governor Geary, to take an interest in the invention. (Ans. 38-41.)

ELIAS GRAYBILL (D. S-reb. pp. 185, 186) testifies that in the summer of 1875, before September, Drawbaugh asked him to go into the telephone, take an interest, and get it patented. (Ans. 12–20.) Witness came very near doing it. (Ans. 47.)

ORLANDO KAHNEY (D. S-reb. p. 229, Ans. 35--45) testifies that in October, 1875, Drawbaugh tried to borrow seventy-five or one hundred dollars from him to patent the telephone.

ALFRED DITLOW (D. S-reb. p. 820, Ans. 3-6), testifies that prior to 1876 Drawbaugh applied to him for money to take out a patent, but he declined. This was, undoubtedly, for the telephone.

This array of evidence is further confirmed in the Overland case, by the testimony of ORRIS (Add. Proofs, p. 124, Ans. 34, 35), WOODBURN (*id.*, pp. 136–7, Ans. 34, 35), and EMRICK (*id.*, p. 132, Ans. 25), all of whom visited Drawbaugh's shop in July, 1873, just before the meeting of the Democratic County Convention, and saw his telephones, and to whom he made the statement that he had not the means to patent the invention himself, but was expecting pecuniary aid from somebody, possibly Major Snyder or Henry Baylor, both of whom were considering the matter about that time.

Mr. Drawbaugh is an extremely sensitive and diffident man (Moore, D. Vol. 1, p. 624, Ans. 36; H. F. Drawbaugh, *id.*, p. 402, Ans. 49, 50), and he seems to have approached a great many people on the subject indirectly, stating to them the value of the invention, his desire to patent it, his lack of means, and his wish to have somebody take hold of it with him—evidently hoping thereby to induce them to take hold of it themselves or to mention it to others who would do so. Thus he told *D. Balsley* (D. Vol. 1, p. 193), prior to 1874, that he himself had not the means (Ans. 15), but if he could get some person to help him they could make a nice thing out of it (Ans. 16), and that *he had asked his best friends and they had all refused him* (Ans. 17). Drawbaugh said that if he had the means, he would put it through very quick (Ans. 27). Witness did not go into it, because it was a subject unfamiliar to him (Ans. 18). He told his brother, Henry, that he had asked a great many to go in with him (*H. F. Drawbaugh*, D. Vol. 1, p. 403, Ans. 56). He told *W. H. Bates*, at various times, beginning in the summer of 1874, that he wanted to patent the invention (*Bates*, D. Vol. 1, pp. 419–26). In the summer of 1874, he told him that he would get it patented if he had the means, but *he had asked several men to assist him and they just laughed at him* (Ans. 15, 16). "Several times that I was there his mind seemed to be taken up with it; he said he would like to get it patented, but he had not the means to do it; he said he could make a fortune out of it" (Cross-Ans. 23, 24.) "He was talking about getting the talking machines patented; all that kept him from it was that he had not the means of getting it patented; that was his general conversation in all the interviews that we had about it" (Cross-Ans. 42). At first, when he showed witness instrument "C," he said he wanted to caveat it; afterwards, *when he showed him "A," "D" and "E," he said he had the invention perfected*, and wanted to patent it (Ans. 33, 49, 33, 34, 41). He told *Waggoner*, in November, 1874, *that the talking machine was perfected*, and that he was going to get it patented—at the same time showing him instrument "A" (Waggoner, D. Vol. 1, pp. 122–8, Ans. 5, 21, 9, 27–29, 24), *and saying that if he got a patent on it, it would be the first talking machine patent in the world* (Ans. 30). *Fettrow* testifies (Id. pp. 347–60), that in March, 1875 (Ans. 16), Drawbaugh told him that he had not the money to get a patent on it, but had been talking to a couple of men to go in with him and get it patented (Ans. 24). Witness would have gone in with him at that time if he had had the ready money in his pocket (Ans. 25, 89), but felt it his duty first to provide for his family before reaching out too far for other things (Ans. 94). *Hubler* and *Lenig*, who were at his shop together in January, 1874, testified that Drawbaugh told them he had the invention about completed and was ready to have it patented but did not have the means, and would have to find some way to push it through (Hubler, D. Vol. 2, p. 691, Ans. 9; Lenig, Id. p. 699, Ans. 4.) *Dr. Updegraff* testifies (D. Vol. 2, pp. 1082–84–85, Ans. 4, 12, 32) that in April, 1875, Drawbaugh stated to him that *all he wanted then was some one to go into it with him, and put money into it to get it patented*, and then he could talk directly through the wires instead of telegraphing (Ans. 4); that the same remarks were repeated at the visit of May, 1875, at which time the general conversation was on the machine and on his getting some person to go in with him to procure a patent and put it before the people (Ans. 12); and that, at all three visits, April, 1874, April, 1875, and May, 1875, "the great trouble," with Drawbaugh was want of money—"each time he talked about his trouble, that he didn't have the money to patent it." (Ans. 32). When *Sutton* was at the shop, in August, 1873, and asked why he did not get it patented. (*Sutton* D. Vol. 2, p. 1105, Ans. 14, 15), Drawbaugh explained to him that want of money was what prevented. To *Spangler*, in the fall of 1874, he made the same statement (Spangler, D. S.-reb. pp. 456–7, Ans. 29, 35). In the fall of 1877, he told *Kline* that he was too poor to get it patented, but that if he could get some help there was money in it. (Kline, D. Vol. 1, p. 627, Ans. 9.) In the early part of April, 1876, he told *J. G. Landis*, that he would like to patent it, and would, if he could secure the means (Landis, Id., p. 632, Ans. 8); and, six or eight months afterwards, gave him to understand that some person was going to take hold of it with him and furnish the needed assistance (Ans. 10, 14). To *Wolf* he stated in the early part of March, 1875 (D. Vol. 2, p. 674, Ans. 5, 6), that he hadn't the means to get it patented, but was poor (Ans. 9), but that, if he had the means to get it patented, he would be one of the richest men (Ans. 8). *Fisher* testifies (Id., pp. 688–90) that in 1868 or 1869, Drawbaugh told him he was going to bring it to perfection, and was making good progress with it (Ans. 2, 11); and that prior to the year 1875, he showed him instrument "A" and said either that he had made or was going to make application for a patent on it. (Ans. 21.) *Matthias* says (D. Vol. 1, p. 549, Ans. 26) that in the fall of 1877, Drawbaugh, showing him "H" and other instruments, said the invention was all completed, but that he was still improving it and that he would like to have a patent on it but was too poor. In 1878 he made the same remark to *N. D. Shoop* in reference to his poverty, adding that as soon as he could get the means he would have the talking machine patented (Shoop, Id., p. 464, Ans. 7). While *Springer* lived at Milltown, from April 1, 1876, till January 6 or 7, 1877, Drawbaugh said half a dozen times that his poverty prevented him from patenting the invention, but that if he only knew whom he could get to furnish the means he would go in with him. (Springer, Id., pp. 186–7, Ans. 40, 46, 47, 50.) While *Holsinger* lived there, from September 13, 1873, to November 27, 1876, Drawbaugh told him that he would patent the invention as soon as he could get the money to pay for it. (Id., p. 368, Ans. 63.) He would give anybody whom he could trust a fair interest in it, and had applied to people unsuccessfully for assistance (Ans. 64), but he evidently did not consider himself in a condition to borrow money to patent the invention and the improvements on it separately. *Millard* testifies (Id., p. 331, Ans. 72, 73) that Drawbaugh, with the experimenting that he was doing, could hardly make a living in 1874 and 1875, and gave witness to understand that he was too poor to patent the talking-machine, but would patent it as soon as he could secure the means. Drawbaugh made the same statements to *I. D. Kahney* (Id., p. 204, Ans. 41); to *D. W. Smith*, in 1874 (Id., p. 68, Ans. 19–21) and to *Zacharias* (Id., pp. 47–50, Ans. 3, 30, 31).

From this testimony, in connection with that already herein reviewed, the following facts are clearly established, viz.:

1. That, at least as early as the winter of 1874–5, Drawbaugh regarded his invention as completed and perfected, although he realized that other valuable improvements could and would be found out and added to it. (See Hubler, Lenig, Bates, Waggoner, Updegraff, Holsinger, Matthias and others.)

2. That from 1869 to 1880, he was in extreme poverty, in debt, with a large family to support, distressed and impoverished by sickness and death in his family, with no resources but his daily labor, with no employment except the odd jobs that came in from neighbors, and with his mind so absorbed by his telephone work that he was unable to apply himself efficiently to anything else.

3. That when, on a few occasions, he received small sums of money, they were immediately demanded for the payment of pressing debts and for his household necessities, so that at no time did he feel himself able to apply them to the securing of his inventions.

4. That he hoped to be able to interest others in the talking machine, and not only made reasonable efforts to that end himself, but tried to get his acquaintances to bring the matter before their friends; and at times was probably encouraged to believe that his efforts to get others interested were about to be successful.

5. That his efforts to get others to go with him all proved unsuccessful, and oftentimes resulted in subjecting him only to their ridicule.

6. That, when his overtures to others had failed; poor as he was, and hopeless as was his financial condition, he made efforts to borrow the money with which to patent the invention himself, and in that failed also.

The community not only took the same view of his invention that Gardiner G. Hubbard, Thomas Sanders, William Orton and others entertained in regard to the Bell invention when it first appeared, to wit: that it was merely a scientific toy of no financial value, but came to look upon the poor inventor as an enthusiastic "crank," and the knowledge of this fact came bitterly home to him. He testifies (D. Vol. 2, p. 831, Ans. 421, 422, 423), that they ridiculed him, told him that he was believed to be crazy, and that it was so talked at the village store. *Fetrow* says (D. Vol. 1, p. 350, Ans. 27) that the people around Milltown, referring to the invention "called it tomfoolery." *Waggoner* (Id. p. 124, Ans. 23) "laughed at it." *Yetter*, "who hardly knew what electricity meant at that time," "laughed at it." (Id. p. 137, Ans. 21.)

Lory (Id. p. 226, Ans. 8) "thought that Drawbaugh had turned out to be a fool." *Zimmerman* (Id. p. 417, Ans. 26) found *himself* considered crazy, because he believed in it. *Henry F. Drawbaugh* (Id., 401, Ans. 48) testifies that the invention caused people to believe his brother Daniel to be going crazy. *Bates* (Id. p. 420, Ans. 15) says that those to whom Drawbaugh applied for assistance to patent it "just laughed at him." *Rupp* (Id. p. 430, Ans. 34) "laughed at the idea" of its taking the place of the telegraph. *Byers*, the telegraph operator (Id. p. 510, Ans. 6), laughed at the idea of such an invention. *Bricker* (Id. pp. 510–1, Ans. 1) says Drawbaugh told him he was considered crazy, and people were not willing to assist him with money. *Musser* (Id. p. 607, Ans. 2) "thought it was tomfoolery," and would not even listen at the instrument when requested to. His brother, *John B. Drawbaugh* (Id. pp. 583–4, Ans. 64) characterized it as a "foolish thing," and tried hard to persuade him to abandon it and go to work to provide better for his family. *Lenig* (D. Vol. 2, p. 699, Ans. 1) thought it was a humbug. *Updegraff* (Id. pp. 1082–3, Ans. 4) at first doubted—thought Drawbaugh's statements were going too far—knew men sometimes got crazy on inventions, and suspected that he was one of that class; but, after testing the invention, believed in it. *Zearing* (D. S.-reb. pp. 125, 127) at first thought it a humbug (Ans. 29, 32), but, after testing it, changed his opinion (Ans. 39). Mrs. *Brown* (Id. p. 165, Ans. 21) "always made light of it," and Mrs. Drawbaugh joined with her (same Ans). *Sprenkel* (Id. p. 367, Ans. 22) says that the community regarded Drawbaugh as a foolish old man - silly—half-witted—for spending his time on such an invention. *Hosler* (Id. p. 369, Ans. 16) heard Drawbaugh called a "damned fool" for trying to make a talking-machine. *Graham* (Id. p. 1059, Ans. 13) thought Dan and Harry both crazy when Harry told him about it. *Murphy* (Id. p. 1063, Ans. 4) made the same remark as Graham.

Woods (Id., p. 1107, Ans 8) says it was spoken of in the community as "Drawbaugh's crazy talking machine."

Landis (Id., p. 904, Ans. 37) says Drawbaugh remarked that some thought him crazy.

W. W. Snyder (Id., p. 1074, Ans. 36, 39) "had great sympathy for him," and thought he was getting "cranky." The talking machine seemed so ridiculous that he "thought the man was beside himself." And, as we learn from the testimony of Chellis, H. F. Drawbaugh, Holsinger, Fettrow and others (and of Mrs. Drawbaugh herself in the Overland case), his wife opposed him from the beginning to the end, and his brothers tried to discourage him from his work.

Yet all this opposition, ridicule, poverty and discouragement never for a moment moved him to abandon the invention, nor diverted his mind from it. He seemed determined to cling to it, even if, as Mrs. Drawbaugh told Chellis, it should land him in the poor-house. In view of the evidence, no man can have the slightest doubt that if any one of his acquaintances had responded to his appeals for aid, the telephone would have been patented and introduced into public use long before March, 1876, and before the earliest experiments of Professor Bell.

THE COMPLAINANTS' ATTEMPT TO ANSWER THE DRAWBAUGH CASE.

In answer to the overwhelming proof of Drawbaugh's priority of invention, as contained in defendants' record, Vol. 1 and 2, the complainants, after raking the country with their detectives and agents, from the summer of 1880 to the summer of 1883, and spending fourteen months in putting in their so-called rebuttal, offered the court merely an unsupported *theory* and a few inconclusive *inferences*, and asked judgment thereon against the testimony of over a hundred witnesses.

Their *theory* was substantially as follows, viz:

First. That Drawbaugh never invented any telephone prior to Bell's exhibition at the Centennial.

Second. That he derived his idea in some way from Bell; and

Third. That after Bell's exhibition, telephones began to appear at Drawbaugh's shop, in the order substantially as stated by Drawbaugh.

In other words, that the history of Drawbaugh's telephones really commenced in the fall of 1876, instead of 1866.

This theory they attempt to support, first, by the "negative testimony" of from twenty to thirty witnesses who swear that they were at Drawbaugh's shop, or in the neighborhood, at different times from 1865 to the fall of 1876, without seeing or hearing of any telephones there; and, secondly, by the testimony of witnesses who have been at Drawbaugh's shop, or in the neighborhood, since the summer of 1876, some of whom, even then, had no knowledge of any telephones there, and others of whom had such knowledge, but only of the earlier instruments.

This class of evidence we shall refer to as the complainants' "negative evidence." It is weak, and, as a matter of law, entirely inconclusive as against positive testimony; and is, besides, specifically attacked and destroyed by the defendants in their surrebuttal and closing proofs.

Their *inferences* are equally weak, inconclusive and untenable. They consist mainly in the argument that because Drawbaugh did not patent his invention nor introduce it into public use, nor describe it in printed publications, prior to Bell, therefore the court must conclude that he never made it prior to Bell. Whatever force this argument might have in the absence of any explanation of Drawbaugh's circumstances is completely destroyed by the facts set forth in defendants' evidence and herein already reviewed.

The complainants also attacked the dates set forth in the testimony of the defendants' witnesses, Decker, S. Nichols, U. R. Nichols, Stephens, Hamacher and his scholars, Geistweit, G. H. Bowman, Herr, P. C. Zimmerman, Hoffman and Draper; but, with the exception of one of Decker's dates, in no case so as to affect any material fact or date established by said witnesses. Their plan evidently was to disprove the dates set up by a few of the defendants' witnesses, and then try to make up for their failure to shake other witnesses by asking the court to infer that because two or three were in error therefore all were. Whatever force there might have been in this argument was destoyed by their failure to establish the fact that any of the defendants' witnesses were in error as to any material fact or date.

We will consider these matters in the following order, to wit:

First. The complainants' negative evidence and the answer thereto.

Secondly. Their attack upon the dates or facts testified to by particular witnesses for the defendants.

Thirdly. Their argument as to the conclusion to be drawn from Drawbaugh's not patenting the invention, introducing it into commercial use, or announcing it in printed publications, prior to Bell.

I. THE COMPLAINANTS' NEGATIVE EVIDENCE, AND THE ANSWER THERETO.

This evidence and the defendants' reply thereto is fully and carefully analyzed and compared in Appendix C, to which the court is here referred, and which demonstrates the utter unreliability and worthlessness of all this class of evidence, so laboriously introduced to cumber the record in this case. In addition to what is there said, the following comments are appropriate to the subject here:

First. As a matter of law, all such evidence is intrinsically worthless as against affirmative evidence. The legal presumption is always radically and strongly in favor of the affirmative witnesses.

In Starkie on Evidence, Vol. 1, p. 516, section 32, the law is stated as follows:

> "If one witness were positively to swear that he saw or heard a fact, and another were merely to swear that he was present, but did not see or hear it, and the witnesses were equally faithworthy, the general principle would, in ordinary cases, create a preponderance in favor of the affirmative; for it would usually happen that a wit-

ness who swore positively, minutely, and circumstantially to a fact which was untrue, would be guilty of perjury, but it would by no means follow that a witness who swore negatively would be perjured, although the affirmative were true; the falsity of the testimony might be attributed to inattention, mistake, or defect of memory; and, therefore, even independently of the usual presumption in favor of innocence the probability would be in favor of the affirmative. If, for instance, two persons should remain in the same room for the same period of time, and one of them should swear that during that time he heard a clock in the room strike the hour, and the other should swear that he did not hear the clock strike, it is very possible that the fact might be true, and yet each might swear truly. It is not only possible, but probable that the latter witness, though in the same room, through inattention, might be unconscious of the fact, or, being conscious of it at the time, that the recollection had afterward faded from his memory. It follows, therefore, by way of corollary to the last proposition, that in such cases, unless the contrary manifestly appear, the presumption in favor of human veracity shall operate to support the affirmative."

In *Stitt* v. *Huidekopers*, 17 Wall., 354, 394, the Supreme court of the United States held as follows:

"The court charged the jury, 'that it is a rule of presumptions that ordinarily a witness who testifies to an affirmative is to be preferred to one who testifies to a negative, because he who testifies to a negative may have forgotten. It is possible to forget a thing that did happen. It is not possible to remember a thing that never existed.'

"We are of opinion that the charge was a sound exposition of a recognized rule of evidence of frequent application, and that the reason of the rule, as stated in the charge, dispenses with the need of further comment on it here."

In Gilbert on Evidence, edition of 1805, p. 140, the rule is stated as follows:

"One affirmative witness countervails the proof of several negative, because the affirmative may swear true and the negative also; for the negative may commonly be that they know not of the matter; the affirmative swears that is, and so the affirmative may be true and the negative also; for the thing that one swears may be true, though the other knew nothing of the matter."

In *Chambers & Yatman* v. *The Queen's Proctor*, 2 Curteis, 415, Sir Herbert Jenner says: "Upon general principles, affirmative is better than negative evidence. A person deposing to a fact which he states he saw, must either speak truly, or must have invented the story, or it must be sheer delusion. Not so with respect to negative evidence; a fact may have taken place in the very sight of a person, who may not have observed it, or if he did observe it may have forgotten it."

In this case, of three attesting witnesses to a will, two deposed that the testator did not sign the will in their presence, and the other, that he did. The court, Sir Herbert Jenner, held, on this proof, that the will was signed in the presence of the three witnesses.

In *Kennedy's Heirs* v. *Kennedy's Heirs*, 2 Ga., 571, p. 616, the court says: "The testimony of a witness who speaks positively to a fact is entitled to more consideration than several witnesses whose statements are merely negative." Of the former character is the evidence of the Dolines and most of the witnesses who sustain them —while the greater number of those who testify in opposition to them merely state that they were well acquainted with William (the grantor) "and Joshua Kennedy" (the grantee)—"never heard them say that the deed of 24 was intended to secure the property conveyed to the children of the former; that, had such been their intention, they believe they would have heard it. Such evidence is too loose and inconclusive to overthrow the positive declarations of respectable witnesses." In this case, the court held a deed which was absolute on its face to have been made in trust for the children of the grantor.

Seibert vs. *R. R. Co.*, 49 Barb., 583.
Hepburn v. *Bank*, 2 La. Ann., 1007.

And many other cases. In *Seibert* v. *R. R. Co.*, the court characterized negative evidence very strongly. Certain witnesses swore that the bell of the engine was rung, and other witnesses swore that, although present, they did not hear it. The court said that the negative testimony was only "*the slighest possible evidence, scarcely* "*sufficient uncontradicted to take the case to the jury.*" Yet this is the kind of evidence upon which the complainants rely to overthrow the vast accumulation of positive proofs on the part of the defendants.

Second. It is evident from the language of the authorities, that, for such evidence to have any weight at all, the negative witnesses must greatly outnumber the affirmative. The testimony of a single affirmative witness outweighs that of several negative. But, in this case, on the contrary, the affirmative witnesses enormously outnumber the negative. We have already seen that one hundred and ninety-seven persons testify to knowledge of Drawbaugh's talking machines prior to February 14, 1876, of whom one hundred and twenty-six actually saw the machines, and over sixty heard talk through them, or were present when others were successfully talking through them. To meet this array of proofs, the complainants gravely rely upon the fact, that, by searching several counties of Pennsylvania and four other states of the Union, forty-five persons could be found, some of whom were not in Drawbaugh's shop for years at a time, others never there after 1870 or 1872, others never there till 1877 or later, others never there except for some brief errand which they accomplished and then went away, and others hostile to him, who concur in stating that they either never saw or knew of his talking machines prior to 1876 or, if they did, have forgotten the fact! Such stuff is unworthy the serious consideration of the court, even if were uncontradicted, which it is not.

Third. Out of the forty-five negative witnesses, a large number, as will be seen from Appendix C, immediately contradict their own negative evidence. *William Darr*, who moved away from Milltown in the spring of 1870, but was introduced to swear that he never saw or heard of the talking machine, was obliged to testify, on cross-examination (see p. 130, *ante*), that Drawbaugh was talking to him about conversing across the Atlantic Ocean, prior to his removal from Milltown. *Abraham Ditlow*, who testified that he first knew of Drawbaugh's talking machines in March, 1877, was afterwards able to positively fix the date as far back as 1874. *Joseph Ditlow*, who testified that he first knew of the talking machine in March, 1877, upon reflection was convinced that he had known of the invention many years before that date. *Jacob Evans*, who testified that he first knew of it in 1877, subsequently remembered and testified positively to seeing it and talking through it about December 1, 1875. *Orlando Kahney*, who testified that he first knew of it about 1876 or 1877, had hardly arrived home in Illinois before he remembered seeing it as far back as 1875, and remembered seeing the circuit wires as early as 1873, and immediately wrote both the complainants' agent and counsel, desiring to be allowed to return and correct his testimony; but his request received no attention from them. Upon recall by the defendants, he testified to hearing talk through Drawbaugh's machines in July, 1875, and from his description of the instrument used by him as a receiver, it was undoubtedly "D" or "E."

William Natcher, never at Drawbaugh's shop after August 9, 1872, testified that Drawbaugh did not tell him of the talking machines while witness lived at Milltown; but, on recall by defendants, swore positively to having heard of them from others prior to August 9, 1872. *Michael H. Natcher*, never at Drawbaugh's shop after August 9, 1872, testified that he never saw Drawbaugh's talking machines while he lived at Milltown; but, on recall by defendants, declared that he had heard of them frequently while he had lived at Milltown.

These seven witnesses of the complainants prove, first, that prior to 1871, Drawbaugh was talking about transmitting speech across the Atlantic Ocean; secondly, that prior to August 9, 1872, his talking machine was a matter of common notoriety in Milltown and vicinity; and thirdly, that Drawbaugh's perfected machines were seen and successfully talked through by them in July, 1875, and about December 1, 1875. *Their testimony not only does not prove a negative, but, in fact, it overthrows the entire structure of negative evidence so carefully built up by the complainants, and it substantially proves the defendant's case!*

Fourth. Of the said forty-five negative witnessrs, twenty-three, to wit: *William Darr*, *Jacob Carns*, *Cyrus Bowman*, *Abraham Ditlow*, *Joseph Ditlow*, *Jacob Evans*, *Amos Frownfelter*, *William Frownfelter*, *Theodore Gris-*

singer, *Daniel Hart*, *Samuel F. Hauck*, *John F. Hursh*, *Orlando Kahney*, *Benjamin Kauffman*, *George W. Kissinger*, *George W. Mumper*, *Michael H. Natcher*, *William Natcher*, *J. C. Nesbit*, *E. M. Nichols*, *Henry S. Rupp*, *Geo. W. Rowe* and *William Sadler*, stand specifically rebutted by the evidence, as will be fully seen by reference to Appendix C. It was only after the defendants had completely disproved the negative testimony of the Ditlows, Evans and Kahney, that those witnesses were allowed to come back on the stand and correct their former statements.

Of the remaining twenty-two negative witnesses, nine, to wit: *M. J. Bailey*, *Geo. W. Heiges*, *Keifer*, *C. A. Landis*, *I. D. Landis*, *Rufus E. Shapley*, *Matthews*, *H. R. Mosser and Worley*, appear to have never been in Drawbaugh's shop till after the summer of 1876, and hence can give no evidence as to what was or was not in that shop prior to that time. This leaves but thirteen, out of the entire forty-five, to comment upon at this point. Of these thirteen *David A. Hauck* is shown, upon cross-examination, to have had a controversy with Drawbaugh in a patent-office interference, in the course of which it was proved that he attempted to steal Drawbaugh's faucet invention, and perjured himself to sustain his theft, and that he was adjudged by the patent office to have deliberately sworn to a gross and material falsehood in said proceeding, and his evidence was consequently disregarded.

Theophilus Weaver is shown upon cross-examination to be a disreputable shyster, employed by the complainants to assist in hunting up evidence against Drawbaugh before going on the witness stand, strongly prejudiced against the defendants, and to have contradicted himself in important particulars, so that his testimony is totally unreliable. The testimony of *Cyrus Kissinger*, *George F. Kissinger* and *George W. Kissinger*, *John M. Kissinger* and *J. C. Zimmerman*, all members of one family, is shown, by their record in the ram matter (see Appendix A), to be at least very questionable, if not altogether discredited, and is contradicted by William Natcher, who heard old Mr. Kissinger (George W.) speak of Drawbaugh's talking machine prior to August 9, 1872.

Of the entire number of negative witnesses, we have, therefore, only seven left, viz.: Harro, Lloyd, Major, Henry Neidig, Jacob Neidig, A. L. Rupp and George C. Rupp, who were at the shop prior to October, 1876, whose negative testimony is uncontradicted, and whose character is unimpeached by the evidence in the case.

Of these seven witnesses *Harro* is an unintelligent farm laborer, who worked at Samuel Hertzler's near Milltown from March 1, 1875, to March 1, 1877, and was occasionally in Drawbaugh's shop during that period, and testifies that he never saw nor heard of the talking machine. The best commentary that can be made on his evidence is that, *by the complainants' own proofs* (see testimony of Shapley and I. D. Landis), *the talking-machine was certainly there during a considerable portion of that time, and at least as early as October* 3, 1876, *and Drawbaugh had been talking through it, and was very enthusiastic about it.* It follows, therefore, that this witness' ignorance of its existence is, by the complainants' own showing, utterly inconclusive and immaterial. The invention was admittedly there, but he did not know it, or has forgotten it—probably the latter. *Major* is a man who worked for the Haucks, making faucets at Drawbaugh's shop, about one month in the summer of 1874. Witness did his work in the lower story of the shop, while Drawbaugh occupied the upper story. He was never in Drawbaugh's room but once (Ans. 22), at which time he saw things the character of which he did not know (Ans. 44). He did not even know where the faucet strainers were made (Ans. 14), although it is elsewhere in evidence that they were made on the same floor occupied by Drawbaugh (C. Vol. 1, p. 808). And, finally, he frankly admits (Ans. 40, 41), that his memory of events is very unreliable. It is obvious that the failure of such a witness to recollect the talking machines is not evidence.

Abraham L. Rupp and George C. Rupp were occasionally at Drawbaugh's shop, although they lived about two miles distant. Their visits appear to be infrequent, and usually on some errand, such as to grind knives, etc. They were there, separately, in the winter of 1877–8, and both of them saw and talked through the telephones there that winter, and they say that was the first knowledge they had of them. *There is, however, no evidence that either of these two witnesses was in that shop for many years prior to that winter.* One of them (C. Vol. 2, p. 1125, was asked whether he could swear that he had ever been there in the five years preceding that time, and answered (Ans. 32) that he could not swear that he had. Although they lived together, neither of them felt interest enough in a talking machine to mention to the other that he had seen it or talked through it (pp. 1126–27), and, until they testified, did not know of such fact. (p. 1127. Ans. 52.) When A. L. Rupp saw and talked through it, he took no interest in it and asked no questions about it. (pp. 1118–1119. Ans. 70–77.) He could not identify the instrument which he saw and listened at, but George identifies "A" as the one which was used when he (George) was there. (p. 1124.) It is perfectly manifest that the negative testimony of such witnesses is absolutely worthless.

The negative testimony of *Henry Neidig* and *Jacob Neidig*, father and son, is almost equally worthless. *Henry Neidig does not even state that he ever was in Drawbaugh's shop in his life.* He lived one or two miles away, and, when he had any errand at the shop, was in the habit of sending others, generally his son, to attend to it. (C. Vol. 2, p. 1526, Ans. 57.) When asked by complainants' counsel if his son was observant of, and interested in, mechanical matters, he gave the peculiarly guarded and suggestive answer (p. 1526. Ans. 58) that he was "*to a certain extent!*" The son says he was at the shop a good many times between the spring of 1870 and the fall of 1874 (C. Vol. 2, pp. 1236–7, Ans. 17), was there, but not as often as before, from the fall of 1874 to the spring of 1876 (Ans. 19), was there but seldom between the spring of 1876 and the spring of 1877 (Ans. 20); and never was there afterwards. (Ans. 21.)

In answers 108, 109, 113, 114, 117, etc., he says he cannot remember being there after the very early part of the year 1876. He began to learn his trade in Shiremanstown, in the fall of 1874 (Ans. 64), and it is probable that he was at Drawbaugh's shop very seldom after that date, as his occupation at Shiremanstown would be likely to keep him away.

When at the shop, from 1870 to 1874, he was generally on errands. (Ans. 18.) He could not testify that he ever saw an electric clock there prior to the summer of 1875 (Ans. 173); although it is abundantly established by both complainants and defendants that such clocks were there from 1870 to the present time. He says he never saw nor knew of Drawbaugh's talking machines, and thinks (Ans. 177) that he would not have forgotten them, because he remembered things of less importance. *He is the only witness, of all whom we have commented upon, whose negative testimony is of any value*, and how little even his testimony is worth can be judged from the fact that it would equally negative the clocks prior to the summer of 1875, although they were admittedly there all the time for many years before that date, and were, of course, much more conspicuous objects than the talking machines. *Isaac Lloyd*, of Harrisburg, was at Drawbaugh's shop twice in 1866 or 1867, on a business errand, before the shop was moved into the old clover mill (C, Vol. 2, p. 1265, Ans. 10), and again with Worley, in February, 1878 (Ans. 52), to see the electric clocks. Between 1867 and 1878, he was there two or three times, to wit: once, about 1871 or 1872, to see the nail feeder (Ans. 80-81) and twice (about 1875, 1876 or 1877—see Ans. 72-77), to get a lens ground. He never saw any telephones there, and until his visit of February, 1878, (the last time he was ever there—Ans. 71) did not hear of them. He thinks he got the lens ground in 1877 (Ans. 72, 73), but, if such was the fact, the telephones were certainly there at the time, although he does not remember them. (See testimony of complainants' witnesses, Shapley, Landis, A. Ditlow, J. Ditlow, O. Kahney, and others, who establish that fact.) That the witness did not see or hear of the telephones when he went to see the nail feeder in 1871 or 1872, is not remarkable. The nail feeder was kept in the basement (See Kahney, C. Vol. 3, p. 2038, Ans. 32; Nichols, C. Vol. 1, p. 854, Ans. 21) while the telephones were ordinarily kept in the second story above. It does not appear that Drawbaugh was present, nor that the witness went into the upper part of the building, nor that he did anything but look at the nail machine and go away. His two visits to the old shop near the grist mill in 1866 or 1867, were on business errands, and there is no significance whatever in the fact that he was not then shown the talking machines. Geo. B. Eyster (D. S-reb. p. 891, Ans. 4) testifies that, at that early period, Drawbaugh did not want everybody to see the talking machine, which was then incomplete and experimental. The only visits of this witness, therefore, at which he might reasonably be expected to have learned of the talking machines, were in 1877, when they were admittedly there, and February, 1878, when they were talked about although not shown. Such negative evidence fails to be of any force whatever.

This exhausts the entire list of negative witnesses examined by complainants in their rebuttal. The complainants evidently came to the conclusion, after finishing their rebuttal, that their negative evidence needed strengthening up, and, in the course of the year following, they found three additional persons sufficiently ignorant or forgetful of the facts to serve their purpose, and called them while putting in their evidence in rejoinder. Of these three persons, *John Kahney*, *George Ditlow* and *Simon C. Wilson*, Kahney, an old man, testified that although he was at Drawbaugh's shop a good many times he never saw or heard of the telephones which his four sons, Norman, Ira D., Orlando and Augustus, all saw, and several of them talked through prior to Bell's invention, while neither Ditlow, who lived at Camp Hill, nor Wilson, who lived in Harrisburg, appear to have ever been inside of Drawbaugh's shop in their lives, but can only testify to no recollection of having heard of the talking machines which were there.

Both under the rule of law above stated and also as a matter of simple common sense, the entire negative testimony of the forty-eight witnesses examined by the complainants to prove that there were no talking machines at Drawbaugh's shop prior to Bell's invention, would not rebut the affirmative testimony of a single credible witness who saw and talked through them.

Fifth. The complainants, in the very act of putting in their negative evidence, demonstrated its utter worthlessness. They proved by numerous witnesses that Drawbaugh had talking machines that were seen in 1876, 1877 and 1878, and were talked through and were even referred to in the newspapers, and then called witnesses to swear that they never heard or knew of them till 1880. (See William Sadler, C. Vol. 1, p. 1041, Ans. 45; Daniel Hart, Id. p. 1515, Ans. 24–28.) And yet those witnesses express, just as positively as the others, their opinion that he could not have had talking machines there without their knowledge. Other witnesses, such as Bailey, the Frownfelters, Grissinger, George W. Heiges, John F. Hursh, Mumper, Mosser, Nesbit, A. L. and Geo. C. Rupp and Weaver, say they never heard of them until about the latter part of 1877 or some time in 1878, although the machines were confessedly there long prior to those dates. These facts alone, when properly considered, show that negative evidence is utterly unreliable and inconclusive, and strongly commend the wisdom of the courts in classing it as the lowest species of evidence, inadmissible to rebut positive affirmative testimony.

Sixth: A great many facts appear in the case which curiously emphasize the worthlessness of negative evidence. Take, for one example, the testimony of J. C. Nesbit (C. Vol. 1, pp. 687–706). He was at Drawbaugh's shop in July or August, 1878, with one Hull (who died in the spring of 1879), to procure materials for a historical sketch of Milltown to be published in Wing's History of Cumberland County, and was called to prove that Drawbaugh did not mention the telephones. In connection with his testimony the complainants introduced the history containing a brief sketch of Milltown and even of Drawbaugh's shop, but silent as to telephones. In cross-examination, however, the defendants produced a manuscript made by Hull at that very visit, which conclusively showed that Drawbaugh *did* mention the telephones—both carbon and magneto—as his invention; and, upon the defendants' demand, the complainants were obliged to put in another copy of the same history, which was printed at the same time with the copy they first introduced, and which contained, in an appendix, the substance of Hull's manuscript statement about Drawbaugh's telephones! Here was shown, not only a reprehensible effort on the part of the complainants to deceive the court by introducing an incomplete book, but also an unanswerable rebuttal of the witness' negative testimony by means of a writing made during the very interview which formed the subject of his deposition. How many such witnesses as this would suffice to overthrow the positive testimony of one credible person! And who can say that the testimony of any one of the negative witnessess is more reliable than that of Nesbit? He is an intelligent and honest man, and was testifying to a visit of comparatively recent date; so that, had it not been for the annihilating manuscript, his testimony would have carried more weight than that of any other of the complainants' negative witnesses. As it stands, however, it is not only ruined, but, in its ruin, beautifully exposes the fallacy of the whole mass of negative evidence introduced in this case, and also exposes the questionable methods of the complainants. The defect of this kind of evidence is radical, and does not depend on the character of the witnesses. It is an attempt to establish facts by what people do not remember, and the more worthless the memory is, the better it serves the purpose.

Seven. The complainants' negative evidence, feeble as it is, is the best that they could gather by carefully selecting such as would answer their purpose and rejecting all other. For example, when *John A. Smith* recommended their agent, Comfort, to see Abraham May, as a person likely to know something of Drawbaugh's talking machines, Comfort's reply was that "*that wasn't the kind of evidence he wanted.*" (D. S-reb. p. 1117, Ans. 28.) So, too, when some of complainants' attorneys interviewed *Draper*, before the defendants even knew of his existence, and were assured by him that he had seen and talked through Drawbaugh's machines as early as 1874, the attorney promptly told him that he needn't be uneasy about being called away as a witness, as they should not want him! (Thos. Draper, D. Vol. 2, p. 1130.) *Jonathan Fry* was sought by Comfort, but when he told what he knew, he was no longer considered a desirable witness. (Fry, D. S-reb. p. 333.) Comfort also interviewed *Barber*, but having learned that he would be a positive, instead of a negative witness, had no further use for him. (Barber, D. S-reb. p. 375.) He also interviewed *Eicholz*, and, for the same reason, rejected his testimony. (Eicholz, D. S-reb. p. 155.) *Mrs. Spangler* told Comfort that she had seen the talking machines while her family lived at Milltown prior to August 9, 1872, and the complainants did not call her. (Id. p. 177.) *Graybill* was rejected by the complainants for a similar reason. (Id. p. 189.) It is evident that the truth was not wanted, but they were merely searching the community for persons who could be used to mislead the court. This one fact of their carefully sifting out and rejecting all who had any knowledge on the subject, ought to condemn their whole work.

Facts of the same character also appear in the Overland case, and place the complainants even in a worse light. The case of the Peoples' company was argued and submitted about the 1st of October, 1884. The evidence in the Overland company's case was not completed for several months thereafter, during which time much additional evidence was taken relative to Drawbaugh's invention, as we have already seen. In the argument of the People's case, Mr. Storrow, in words quoted in full (Add. Proofs, p. 142), made a savage assault upon the defendant for not having called as a witness, *David Stevenson, Jr.*, in the course of which he said:

"If there was a telephone there he must have known everything about it, but they do not put him on the witness stand. I do not need to argue the importance of that line of conduct. When you come to read the brief you will find case after case with comments upon the conclusive effect, under such circumstances, of the failure to call a witness by the party upon whom the burden, and upon whom a very heavy burden rests." *And yet Mr. Storrow knew when he uttered those words, that Mr. Stevenson if called, would have been a good witness for defendants*, for his agent, Comfort, had long before been informed by Mr. Stevenson that such was the fact. (See Add. Proofs, p. 149). And Stevenson's evidence alone ought to be conclusive of the case. (See Add. Proofs, pp. 141–155; 164–171.

So, also, the complainants' counsel in the court below, animadverted severely upon the defendants for not having called and examined more of the workmen of the old Faucet Company, and argued that our failure to do so, was evidence that such workmen would testify against us if called. But in the Overland case subsequently, two of those workmen, *Joseph H. Gregory* and *Emanuel K. Gregory*, of Taunton, Mass., were called and examined for defendants, and they testified not only to knowledge of Drawbaugh's telephones prior to December 5, 1870, *but that they had both informed Mr. Storrow's agent, Tompkins, of that fact several years before their examination as witnesses.* (Add. Proofs, pp. 184, 192, 193.)

We leave the court to make its own comments upon the course pursued in these matters by the complainants' counsel.

Complainants' counsel in the People's case below also commented harshly upon the fact that defendants had not called *Mrs. Drawbaugh* as a witness. In the Overland case she was subsequently called and examined, and her testimony not only establishes the successful use of the telephone in the summer of 1872, but sustains every part of the defense. (Add. Proofs, pp. 221–233).

Eight. In conclusion, so far as this topic is concerned, we may briefly recapitulate as follows: First, a majority of the negative witnesses are proved positively to have been looking at, or talking about, Drawbaugh's talking machines long prior to the dates fixed by them as the time of their earliest knowledge of such machines; secondly, of the remainder, a majority were never in Drawbaugh's shop until after the summer of 1876, and therefore cannot establish what was or was not there before that time; thirdly, of those who were there after the summer of 1876, a goodly number establish the fact that he had talking machines at least as early as October 3, 1876, and from that time onward; fourthly, yet others, in the same period, were utterly ignorant of such machines being there, and tend to negative the existence of the machines as strongly after October 3, 1876, as before that date; fifthly, a considerable number of the negative witnesses returned to the witness stand and testified positively to having seen and heard, and some to having talked through these machines prior to the date of Bell's invention; sixthly, the testimony of some of the negative witnesses is manifestly biased and unreliable, and one of the most important of them stands contradicted by a paper written during the very visit which he made to Drawbaugh's shop; seventhly, the affirmative witnesses outnumber the negative, more than four to one; eighthly, the negative witnesses do not represent the voice of the community, but were carefully sifted out by complainants' agents and attorneys; and, lastly, the rule of law condemns the whole class as incompetent to meet the testimony of affirmative witnesses who testify to facts within their own knowledge and memory.

We are justified, therefore, in asking the court to dismiss the complainants' negative evidence as utterly worthless—to lay it out of consideration altogether, as too trivial to be dignified by the further attention of a tribunal seeking for the truth.

2. THE COMPLAINANTS' ATTACKS UPON THE DATES OR FACTS TESTIFIED TO BY PARTICULAR WITNESSES FOR THE DEFENDANTS.

Out of the one hundred and ninety-seven witnesses who establish the date of Drawbaugh's invention as prior to February 14, 1876, the complainants have made a lame and impotent attempt to shake the dates of about a dozen, to wit, Decker, S. Nichols, N. R. Nichols, Stephen, Hamacher and his scholars, Geistweit, G. H. Bowman, Herr, P. C. Zimmerman, Hoffmann, Jacob Evans, Draper, and one or two others.

If we should lay all these witnesses out of consideration altogether, the dates and facts as to Drawbaugh's priority over Bell would still remain incontestibly established by more than one hundred and seventy-five credible witnesses, very many of whom were never at the shop after June 1, 1875, and, therefore, could not have confounded earlier with later dates. We might, with reason, dismiss the whole matter with this single commentary; but, in order that the court may fully understand the utter insignificance of complainants' efforts to meet our case, we shall briefly discuss this attempted specific rebuttal, which, in most instances, will be found simply farcical and ludicrous.

For example: (*Geistweit* D. Vol. 1, pp. 457-62) testified that he went to work to repair Musser's mill at New Cumberland, in June, 1870 (Ans. 3-12), and during the job worked "at millwrighting" (Ans. 2); that, after the millwrighting job was done, he worked in the mill about a year and a half (Ans. 5); that, while repairing the mill, he had occasion to use a ratchet-drill to bore an iron shaft, and went to Drawbaugh's shop at Milltown, to borrow one (Ans. 9–11); and that, on a visit to borrow the ratchet-drill he first saw and plainly heard talk through Drawbaugh's talking machines, "B" and "F." (Ans. 13–22.) He further testified that he was never at the shop after the fall of 1876 (Ans. 25), but that during the period from the summer of 1870 to the fall of 1876 he also saw Exhibit "D" or "E," or both (Ans. 26, 27), and probably "H" (Ans. 30, 31). To meet this evidence, complainants call Henry R. Mosser, who swears that the repairs on his mill began on June 26, 1871 (C. Vol. 1, p. 370, Ans. 26), at which time Geistweit commenced to work for him (Ans. 27), and worked about a year and a half (Ans. 31, 34), and that Geistweit helped to repair the mill in 1871 (Ans. 36), but he "never knew him as a millwright" (Ans. 23). *Now, Geistweit never testified that he was a millwright*, but only that he "worked at millwrighting" during that particular job, his general business being that of steam engineering. He erred just one year in the date of the job, which is a perfectly natural error after the lapse of more than ten years; and it is utterly immaterial whether his visit to Drawbaugh's shop was in July, 1870, or July, 1871—it was, at least, four years prior to Bell's invention, in either case. The materiality and force of Geistweit's testimony are not shaken in the least. *John H. Stephen* (D. Vol. 1, pp. 248–53), testifies that prior to 1875, and, he thinks, as early as 1870 (Ans. 3–6), he was at Drawbaugh's shop and first saw the talking machines there (Ans. 5–15); that, in 1875, he saw "D" or "E" (Ans. 17); and that, in 1876, he saw "C" (Ans. 15–16). He also testifies that when he first saw the talking machines he told his family on his return home (Ans. 18–20), and that he described

"B" and "F" to defendants' counsel before they produced the exhibits for his inspection. (Ans. 42.) To meet this evidence, the complainants call George W. Row (C. Vol. 2, p. 1533), who testifies that he worked as a laborer for Mr. Stephen in 1876 (Ans. 1–11, 27), when he was sixteen years old, and that in October, 1876, Mr. Stephen told him that Drawbaugh was making a talking machine (Ans. 12–24), but didn't tell him that he had recently seen it (Ans. 79), nor that he had not seen it long before that time (Ans. 80), nor that that was the first talking machine Drawbaugh had made (Ans. 81), nor that Drawbaugh had not told him of the talking machines long before that time (Ans. 82). All that Stephen said to witness was as follows:

> "The first he asked me whether I had heard about Dan. Drawbaugh's talking machine; I told him I didn't. Then he said that Dan. had told him last evening that he was making a talking machine, to talk from one place to another by a wire. *That was all that was said about it; if anything else was said about it I don't remember.*" (Ans. 78.)

Of course, this does not establish even a doubt as to the correctness of Stephen's testimony; but shows the absurdity of the stuff the complainants were attempting to use in "rebuttal." The defendants called Henry Otstot in surrebutal, who testified (D. S-reb. pp. 361, 362) that he was at Drawbaugh's shop with Mr. Stephen in 1870 or 1871, when Drawbaugh showed them his talking machines (Ans. 10-16); and that the last time when witness was ever at said shop was on the day of George B. Heck's sale (Ans. 1-10), which was on September 13, 1873 (J. B. Heck, D. S-reb. pp. 892-3). Witness never was there except on those two occasions (Ans. 2), and, on one of them, saw Exhibit C. (Ans. 25.) The result of the complainants' efforts here is, that, first, Mr. Stephen is not contradicted by their witness, and, secondly, that he is positively confirmed and his testimony materially strengthened by Otstot.

The attempt to rebut *Hamacher* and his scholars, *John F. Rupp* and *S. S. Rupp*, together with the neighboring schoolmaster, *Strong*, is equally weak and farcical. *Hamacher* testified (D. Vol. 1, pp. 289-310) that on the first day of February, 1876, he took certain of his pupils of the Cedar Run school and went with them to Robert J. Strong's school at the Gorgas school-house, and thence to Drawbaugh's shop .(Ans. 4-11, 116-124), where a number of talking machines were exhibited to them (Ans. 14), and, among others, Instrument "A." (Ans. 13.)

He produced (pp. 313, 314) the official report book of Mr. Strong's school, which contained an entry of the visit on February 1, 1876. He testified (Ans. 46-50) that he visited Drawbaugh's shop on that occasion to see the talking machines, which were at the time a matter of common talk in the community, and of which he had often spoken with John F. Rupp, one of his pupils. On the first day of February, 1876, his school held no session, and he gave as the reason for its not being in session that new desks were being put in. (Ans. 9.) *John F. Rupp* (D. Vol. 1, p. 311) corroborated Mr. Hamacher's testimony in every important particular, including the visit to Strong's school (Ans. 20), the visit to Drawbaugh's shop (Ans. 3-19), the date (Ans. 3), and the exhibition of the talking machines, (Ans. 9-18), among which he identifies "A" and "F." (Ans. 10-14). He was a pupil of Hamacher's, and quit schooling in the latter part of February, 1876, when he was a few weeks over twenty-one years old (Ans. 4–7), and he never attended a common school afterward (Ans. 8). It is, therefore, upon his evidence, absolutely certain that the visit was not later than February, 1876. He also testifies that he had heard of Drawbaugh's talking machine before the visit (Ans. 28); that he had talked to Mr. Hamacher about it before the visit (Ans. 27); and that he never was at Drawbaugh's shop since that day. (Ans. 32.) *S. S. Rupp*, another of Hamacher's pupils (D. Vol. 1, p. 572), confirms the visit to Strong's school and thence to Drawbaugh's shop, and the talking machines there. (Ans. 1.) *Robert J. Strong* (D. Vol. 1, pp. 375–81), referring to books of his school, which show the date of Hamacher's visit with the Rupps and others on February 1, 1876, testifies to his memory of the visit (Ans. 21, 22); says that Hamacher told him he was going from there to Drawbaugh's shop (Ans. 24); that Hamacher and John F. Rupp called at his school on their return from Drawbaugh's shop that afternoon (Ans. 25), and told him they had seen the talking machine there (Ans. 26). And he further states that Drawbaugh had shown him (Strong) the talking machine in November, 1875 (Ans. 7–17), when he went there to get a gun repaired (Ans. 7), and that he got his gun a few days afterward (Ans. 18), and has never been there since. (Ans. 19).

The report book of Mr. Strong for January and February, 1876, is copied into Defendants' Exhibits, pp. 12–15, and the record of Hamacher's visit with his scholars is shown at the lower left-hand corner of p. 15. Here is the positive, concurring testimony of four unimpeached witnesses, with a contemporary public township record fixing the date with the additional fact that *John F. Rupp* was twenty-one years of age in February, 1876, and hence became disqualified to attend the public schools thereafter, and never again did attend them, and with the witnesses also testifying to the date as a matter within their own memory. To rebut this conclusive proof, the complainants examine *George W. Mumper*, one of the school board (C. Vol. 2, pp. 1109, 1110), to show that the new desks were put into Hamacher's school-house between December 26, 1874, and May 22, 1875. The legal effect of this fact would be, *not to negative the visit of Hamacher and his scholars to Drawbaugh's shop and their inspection of the talking machines there*, but to show merely that either the interruption of Hamacher's school on February 1, 1876, was occasioned by *some other matter* than the putting in of the desks, or else that the visit *was a year earlier than the defendants' witnesses alleged!* From the instruments "A" and "E," identified by Hamacher and Rupp, the latter might have been the true explanation, as those instruments are proved to have been in existence prior to December 24, 1874; but Mr. Hamacher, on recall by the defendants (D. S. reb., pp. 519, 520), explained and showed from the school record that he and his scholars visited the Gorgas school on January 4, 1875, *where Mr. Eichelberger was then teaching*, which he stated was on the occasion of his own school being interrupted to put in the desks, and that he again visited it with his scholars on February 1, 1876, when Mr. Strong was teaching, on which occasion his school was interrupted by the leakage of snow and water through the roof; and he is fully confirmed by John F. Rupp, recalled (D. S.-reb., p. 517), whose diary contained an entry of the first visit to the Gorgas school. He had made a very natural mistake on an entirely irrelevant matter, to wit, the reason *why* his school-house was vacated on that day, but he had not mistaken the date of his visit to Strong's school and Drawbaugh's shop, nor the fact as to what was seen at the latter place. The testimony of Mumper only served to emphasize the fact stated by Strong in his answer 5, p. 375, *that he taught the Gorgas school only from September 13, 1875, to March, 1876,* so that the date of Hamacher's visit to Drawbaugh's shop, going from and returning to Strong's school in the Gorgas' school-house, became even the more strongly corroborated.

The complainants' attack upon the date fixed by *E. B. Hoffman,* and the defendants' conclusive answer to it, involve so long a discussion that we have given it separate consideration in Appendix B, to which the court is here referred, and from which it will be seen that Hoffman is conclusively confirmed both as to his visit to the shop and its date, and that the attack only served to materially strengthen his evidence in defendants' favor.

The same commentary may be made concerning their attack upon *Draper's* date, which is fully considered in Appendix A, and his date shown to stand entirely unimpeached.

One G. H. Bowman, a miller, testified (D. Vol. 1, pp. 466–70) that in February, 1876, he was doing some millwrighting for his brother, Cyrus Bowman, at the Eberly grist mill, and, while so employed, had no convenient place to work in at the grist mill, and so went down to Drawbaugh's shop to do the work, and while there saw and heard persons talking through the talking machines. Witness never was at the shop again till 1880 (Ans. 26). The job of work only took about half a day (Ans. 42). The work of making wagon axles was going on there at the time (Ans. 43). Dellinger & May took the grist mill when Cyrus Bowman gave it up (Ans. 54), and Jacob Evans was their miller (same answer). Dellinger & May took the mill March 1, 1876 (Ans. 52, 53; and see W. S. Dellinger, Id. p. 439; Jacob Evans, C. Vol. 1, p. 977, Ans. 30, 31; Cyrus Bowman, Id. p. 666, Ans. 1). Witness stated that his brother, Cyrus, while he ran the mill, rented it from George Leonard and "ran it on his own hook." (Ans. 49.) To rebut this evidence the complainants called Cyrus Bowman (C. Vol. 1, p. 666), who swore that George H. Bowman was milling for him in February, 1876, and *could not remember whether he did any millwrighting there or not* (Ans. 8, 13, 14), but that he might have done such work. (Ans. 14, 98.) He also testified that he, Cyrus, knew nothing of Drawbaugh's talking machines while he lived at Milltown, from April 1, 1874, to March 1, 1876, a fact which, even if true, does not disprove George H. Bowman's knowledge of them. He further tried to make it appear that he did not "run the mill on his own hook," but in copartnership with Mr. Leonard—a fact of no importance or value whatever—but on this attempt broke down in cross-examination (pp. 677-679), where it appeared he was in copartnership with Leonard in buying grain, grinding and disposing of it, but not in actually running the mill, nor in the custom work done at the mill for the neighbors. They afterwards called George Leonard as a witness on certain matters, and he confirmed Geo. H. Bowman's statement that Cyrus rented the mill and was, so far as the mill was concerned, Leonard's tenant, and not his copartner (C. Vol. 2, pp. 1203, 1204, Ans. 19-23), and that from April 1, 1875, to March 1, 1876, including the period covered by Geo. H. Bowman's testimony, they were not even copartners in buying and disposing of grain (Ans. 23). The whole effort thus resulted only in corroborating and confirming Geo. H. Bowman's testimony for defendants, not only in its dates, but even in immaterial details.

The defendants then took Cyrus Bowman in hand, and proved by Ramsey (D. S-reb., p. 1118) that a suit, which he had admitted was on one of the mill accounts (C. Vol. 1, p. 677, Ans. 72, 77), was brought by him alone, and not jointly with Mr. Leonard, thereby showing that he perfectly well knew he was not a co-partner with Leonard in the mill business, and also proved by *Harris* (D. S-reb., p. 465), *Hacket* (Id., p. 690), and *Mrs. Swigert* (Id., p. 869), that while Cyrus Bowman was living at Milltown from April 1, 1874, to March 1, 1876, they heard Drawbaugh's talking machines talked about in his family by his wife, his children, and even by himself! Their testimony is clear, positive and circumstantial, and such as to leave no reason to doubt its truthfulness. Mrs. Swigert is Mrs. Cyrus Bowman's sister, and was much at his house at that time; Hackett was one of his workmen in the mill in 1874, and Harris is Mrs. Cyrus Bowman's brother, and was in the habit of visiting at his house in Milltown.

The complainants then recalled Cyrus Bowman (C. Vol. 3, p. 2013), who testified to something clearly beyond his own knowedge, to wit., that while he lived at Milltown there was never any talk in his family by his *wife*, his *children*, or himself, about Drawbaugh's talking machines (Ans. 2), and denied talking to Harris or Mrs. Swigert about it (Ans. 3, 4), but was totally silent as to any talk with *Hackett*. They also called Mrs. Cyrus Bowman (Id. p. 2008), who said that she never heard of the talking machine while she lived at Milltown (Ans. 4).

In law the affirmative evidence of her brother and sister and the workman, Hackett, vastly outweighs the mere negative of Mr. and Mrs. Bowman, and it stands proved that Drawbaugh's talking machine was known to them prior to March, 1876, and even as early as the year 1874. The attempt of the complainants to rebut George H. Bowman totally fails, in every particular, and results, as usual, only in making the evidence of Drawbaugh's priority of invention stronger than before.

The attempt to rebut *Henry Herr* by the evidence of Henry Neidig (C. Vol. 2, pp. 1523, 1524) is so weak and puerile as hardly to be worth mentioning. Herr had testified (D. Vol. 2, p. 695) that he first knew of Drawbaugh's talking-machine and saw the old instruments "B" and probably "F," about the time when he was first ordering a hydraulic ram from Drawbaugh along about 1869, and when asked who directed him to go to Drawbaugh for the ram, replied: "*Some* of his neighbors had told me about his putting up rams; I *think* it was Harry Neidig, a cousin of mine; I think he had put one in for him." (Ans. 21.) Neidig testifies that his own ram was put in in May, 1871 (C. Vol. 2, p. 1522, Ans. 20), and he, also, "thinks" he is the person who advised Herr to go to Drawbaugh (Ans. 25), and that such advice was after his own ram was in (Ans. 32), which would, if true, make Herr's date of seeing Drawbaugh's talking machines not earlier than May, 1871. The testimony of both Herr and Neidig, however, leaves it uncertain whether Neidig is the man who directed Herr to go to Drawbaugh, although he may be. The only material question is whether Herr's knowledge of the talking machine was prior to Bell's invention or not. As settling this question, Herr testifies that, to the best of his recollection, it was before he was elected a Director of the Poor of Dauphin County, Pa., in 1871—a year or so before (Ans. 48, 49)—and that he only kept the ram till about 1874, or 1875, as near as he can recollect (Ans. 27); that his earliest knowledge of the talking machine was not long after he first went to Drawbaugh's shop (Ans. 6) and during that same year, to the best of his recollection; that he was there several times for a few years afterwards, to see about repairs, etc. (Ans. 29; that he has no recollection of being there after the beginning of the Centennial (Ans. 44), nor after the Axle Co. commenced work there in March, 1875 (Ans. 2), and never saw the Haucks there (Ans. 4), and that he saw a machine like "C" there towards the latter end of his visits, and about a couple of years after he first saw "B" and the glass instrument. (Ans. 16, 17.) He also says that Drawbaugh put in two rams for him, one to replace the first one, which had gotten out of order (Ans. 33). It is evident from these facts that his knowledge of Drawbaugh's telephone invention was long prior to Bell's earliest dates; and that is the only material fact in question.

In attempting to shake the memory of *Decker* as to one or two of his later dates, the complainants were somewhat more successful, although not to the extent of impeaching the general credibility of the witness, nor the truthfulness of the material parts of his testimony. He testified (D. Vol. 2, pp. 1109–20) that he made four visits to Drawbaugh's shop (Ans. 50), to wit: one in August, 1873 (Ans. 6, 7), one in the fall of 1874 (Ans. 13–21), one in August, 1875 (Ans. 22–38), and one in 1877 (Ans. 39–49), which latter date he fixed by the fact that the visit was soon after the exhibition of the Hazelton clock at Harrisburg, and after he quit working for Col. McCormick, in Sept., 1877. The complainants' proof shows that the Hazelton clock was exhibited from Dec. 25, 1877, to Jan. 5, 1878, and that witness quit working for McCormick March 30, 1878, which, if true, would tend to show that witness' fourth visit to Drawbaugh's shop was sometime in 1878 instead of 1877, and that his memory of dates is not altogether reliable. But as to the dates of his first, second and third visits, his statement is not rebutted, and the circumstances of these visits fix their dates quite conclusively. At the second visit, Kline was expecting soon to go into the axle business (Ans. 14–16) and at the third visit witness carried a box of lubricating grease to Mr. Kline, who was then engaged in the axle business at Drawbaugh's shop, and delivered it to him at said shop. (Ans. 24.) There is little or no room for mistake as to the date here, for Kline is proved to have become interested with Wilson Bear in the axle patent on June 19, 1874 (Bear, D. Vol. 1, p. 635, Ans. 3); to have formed the Axle Co. December 23, 1874 (Moore, Id., p. 614, Ans. 3); to have commenced active business at Drawbaugh's shop in the latter part of March, 1875 (Moore, Ans. 17); and to have retired from the axle business Feb. 29, 1876 (Moore, Ans. 4–7), which agrees with Decker's statement as to the time and circumstances of his second and third visits to the shop. Decker says he saw several talking machines at these two visits, and that Drawbaugh talked to him through them at the second visit (Ans. 17–20), and talked to Kline and him through them at the third visit (Ans. 26–38), and witness heard and answered back through the same instrument at which he had listened (Ans. 38). He thinks he saw "D" at the second visit, but probably has confounded the instruments then seen with those seen at his third visit in

1875. In answer 33, he states portions of the conversation held through the instruments in 1875, among which was an inquiry of Drawbaugh about his old friend, Jacob May, and a remark that he understood there was an increase in May's family, which fact the witness, although a near neighbor of May, at West Fairview village, *could not confirm.* Complainants afterwards called May to prove that there was no increase in his family in 1875, but that in no wise contradicts the witness, whose answer to Drawbaugh's remark or inquiry tended to establish the same fact. Drawbaugh lived about four miles from the village of West Farview, and had probably heard some unfounded rumor as to May's domestic affairs.

The result is, that a fair consideration of Decker's evidence will sustain the general accuracy of his testimony as to the first three visits and their dates, but will lead to the conclusion that his last visit was a year later than he supposed.

In view, however, of his mistake as to the date of his fourth visit, we have not referred to his testimony heretofore in this brief, nor counted him in among the witnesses who prove Drawbaugh's invention prior to January 14, 1876. Whatever his evidence is worth, it is additional to the defendants' evidence hereinbefore cited on that point.

The date fixed in the testimony of *Urias R. Nichols* is also attacked, but we think unsuccessfully. He swore that he was at Drawbaugh's shop and talked through the talking machines in January, 1875. (D., Vol. 1, pp. 89–97.) He fixed the date by the fact that he was on a visit to Harrisburg, in the second week of the session of the State Legislature, to see Representative Stevens with reference to getting a law enacted respecting private roads, and on his way home to York county, stopped at Drawbaugh's shop and saw and talked through the machines. (Ans. 4–17.) He also testified that he ordered some lime at Hake's Kiln on his way home, which was delivered to him on January 18, 1875 (Ans. 12–15), which date he fixed by a memorandum book (Ans. 15–16). He stated in cross-examination that he *thought* he told Mr. Croll and Levi Maish about the talking machines the same winter (Ans. 42–47), and that he had seen Drawbaugh's burr-dressing machine at Kunkel's mill in Lisburne, York county, Pennsylvania, before that time. (Ans. 46.) To rebut this evidence, the complainants produce Croll and Maish, who said he was in error in thinking he had told them at that early time. Mr. Maish recollected some such conversation, however, but thought it must have been after Bell's telephone became known, for the reason that he did not have it brought to his mind by seeing the Bell telephone when exhibited in 1877; but he frankly admitted in cross-answer 26 (C. Vol. 1, pp. 745–6), that it was possible that Nichols was correct about it. Nichols did not swear positively that he told either Croll or Maish about it in 1875, but only thought he did, and that it took place in Maish's office at York, Pa. Croll, however, states that he never was in Maish's office, and hence it is probable that Nichols confounded Croll with some other miller to whom he had casually mentioned it there. The complainants produced Hake's books and clerk, and it appeared that no entry of any sale of lime to Nichols was contained in the books in which the clerk testified all sales were entered at the time when they were made. This, however, may have been due to the accidental omission of the entry. The complainants also undertook to prove that no burr-dressing machine was ever at Kunkel's mill, but signally failed. They examined all the millers who worked in the mill from the year 1868 to the year 1880, *except one, Peter Kunkel, who ran the mill from the spring of 1870 to the spring of 1871* (see E. S. Kunkel, C. Vol. 1, p. 761, Ans. 2-5; J. S. Kunkel, Id., pp. 750, 753, Ans. 8, 38), and by whose omission the evidence is totally incomplete and inconclusive; and, further, they actually corroborated Nichols by E. S. Kunkel (Id., pp. 762-767, Ans. 9, 10, 29-49), who testified that there was a diamond burr-dressing machine at the mill at one time while he was miller, and in or about the year 1873 (Ans. 28, 29), which probably was the very occasion when Nichols saw it there. The testimony of Croll and Maish does not contradict Nichols as to any matter testified to positively by him; the testimony as to the burr-dressing machine carroborates him; and the omission of the entry in the lime-kiln book is easily explainable and is totally inconclusive to rebut his positive statement.

SAMUEL NICHOLS (D. Vol. 1, pp. 227-33) is another witness as to whose testimony a feeble and utterly inconclusive attempt was made to rebut. He testified that he saw and talked through the talking machine, "B" and "F" at Drawbaugh's shop about the summer of 1870 (Ans. 4), and, in answer to a question as to who was with him at the time, said, "My son-in-law, Samuel Bruce, was along with me at the time," &c., &c. (Ans. 5). To rebut this, they proved that Bruce did not marry Miss Nichols till June 10, 1876, (Spese, C. Vol. 1, p. 925,) and they examined Nichols' son, Edward Nichols, (Id. p. 858,) to prove that Samuel Nichols and Bruce were not intimately acquainted in 1870. Samuel Nichols, however, *had not tes-*

tified that Bruce was his son-in-law at the time of the visit, but merely referred to him as Samuel Bruce, my son-in-law, evidently to identify the person; nor had he testified that he was intimately acquainted with Bruce at the time, nor that Bruce had called at his house, nor that he and Bruce had gone from his house to Milltown together. For all that appears, he may have met Bruce and others at Milltown or near Drawbaugh's shop, and gone in with them to see the talking machines. Edward Nichols was only twelve years old at the time, and is obliged to admit (C. Vol. 1, p. 881) that his father ought to know about the facts much better than he. (Ans. 257.) Edward Nichols is one of the "negative witnesses," who worked a short time for the Haucks in Drawbaugh's shop about June, 1874 (Ans. 9), and says he never saw any talking machines there (Ans. 43). But his cross-examination shows that his memory is very defective—he cannot remember half of the machines and inventions which were admittedly at Drawbaugh's shop when he worked there; and his negative testimony as to the talking machines is specifically rebutted by his mother, Mrs. Leah Nichols (D. S-reb. pp. 731-2), and his sister, Mrs. Annie M. Reynolds, (Id. pp. 612-614,) who swears that he knew of them while he worked for the Haucks at Drawbaugh's shop, in 1874, and told about them at home, and said he had seen them, and talked to his father about them. The testimony of Samuel Nichols is, therefore, unshaken, and his knowledge of Drawbaugh's talking machines prior to Bell's invention is corroborated by two additional witnesses.

The complainants also make an attempt to turn the testimony of *P. C. Zimmerman* (D. Vol. 1, pp. 414–19) into a rebuttal of the alleged date of Drawbaugh's invention. Zimmerman testified that he saw instruments "F" and "B" at Drawbaugh's shop in February or March, 1871, just before he moved to Shiremanstown (Ans. 4-6, 15), and described them to defendants' counsel before they showed him the exhibits (Ans. 8-12), and that, when he saw the instruments in 1871, Drawbaugh explained them to him, told him he had talked through them, told him how far they could talk, said they were operated by electricity, described how he made the fine wire for the spools. (Ans. 17-23.) Witness also stated that during the winter of 1880-1881, pending this suit, Mr. Drawbaugh and Mr. Jacobs, one of defendants' counsel, called on him to ascertain whether he could testify to anything material to this controversy, and then followed this interrogatory and answer:

> "Q. 43. Have you had any talk with them (Drawbaugh and Jacobs) about talking machines since that first visit?"
>
> "Ans. I have spoke to Mr. Drawbaugh about it—yes, sir; several times—talking about the machine and about the idea of vibration, and a certain remark he made to me in conversation; the remark was this—that he heard Mr. Samuel Hertzler's daughter play on the organ probably a quarter of a mile from his place of residence; while she was playing the organ, he took notice that there was a sound of a cut-off in that organ, just like a tap, tap, tap, a cut-off in that sound; being anxious to know what caused it, he went to Samuel Hertzler's and found a break in the window-glass; being loose, it would jar; from that he seen what the cause was of that there sound cutting off like; then he said *that that showed him that he was right; that give him an idea that he was right in his study.*" (Ans. 43, p. 437.)

Right in what—in what "study?" The talking machine? There is not a scintilla of evidence that the matter had any connection with the talking machine. Drawbaugh heard a "tap, tap, tap" in the sound of the organ, and apparently attributing it to the broken pane of glass, went to verify his conjecture, and found that he was "right." Even if Drawbaugh afterwards related the circumstance in some conversation with the witness about his telephones, it has no significance whatever—it only shows that when he observed the peculiar sound and discovered the cause of it, he regarded it as confirmatory of some *previous* theory—how long previous does not appear—years, perhaps. *If Drawbaugh had observed the fact only yesterday, he might well have made to-day precisely the same remark about it, although his telephones have admittedly been in existence years prior to yesterday.* Yet the complainants went gravely to work and proved that Samuel Hertzler never had an organ till June 16, 1875! As though that affected the history of Drawbaugh's invention in the slightest degree!—Besides, the witness is testifying to mere conversation. He may have misunderstood it, or misrecollected it. The complainants cross-examined Drawbaugh about it (D. Vol. 2, p. 1026), but he remembers nothing of the occurrence. The effort to use such worthless stuff in rebuttal of positive testimony only shows to what desperate expedients the complainants were reduced. We can clearly understand from it how little they have left undone and unsaid to meet the defendants' case, and how unproductive all the work of their corps of detectives, agents, and attorneys has been.

A few efforts were made to rebut *Daniel Drawbaugh's* testimony, as to immaterial particulars, but with no result in any way impeaching the general accuracy of his statements, even as to details. His testimony covered a period of nearly twenty years of his life, including his inventions, studies, occupation, finances, and even the particulars of his history from year to year in all that time, and, if he had made many mistakes as to small points, during his tedious two months of examination and cross-examination, the fact would have been of no material significance. But the attempt to shake his statements ended in failure.

One point on which they tried to prove him wrong was in regard to the deposition of the $400 found on the person of Miller, who was killed at Williamsport in October, 1867, (Drawbaugh, D. Vol. 2, p. 838, Ans. 460). Drawbaugh sent a man (William Darr) to Williamsport to recover the body and the money, and states in substance that, when the man returned the money, it was about one hundred dollars short, the balance having been paid out in expenses of inquest, coffin, pay of Darr, &c. Of course, he had only Darr's word for the amount and character of the expenses at Williamsport, as he himself was not there and only derived his information from Darr. Complainants in rebuttal prove that the expenses of the inquest &c., were trifling, and were paid by the railroad company and the county, and that the money found on Miller's person, $394.40, was handed over by the authorities at Williamsport to William Darr. (Swan, C. Vol. 1, p. 1020; Whitehead, Id. p. 352, 354; Broderick, Id. p. 356). Then they called Darr (Id. pp. 358-365) to prove that he handed over to Drawbaugh the money which he received from the authorities at Williamsport. We have, however, only his unsupported word for it. His last act before leaving Williamsport was the drinking of whisky (Ans. 37)—an article of which he was so excessively fond that it ruined him and his family and left him a mental and physical wreck, with his memory impaired and unreliable. (See testimony of his wife, D. S-reb. p. 109; his daughter, Mrs. Brenneman, Id. p. 103; and his daughter, Mrs. Brown, Id. p. 163). He is one of the complainants' "negative witness" who denied any knowledge of the talking machines, but was, on that point, contradicted by Peterman (D. S-reb. pp. 471-476) and also by Mrs. Darr and his daughters, Mrs. Brown and Mrs. Brenneman, and his son-in-law, Brenneman, and himself admitted, on cross-examination, the remark of Drawbaugh about talking across the Atlantic ocean, as before referred to. He evinces a disposition to swear to whatever came into his head at the moment, without regard to such trifling matters as facts, testifying in answer 10 that when the money was given him at Williamsport, "It was rolled together, and *I put a little newspaper around it;*" in answer 34 that, when given him there it was not rolled up and covered with newspaper; in answer 46 that *he didn't know who put the newspaper around it;* in answer 47, that *there was a newspaper around it when it was handed to him*, and he put another around it for greater security; in answer 45, that he didn't even know that the money was in bank bills or in any other form till Drawbaugh unrolled it; in answer 10, that when he received the money at Williamsport *he stuck it in his pocket-book;* in answer 47, that *he had no pocket-book*, and therefore just stuck the money in his pocket, etc., etc., etc. Swan thought it necessary to accompany him as far as Bridgeport, and Darr's suspicion that Swan wanted to entice him into the sleeping-car and rob him (Darr Ans. 38), probably indicates his maudlin condition at the time.

A witness of such character and habits, confessidly indulging his appetite for whisky at the very time, broken down in health and memory when on the stand, contradicting himself in his testimony, and contradicted by his whole family and Peterman on an important point in the case, will hardly suffice to shake the testimony of Daniel Drawbaugh; but even if he were right, and Drawbaugh's memory was in error as to this particular fact, which occurred more than 14 years prior to his examination, it would not in any way impair the general credibility of Drawbaugh's testimony. No man has an absolute infallible memory of every event of his life, and Drawbaugh is not held up as an exception to the rule; but only as an honest and truthful witness, giving his best recollection and belief about the events.

In the Darr matter, the complainants undertook, apparently, to show that Drawbaugh had overstated his payments in 1867, and so underrated his pecuniary resources remaining after the transaction. They called Wilson Miller (C. Vol. 2, p. 1198) to show that Drawbaugh had made a similar overstatement in his answer 592 (D. Vol. 2, p. 862). Drawbaugh in said answer testified that he paid Wilson Miller $12.20 on April 3, 1878, and took his receipt therefor, and they wanted to show that he paid only $6.31, in settlement of his entire account with Miller, on April 4, 1878. On recall, however (D. S.-reb. pp. 398-492), Miller testifies that Drawbaugh paid him both the $12.20 on April 3d, and the $6.31 on April 4th, and that the receipt is genuine. Here Drawbaugh had understated the amount paid by him, or, in other words, had testified against the interest of the defendants. The result only emphasizes the honesty of Mr. Drawbaugh's testimony, *and it peculiarly emphasizes the danger of relying upon negative evidence and mere inference to rebut* *affirmative testimony.* Nothing of a negative character could be stronger than the unexplained evidence of the book accounts, and nothing could be weaker than such evidence when afterwards explained by Miller.

As to the two notes, one of Drawbaugh & Kissinger to Leonard (Drawbaugh, D. Vol. 2, pp. 853–4), and one of Drawbaugh to Leonard (Id. pp. 860–1), Drawbaugh states (Ans. 544) that he does not know when the first one was paid, and (Ans. 546) that he has forgotten how Kissinger came to sign it. It subsequently appeared from Leonard's testimony (C. Vol. 2, pp. 1199–1205) that the first note was merged in the second, and he explains how they originated. The explanation supplies matter which Drawbaugh stated that he did not remember about, and in nowise detracts from the strength of his testimony.

The same remark is true of his testimony (D. Vol. 2, p. 1079, Ans. 1749–1751), as to payments made by him out of the old faucet money. He states positively, in answer 1749, that he did not remember to whom he paid out the money for old debts, store-bills, etc., etc. When pressed by complainants' counsel to name some one, he stated that he paid bills to Graybill & Zacharias and Natcher about that time, but did not testify positively that they were paid *at* that time nor *out of* that money. Complainants subsequently called *Lewis* (C. Vol. 2, p. 1262) to prove that Graybill entered the firm in February, 1869, and called Natcher (C. Vol. 1, p. 500) to show that his bills were paid in 1870 and 1871. In view of Drawbaugh's declared inability to specify positively the parties to whom old debts were paid out of that particular money (which was received in small sums all along from May, 1867, to *some time in 1869*—see D. Vol. 2, pp. 839–841, endorsement on notes), and of his recollection of the payments to Natcher only as being "about that time," the evidence of Natcher and Lewis amounts absolutely to nothing.

After the defendants had taken their sur-rebutting evidence, the complainants once more started out in rebuttal, aiming their efforts at two or three of the sur-rebutting witnesses, to wit, Eicholtz, Jacob Evans, Sarah Evans, and the Kahney boys. These efforts were, if anything, more futile than their former attempts.

First, they tried to attack the testimony of Jacob Evans (their own former witness) by the statement of Fisher, (C. Vol. 3, p. 2103), George Ditlow (Id. p. 2122), and E. F. Garman (Id. p. 2334), to the effect that Evans, in the summer of 1883, after testifying for the complainants and before testifying for the defendants, had stated that he didn't believe Drawbaugh ever had a telephone.

Garman was, however, immediately disposed of by proof of his bad general reputation for truth and veracity (see D. S-rej, *Baughman*, p. 243; *Buttorff*, p. 244; *Himelreich*, p. 245; *Long*, p. 223; and *Prowell*, p. 247), which the complainants made no attempt to answer. *Evans* was called in sur-rejoinder (D. S-rej., p. 163), and denied making any such remarks as were attributed to him by complainants' witnesses, and testified positively to what he did say at the time; and *R. A. Ross*, who was present at the time of the alleged conversation, corroborated Evans in every particular. The cross-examination of Fisher and Ditlow brought out many inconsistencies in their testimony, and also revealed the suggestive fact that Mr. John C. Comfort, complainants' agent and detective, was quite free in the use of money before they went on the stand,—offering Fisher ten dollars to go and see Ditlow and Garman (Fisher, p. 2114), and paying Ditlow five dollars to go and see Fisher and Garman (Ditlow p. 2142), very large wages for laboring men for an hour or two of walking and talking. Ditlow's return to the witness stand (p. 2145) at *somebody's* suggestion, to get himself out of a gross error in his testimony, is also highly suggestive. The attack upon Evans is clearly not successful, and that Evans had, before the year 1876, both seen and talked through Drawbaugh's talking machine, is overwhelming proved by a large number of witnesses in addition to his own testimony. The complainants themselves had already examined him to prove that he knew of Drawbaugh's talking machine in 1877, and now try to represent him as saying, in conversation, in 1883, that he never saw it and didn't believe it was there!

The attempt to rebut Eicholtz grew out of the fact that he stated in Answer 7 (D. S-reb., p. 153) that on November 6, 1873, when wituess was returning from Drawbaugh's shop to Harisburg, John Teahl rode along with him from Teahl's mill, where he was milling at the time. They called Calvin Etter (C. Vol. 3, p. 2074) to prove that Teahl milled at "Teahl's Mill" up to about March, 1871, but never afterwards. The reasonable explanation is that Teahl happened to be at the mill again that day, and rode to Harrisburg with Eicholtz, who, residing at some distance from the mill, and having known of Teahl's former proprietorship of it, was probably unaware of his selling out, or, if aware of it at the time, had forgotten the fact when he gave his testimony. The date, and the facts concerning his visit to Drawbaugh's shop and seeing and talking through the telephone there, are corroborated by Mrs. Eicholtz and George B. Eyster (D. S-reb., pp. 158, 890), and so trifling an error as this does not even raise a doubt as to the general accuracy and truthfulness of his evidence.

An absurd effort was made to contradict *Sarah E. Evans* as to the weather on the day of the Evans visit to Drawbaugh's shop about December 1, 1875. Several days after she left the witness stand she was recalled at complainants' request for further cross-examination (D. S-reb., pp. 86, 87), and was asked what the weather was on Sunday *evening as she was returning home* (Q. 73-76), to which she replied that it was pretty *cold* (Ans. 73), but *not snowing* (Ans. 74), and was *cloudy* but *not raining* (Ans. 76); to rebut which the complainants put in evidence the weather report for December 5, 1875, printed in the Harrisburg newspapers of December 6 (C. Vol. 3, pp. 2398, 2399), which referred to "disagreeable, cold, incessant rain of yesterday" that "kept many people indoors" in Harrisburg, and to the northeast winds, fog and rain which "prevailed" from the Middle States to the Mississippi. But the Evanses went home from Milltown to Dillsburg late in the afternoon, starting about three or four o'clock and arriving home after dark, and it may well have been a cold, rainy day, but, at that late hour, only "cold" and "cloudy," as Sarah testified. The visit, the date, and the facts that occurred that day at Drawbaugh's shop, are attested by too many witnesses, and in too clear and convincing a manner, to be affected by such loose statements as those of the Harrisburg newspapers.

The complainants made an equally ludicrous effort to rebut the the testimony of the Kahney boys by calling their father, John Kahney (C. Vol. 3, p. 2034), and Henry Neidig (C. Vol. 2, p. 1520), to prove that those witnesses never heard the Kahney boys say anything about Drawbaugh's talking machines. Such stuff as that, to rebut the positive testimony of the four brothers, one of whom was the complainants' own witness, corroborated by another unimpeached witness, Basehore.

To appreciate the utterly worthless character of such testimony, see the depositions of complainants' witnesses, A. L. Rupp and George C. Rupp (C. Vol. 2, pp. 1111, 1122), who swear that they separately visited Drawbaugh's shop and talked through his talking machines in the winter of 1877-8; yet, although they had lived together in the same family, neither knew, until about the time of their being called as witnesses, that the other had any knowledge of the talking machines.

The attempt to answer the defendants' evidence by such trash indicates only that it is unanswerable.

It is certainly no exaggeration to say that the efforts of complainants to specifically rebut or shake the testimony of the opposing witnesses have merely resulted in materially strengthening the defendants' evidence. The fact that, with all their resources of time, money, and zealous agents dwelling right in Drawbaugh's neighborhood, they have found so few witnesses open to *any* attack, and have, even as to those few, so signally failed, speaks volumes in favor of the integrity of their opponents' case.

The complainants having thus failed to shake the defendants' case by their negative evidence, and having broken down in their sporadic attempts at specific rebuttal, they have absolutely nothing left to oppose to the defense of Drawbaugh's priority of invention except a few *inferences*—mere arguments, based upon what he did not do with his invention. These we will now proceed briefly to consider.

3. THE COMPLAINANTS' ARGUMENTS AS TO THE CONCLUSION TO BE DRAWN FROM DRAWBAUGH'S NOT PATENTING HIS INVENTION, NOR INTRODUCING IT INTO COMMERCIAL USE, NOR ANNOUNCING IT IN PRINTED PUBLICATIONS, PRIOR TO BELL.

The defense of *prior invention* is made out by proof that the invention was made and was capable of operating, or was successfully operated, even if only experimentally, before the patentee's date of invention. The law does not require that the prior invention should have been patented or introduced into public use, or described in printed publications—satisfactory proof of its prior *existence* is all that is needed to render the defense complete. This defense, therefore, differs radically from the defense of two years' prior *public use*, which is not supported by proof of mere experimental use, but on the contrary, requires that the article should have been on sale or in use for exhibitional or business purposes, and must be pleaded and proved in a different manner altogether. *Kelleher* v. *Darling*.

The argument of the complainants, therefore, is not that the patenting of Drawbaugh's talking machines, or their manufacture and sale, or the publication of notices of them in the public prints is essential to complete the defense of prior invention; but, on the other hand, that by reason of his not doing any of these things, there arises an *inference* that he did not have the invention prior to Bell. In other words, they say it is incredible that he should have had the invention and yet left thess things undone.

To this argument we put in, at the outset, a general demurrer. Let the court give it its full force and effect, *and it does not show that the story is incredible.*

When more than two hundred witnesses testify to the fact of Drawbaugh's prior invention of the electric speaking telephone, something more than *inference* and *argument* is necessary to overthrow their testimony and convict them all of perjury. Many things appear incredible simply through our ignorance of all the facts and surrounding circumstances, *or more often from our preconceived prejudices on the subject in question.* When we attempt to balance probabilities, and throw our *prejudices* into the scale, the result is necessarily erroneous.

Balancing the probabilities in this case, without prejudice, which is the more incredible, that, on the one hand, Drawbaugh should have been operating and exhibiting the invention for years prior to Bell, without patenting, manufacturing or announcing it through the public prints; or that, on the other hand, more than two hundred witnesses to his invention prior to February 14, 1876, should have mistaken the facts or testified falsely? These witnesses for the defense are from all parts of Pennsylvania, and even from distant States; they are from every station in life, ex-congressmen, ministers of the gospel, college professors, lawyers, doctors, merchants, mechanics, manufacturers, farmers, laborers, railroad men, clerks, &c., &c.; they are persons of the highest character and standing in their several communities, so far as truth and veracity are concerned—not in a single instance has this fact been even questioned in the complainants' proofs; and many of them never were in Drawbaugh's shop after June 1, 1875, nor even for a considerable time prior to that date; —now which theory is the more incredible,—that they could all be wrong, or that the complainants' inferences and suspicions are unfounded and unreliable? Does the history of all the courts in the world exhibit a solitary instance where such an array of testimony was ever overthrown by *inferences* and *arguments as to its incredibility?* Can the Court find a case where two hundred witnesses have gone wrong, and all the skill and ingenuity of able counsel and zealous detectives, having abundant financial resources and years of time for investigation, have been unable to demonstrate their error? Can the Court conceive the possibility of so vast an array of witnesses scattered all over the country, blundering into the same error without collusion, or, on the other hand, can it conceive the possibility of their being in collusion? Was Draper in collusion when he told the complainants the same story before the defendants ever had seen him or known of his story? Were Spafford and McHenry, who had never seen Drawbaugh nor been at his shop, in collusion? Was Professor Heiges or Rev. John H. Young in collusion with defendants?

Were the Hon. Richard J. Haldeman and his wife (the daughter of Simon Cameron) in collusion with the defendants? Were David Stevenson, Jr., and the two Gregorys in collusion with defendants when they told the complainants the same story in advance of any communication with the defendants?

These general considerations alone are an absolutely conclusive answer to the complainants' inferences. But they are not the only answer. Each one of those inferences is shown by the proofs in the case to be practically unfounded, and to a brief consideration of this fact we will now devote our attention.

In order that we may not mistake the complainant's inferences, we will give them in their own language, quoting from one of their briefs below. They there recapitulate their inferences and arguments as follows:

RECAPITULATION.

"1. Drawbaugh's claims were first made public in 1880—when Bell's patent was four years old—and thousands of telephones made under it were in public use.

"2. The publication of Drawbaugh's claims at that late date was not his own doing. He was dragged to light by infringers of the Bell patent in need of a defense.

"3. Although Drawbaugh claims to have had operative speaking telephones as early as 1867, no patent was applied for, no caveat filed, until 1880; nor was his alleged invention used except in his own shop, and experimentally.

"4. Bell's invention was given to the world in 1876, and before the close of that year had attained world-wide notoriety. Before another year had gone by the invention was in extensive public use. This was known to Drawbaugh, yet he made no sign, even in the public prints. Such silence, under such circumstances, is irreconcilable with the truth of his present story.

"5. He was not a man unnoticed or unknown. He kept himself before the eyes of his community as an inventor. He exhibited at public exhibitions. He was mentioned in the newspapers. He had occasion both before and after Bell's patent to enumerate the works on which he rested his claim to be an inventor. But the invention of the speaking telephone was not among those alleged creations which he enumerated or which others attributed to him.

"6. The proofs show that the allegations made in defendants' pleadings as to Drawbaugh's abject poverty and lack of means and facilities for experimenting, are essentially untrue, and that, on the contrary, during all these years in which he claims to have been in possession of the invention, his situation and opportunities for developing it —if he had it—were exceptionally favorable. During that very time he was holding himself out to the public as a machinist whose specialty was 'electrical' machinery; as a solicitor of patents, etc., etc.; and it appears that he had, in fact, all the mechanical skill and all the tools and appliances for making that skill available for the ready production of speaking telephones—if only he had possessed the invention. That he did not give the speaking telephone to the world was *not* owing either to poverty or to lack of mechanical skill or appliances.

"7. Nor was it owing to lack of moneyed persons willing to interest themselves in such an invention. The proofs show that Drawbaugh's neighbors were only too ready to invest their means in schemes of his devising, and the inference is irresistible that if he did not interest moneyed neighbors in a 'talking machine' it must have been because he did not seek to do so, or more probably because he had no 'talking machins' fit to attract their attention."

Let us consider these assertions in their order:

Paragraph 1 needs no comments further than this—that Drawbaugh *did* make his claims public *to his community*, long before Bell's invention. His machines, and the knowledge that he claimed them to be his invention, and novel and valuable, were no secrets, but were known all around that part of the country. It is in evidence not only that they were known to the hundreds of witnesses who have affirmed their own knowledge of them, but also that they were generally known and talked about through that region. This is making his claims public, in the sense of the patent law, just as much as any other mode of asserting them.

Paragraph 2 would be inconsequential if true, but is not true, as we have just shown. He was not dragged to light by infringers, but the fact that was already well known in Cumberland county, Pa., and to many persons outside of that county, reached the knowledge of these defendants also, and they then sought to make a perfectly legitimate use of it in defense of the complainants' invalid and worthless patents.

Paragraph 3 has been already practically answered in this brief, by an explanation of the reasons why Drawbaugh did not patent, nor manufacture for public use, his invention. For the first two or three years he considered his invention as experimental and needing improvement. During this time, he had no reason to suppose that when it became satisfactorily completed, he would be too poor to do anything with it, or that, if he should be, others would fail to appreciate its commercial value and come to his aid. By the time when this experimental period had passed, in 1870, or thereabouts, he was in utter poverty, and remained so until 1880. He tried to induce others to accept one-half of the invention and patent and introduce it, but they, like Gardiner C. Hubbard and others in Bell's case, looked upon it as having no commercial value, and declined their efforts to induce others to take hold of it, continued all along till after the introduction of the Bell telephone, when there came into existence another strong element of discouragement to investors, viz.: fear of litigation with the owners of the Bell patents. It is undoubtedly the fact that, during considerable periods, prior to 1877, Drawbaugh was expecting parties to go in who, like Baylor, Herr, Draper, Snyder and others, seem to have held the matter for a while under advisement, and to have finally declined, not formally, but by mere delay and neglect to act. He did not manufacture the machines for public use because he he had no means, and because he did not propose to render his invention public property, but intended first to patent it and afterwards to put it on sale.

Paragraph 4 is equally inconclusive. Drawbaugh was not a learned man, a lecturer, a writer, like Bell. He was not given to newspaper controversies, and probably never wrote an article for a newspaper in his life. He was conscious of his illiteracy, sensitive and diffident, and, by the time when he knew of the introduction of the Bell telephone, found himself already face to face with a powerful moneyed interest which had the ear of the public and had skillfully entrenched itself in public opinion. His poverty he felt to be an insuperable obstacle to any scheme of opposing, single-handed and alone, so potent an adversary. A man of bold, aggressive character, quick to push himself into the public gaze, readily grasping the financial possibilities involved at that time even in a public proclamation of his right, would, probably, have done otherwise; but the acts must be judged by the man, and by his circumstances. Drawbaugh was not that kind of a man. He did not abandon his right, nor lay aside his invention, nor desist from importuning others to take hold of it with him and furnish the means for establishing his title. Without knowing Bell's or Edison's date of invention, he frequently declared to others that he believed himself to be the prior inventor, as he had been a very long time engaged in the work. (See H. F. Drawbaugh, Chellis and complainants' witnesses, Matthews and Weaver.)

Paragraph 5 is a tissue of misrepresentations, and of other statements which, while literally accurate in terms, are false in their suggestions. In a certain sense, he "kept himself before the eyes of his community as an inventor," and, it should have been added, *as the inventor of the talking machine*. It is *not true* that he ever "exhibited at public exhibitions;" he merely superintended an exhibition at Harrisburg in 1868, and again in 1869, for the owners of his pump invention and his nail machine invention; and, in 1878, for the owners of the electric clock invention; and with their money, not his own. It is true that he was "mentioned in the newspapers," but not by his own procurement. The statement that "he had occasion, both before and after Bell's patent, to enumerate the works on which he rested his claim to be an inventor, but the invention of the speaking telephone was not among those alleged creations which he enumerated, or which others attributed to him," is not broadly true. He had no *occasion* to verify his claim to be an inventor by enumerating the works on which he rested that claim, nor is there the slightest evidence that such a thought was ever in his mind. We should be at a loss to understand what the appellees' counsel mean by this allegation, were it not for the antecedent statements in their brief from which it has been copied, where we learn the following:

First. That in January, 1869, he agreed to give the pump company the gas-governor that he was then preparing, but did not agree to give them the talking machine. Verily, this is a powerful argument! Possibly he did not *wish* to give them his most valuable invention "on conditions to be agreed upon hereafter." Possibly he did not consider it ready, at that early date, to be put upon the market. Possibly the company, like Mr. Gardiner G. Hubbard in 1875, did not believe in the commercial value of an electric talking machine, and did not wish to manufacture it. A dozen good and sufficient reasons can be suggested for his not giving it to them, all consistent with the theory that he had it and valued it highly.

Second. We are informed by the same brief that in March, 1869, the pump company wanted him to get up a *screw-machine* for the use of the shop and its benefit. What in the world has that to do with the existence or non-existence of his talking machine at the time?

Third. We also learn that the Faucet Company had a bill head printed in 1870, which enumerated a list of the machines they were manufacturing and selling, and it did not include the talking-machines. Certainly not; why should it? He had not given them the right to manufacture the talking-machines, and they were advertising only their own manufactures.

Fourth. It is stated that, in the summer of 1874, he had some advertising cards printed by Holsinger, which enumerated a great many different inventions, but did not enumerate the talking-machines. This card was proved by Holsinger, who swore at the same time that he had knowledge of Drawbaugh's talking-machines prior to that date. It was evidently written by Holsinger, and not by Drawbaugh, as appears from the inaccurate expression, "*inventor* of the following *patents*," an expression not likely to have been used by Drawbaugh, and also from the inaccurate description of the magneto-electric machines as a machine for "fire alarm and propelling electric clocks," with neither of which did it have anything to do, nor was it applicable to them in any way. It did not profess to give the list, as a list, of *all* Drawbaugh's inventions, *nor was it such a list in fact*, for, besides omitting the talking-machines, it omitted the *stamp cancellers*, the *steam syphon pump*, the *automatic boiler-feed*, the *pressure blower*, the *tack machine*, the *machine for wrapping wire*, the *weather indicator*, and the *gas governor*, all proven, even by the complainants' witnesses, to have been in existence prior to that date. *Why* these various inventions were omitted we are not informed; but we *do* know, on the complainants' own evidence, that the fact of their omission from that card is no more true than the fact of their existence at and prior to that time. Both facts were true, and, therefore, both were consistent with each other. In like manner, the fact of the existence of the talking-machines, at and prior to that date, is proven, and their omission from the card does not, by implication, negative the proof any more than the omission of the other negatives *their* conceded prior existence. The inconclusiveness of negative evidence, and mere inference, as applied to the one, is proved by its worthlessness as applied to the others. Whoever wrote the card, he was clearly *not* giving a list of all of Drawbaugh's inventions, a fact which deprives the complainants' argument of its sole foundation. Even if the card had assumed to give a full and complete list, it was open, like a receipt, to correction and explanation by oral evidence, but it assumed no such thing—it is only the complainants' *argument* which assumes such fact.

The complainants may try to break the force of this answer to their inferences, by arguing that the other omitted inventions were not considered worth mentioning in the card; but this, again, is mere assumption—no such explanation is proved in the record. As an argument it concedes the *fact* that the card was not intended to, and did not, give a full list of all the inventions that he claimed at that period to have made; and concedes that the inventions which were thus designedly omitted from the card were omitted for *some* good and satisfactory reason; and then coolly assumes the reason. And the alleged reason, when we consider it, is found to involve assumption upon assumption, to wit: first, that the omitted inventions were considered of no value, which is not proved of any of them, *and is expressly disproved as to the talking machine;* secondly, that they were all omitted for one and the same reason, which is not proved; and thirdly, that the complainants have hit upon the correct reason, which, also, is mere assumption. The complainants' argument thus begs the question, by assuming the facts upon which it is based; it then asks the Court to disregard the evidence which disproves the correctness of such assumption, especially as to the talking machines; and, finally, it *begs the conclusion.*

Seeing the absurdity of this position, the complainants may try a different hypothesis: They may say that, perhaps, that the card did not enumerate the talking machines because they were incomplete and only experimental.

This explanation if offered, *sets out by conceding that Drawbaugh had talking machines in and prior to the summer of* 1874, and tries to mitigate the force of this fact by *assuming* them to have been inchoate, incomplete and unsatisfactory at that time. In other words, it begins by corroborating the defendants' witnesses as to the vital fact in the case, and assumes all the rest. If, after all their efforts to prove the contrary, the complainants are obliged to admit that Drawbaugh had electric talking machines, of *any* kind, in the summer of 1874, who can believe them when they now become reduced to the mere *assumption* that those machines were not satisfactory? In granting the correctness of the defendants' witnesses, as to the main fact, they greatly strengthen their probative force as to the accompanying facts testified to by them.

But the assumption that the machines, so admitted to exist, were unsatisfactory and incomplete, is conclusively destroyed by the evidence. The instruments are shown to have been F, B, C, I and A, of which the latter, at least, is one of the "highly organized" instruments referred to by the complainants' counsel in the Overland Case. Moreover, the evidence of Waggoner, Hubler and others, shows that at that time Drawbaugh considered and declared the invention to be substantially completed and perfected. The evidence of scores of witnesses shows that it was capable of transmitting and reproducing articulate speech at a distance by electricity; and the evidence of Herr, Baylor, Draper, C. Eberly and many others shows that Drawbaugh was then, and had for some time been, endeavoring to get capitalists to take hold of it with him and patent and introduce it. If he had such machines at all, which this argument concedes, the evidence conclusively proves these facts in regard to them; and no mere assumption of the complainants can diminish its effect. This attempt to assume a reason for omitting them from the card is, therefore, a failure.

The probable reason is that, inasmuch as Drawbaugh considered the invention to be of great value and the crowning work of his life, and found himself unable to secure capital at present to patent and introduce it, and did not wish to have it stolen from him, nor to have it get into public use till patented, he may not have considered it wise to advertise it. This theory is consistent with all the evidence, and his conduct in so doing must be conceded to have been reasonable and proper under the circumstances.

This reason is consistent with the proved facts, and is, at the least, quite as satisfactory as the assumptions of the complainants, which are not consistent with proved facts.

But the one fact alone, to wit, that the list does not purport to give all his inventions, and that several inventions conceded to have been made by Drawbaugh prior to the summer of 1874 were omitted from it, is a sufficient answer to the whole argument, which, as stated in their recapitulation in the Overland brief, rests upon the assumption that he had occasion to give, and did give, a list of *all* his inventions made at or before that time.

Fifth. To support the same paragraph of the complainants' recapitulation, we find it argued in their said brief, that Drawbaugh's answer to a question in the Hauck interference in 1879, negatives the testimony of the defendants' witnesses. The opposing counsel in the interference was endeavoring to clear the ground for a possible argument that Drawbaugh was a man who could conceive, but not perfect, an invention, and, in the course of his cross-examination, the following question and answer occur:

> "Cross-Q. 104. *Since* 1866, what machines have you conceived and perfected that have worked satisfactorily?"
>
> "Ans. To the best of my knowledge, *I think that they all have.* The nail machine gave satisfaction. I had it running in the works, but the nailers drove me out. The tram and red staff was a good machine, and adopted by a number of millers, and acknowledged by them to be a good machine. The magnetic clock I considered a good thing, but I am not through with experiments on it. I believe this last faucet is a good thing."

Now, examining the question put to the witness, it will be seen that it does not include the talking machine, which was conceived prior to 1867, but only such machines as were conceived "since 1866," that is to say, in 1867 or subsequently.

Again, the witness' answer shows conclusively that he did not feel called upon by the question to set forth a *list* of his inventions. Accordingly, he answers the question in one line: "To the best of my knowledge I think they all have." That was a complete answer to the interrogatory, disposing, in one sentence, of the whole matter of the inquiry. Having given this answer, it evidently occurred to his mind to mention some of his machines *which had notoriously been in public use and on sale*, and of the acknowledged merits of which his interlocutor must be aware. He therefore specifically mentions *four* inventions out of the large number which he had made during the period of the inquiry. He did not even specifically mention all the machines which had been in successful public use, such as the faucet and pump which the Haucks themselves had been making and selling for six years, nor the carpet-sewing instruments of which many had been sold for years, nor the grape-stemming machine which Hertzler had been successfully using in his business, nor many others that he might have referred to in the same category. He carefully excluded from specific mention all that he had simply used for experiment or exhibition in his shop. And he concludes by expressing his opinion of the machine then in controversy. That this is the meaning of his answer, is evident from even a cursory examination of it, and the attempt to distort it into a piece of negative evidence is without justification by the facts. At that time, *June*, 1879, Drawbaugh had many elaborate and excellent telephones in his shop, on the complainants' own evidence, and, a year before, had claimed to have invented both the battery and magneto instruments, as appears in the "History of Cumberland County."

Sixth. As another ground for the fifth point of the complainants' recapitulation, we find in the body of said brief, that in 1876 Drawbaugh had a bill-head printed in which he used the following terms: "Daniel Drawbaugh, Practical Machinist, *Small machinery, patent office models, electric machines, &c., a specialty.*" But this is no list nor "enumeration" of his inventions, and does not in the least tend to support the complainants' argument as stated in their recapitulation.

Seventh. In their said brief the complainants do not attempt to cite any other instance than those above given, as an instance where Daniel Drawbaugh "had occasion" "to enumerate the work on which he rested his claim to "be an inventor," with the single exception of the list given in "Wing's History of Cumberland County," and made up from materials procured by the publishers, through Hull and Nesbit, in the summer of 1878. Here they attempted to prove a negative by putting in evidence an extract from a book known to be incomplete; and, when foiled in this commendable enterprise to misrepresent Mr. Drawbaugh, they are obliged to admit that he *did* enumerate the telephones, both battery and magneto, as his invention. And what is their answer to this fact? Merely that Mr. Hull, in making up his manuscript, didn't couch the statement in such language as they think would have been used if Mr. Drawbaugh had assumed to be the first inventor. Hull's statement is as follows: "He is "the inventor of the justly celebrated electric clock, *and* "*of several kinds of telephones, one of which is operated by* "*a battery, and the other by induction.*" This language is not justly subject to the criticism referred to, even if it were Drawbaugh's language; but it is Mr. Hull's language. Drawbaugh is clearly not responsible for the form of expression used by Mr. Hull in attempting to state the facts which he had learned from him. The criticism is an abortive effort to impair the force of the fact that Drawbaugh claimed to be the inventor of both kinds of telephone, after having vainly endeavored to prove that he did not mention the telephones to Mr. Hull, and being caught in the very act of misrepresenting him and trying to deceive and mislead the court. It is a case of very sour grapes. Besides, Drawbaugh's claiming or not claiming priority, in that particular interview, is not material. Probably the subject of priority was not discussed, and, if it was discussed, Hull may have omitted all reference to it.

Having thus seen that the facts do not at all support the allegations contained in the fifth paragraph of the complainants' recapitulation, let us see if the sixth fares any better.

Paragraph 6 is like paragraph 5, a mere inference, based upon gross misrepresentation of the proved facts. The defendants' allegations as to Mr. Drawbaugh's extreme poverty, have been conclusively proved, as we have already shown elsewhere in this brief. The complainants' allusions to Drawbaugh's alleged "exceptionally favorable" facilities for developing the invention—"if he had it"—are utterly inconclusive, even if the assumed fact were true. He *did* develop the invention, facilities or no facilities, and the question what kind of tools he did it with is of no importance. The fact *that he did it*, cannot be disproved by showing that he had the requisite tools to do it with, even if it be shown that the defendants, in their answer to the bill, were in error as to the character of his tools at the time. Drawbaugh testifies that he does not think his tools were the best that could be had for the purpose, but whether he had or not is utterly immaterial in view of the fact that he made the machines and made them talk—"highly organized" machines, too, as the complainants say.

But let us see if the complainants do not misrepresent the fact here also. Up to July 1, 1873, Drawbaugh had the use of the old Faucet Company's tools and machinery. These were special tools, adapted to making faucets, and not to electrical machinery at all. From 1873, to May, 1876, these tools belonged to the Haucks, and Drawbaugh had no right to use them. In May, 1876, they were removed from the shop. From March, 1875, to some time in the fall of 1876 the Axle Company's tools were at the shop, but they, too, were special tools, adapted to making axles, and not to electrical devices, and Drawbaugh had no right to use them. When afterwards the Clock Company sought to make electrical clocks, they had to procure new machinery and appliances. It is undoubtedly true, on the evidence, that Drawbaugh's tools, adapted to his electrical work, from 1866 to 1878, were for the greater part, only such as he himself made for his own use, just as he made the machine for winding his spools or electro-magnets, and for insulating his wire. The fact that he solicited electrical work from others does not disprove this, nor detract from its force. He had to make a living; was interested in that kind of work, and did it the best that he could, relying upon such tools as he had.

But it is further argued, in the same connection, that the testimony of Drawbaugh and more than two hundred other witnesses is not to be believed because he advertised himself in the Holsinger card heretofore referred to, as *a solicitor of patents.*

This, however, is all explained by Drawbaugh in exact accordance with the proved facts, and his explanation is reasonable and conclusive.

It appears from his evidence that other illiterate inventors around in that region had gotten into the habit of coming to him and consuming his time in getting him to write out a rough description of their inventions, in order to assist their patent solicitors afterwards in making up their application for the Patent Office, and that he found himself able thus to make a small fee occasionally. (D. Vol. 2, pp. 863–4, 896.) In one or two instances, where the inventions were simple and easily described and claimed, his descriptions appear to have been considered good enough to be filed in the Patent Office by the inventors. He says, however, that he considered himself incompetent to draw good specifications; and can the Court have any doubt that this opinion was correct? If it has, let it look at his correspondence, so far as it is in evidence, as for example, in the letter to Kahney (D. S.-reb. p. 245), for confirmation of the fact. He says that he never appeared in the Patent Office as a solicitor for himself or anybody else, which statement is conclusively confirmed by the Patent Office certificate printed on p. 775, of the defendants' surrebutting evidence; and that his attempts to draw specifications were, in almost all instances, revised by some patent solicitor. Why did he consider it thus necessary to have his work revised by others before filing it in the Patent Office? Why did he never file the applications himself and conduct the correspondence with the Patent Office? Why did he *always*, when patenting any of his own inventions, deem it necessary to procure a regular solicitor other than himself? These things show that his explanation is strictly truthful and accurate. Can it be assumed that, when he felt himself incompetent to solicit a patent upon his own faucet or earth battery or other simple and comparatively valueless machine, he could, for a moment, have trusted himself to draw the specifications and claims for that invention, which was at once the most important of all, and the most difficult to properly describe and secure by letters patent? The question answers itself, and the complainants' criticism and argument fall to the ground. If he had drawn his own patent, he would most assuredly have lost his invention. There is not one chance in ten thousand that he could have drawn a claim to the "method and apparatus" for transmission of speech by undulatory currents that would have stood the tests of law. His judgment in the matter is rather to be commended than criticised. That he should have had the vanity to attempt to trust his own unskilled hand and ignorance of legal principles in such a work, is far more incredible than that he should have waited from month to month for his arguments and exhibitions of the work of his machines, to bring capitalists to his aid and enable him to secure competent legal assistance in procuring his patents.

Paragraph 7 is of the same general character as the others in its gross misstatements of fact and disregard of the evidence. The proofs do *not* show that Drawbaugh's "neighbors were only too ready to invest their means in "schemes of his devising," but the contrary. True, eight of them invested in his faucet in 1867, but their losses in that enterprise undoubtedly discouraged both them and many others from afterward taking any interest in his other inventions.

So, too, Christian Eberly took an interest in five of his earlier inventions prior to 1870, but declined to take an interest in the talking machine, although urged to do so. (D. Vol. 1, p. 115–6.) When asked who furnished the money for those five inventions, he answered: "I "furnished all the money, for I don't recollect of him "ever having any money; it's true." And Mr. Eberly's experience, together with his own pecuniary embarrasment, afterwards undoubtedly prevented him from investing money in any business founded upon a patent. The Axle company, manufacturing under the patents of Kline, from March, 1875 to the spring of 1876, was a financial failure (Moore, D, Vol. 1, p. 625, Ans. 47), and its ill luck tended to discourage local investment in similar enterprises. From September, 1873, till as late as 1877 or 1878, it will be remembered, was the period of "contraction," in which the starting of any new commercial or manufacturing business was a matter of doubtful issue, and, as a consequence, capitalists were everywhere cautious about making such investments. In 1876, Shapley, of Mechanicsburg, talked about taking hold of the electric clock invention, but it amounted only to talk; when the time arrived for putting up his money he backed out. In 1878, Shettell and the Grissingers went into the clock enterprise through the influence of Shettel, who, years before that time, knew of the successful working of the talking machine, but, like Gardiner G. Hubbard and Thomas Sanders, and even Elisha Gray, saw no money in it. And it is abundantly proved that, had his neighbors been "only too ready to invest their means in schemes of "his devising," Drawbaugh would have patented his telephone invention long before the public ever heard of Alexander Graham Bell.

The argument *ab incredibilitate* is always to be received with caution when the thing to be proved is physically possible and is vouched for by many witnesses of unimpeachable character testifying from personal knowledge.

In this case the thing to be proved—the invention of the electric speaking telephone—was physically as possible on Drawbaugh's part as on the part of any other man, although it was not known to be possible until actually achieved by somebody. It was as possible of Drawbaugh as of Bell or Gray. Bell testifies that he himself was hindered and embarrassed by poverty and by the incredulity and opposition of his financial backers, Hubbard and Saunders. The proof shows conclusively that Drawbaugh's financial situation was much more serious than Bell's, and that his distress extended through a much longer period. It also shows that Bell did not experience a tithe of the incredulity that Drawbaugh suffered at the hands of timid financiers. There is, therefore, no greater incredibility in the facts stated and proved on behalf of Drawbaugh than in the facts stated and proved on behalf of Bell. In view of this fact, we submit that the immense array of testimony proving Drawbaugh's prior claim is to be received with its full probative force, just as a similar array of evidence would certainly be received in any other case.

The following facts alone dispose of the whole argument:

FIRST. *The origin of Drawbaugh's telephones is to be accounted for.* When did they begin, if not as stated by Drawbaugh himself and the multitude of witnesses who confirm his story? In considering this question, let us look at the complainants' own testimony. Shapley and Landis swear that they saw instrument B at his shop on October 3, 1876, and prove that he then said he had already talked through it, and that it was going to revolutionize the world. *But he could not talk through B alone*, nor was B a transmitter, but only a receiver. What did he have for a transmitter? And how many did he have? And how long had he had them? These questions need an answer, but no answer can be found except in defendants' evidence. The complainants apparently expected to prove that Drawbaugh got his ideas at the Centennial, but he never was at the Centennial until after October 15, 1876 (Geo. Leonard, D. Vol. 2, p. 697, Ans. 14).

This was at least two weeks after complainant's witnesses swear that he had the telephones at his shop, to their personal knowledge, and that he claimed to have been talking through them. What transmitter had he used in thus talking through B? Was it F? *If so, he certainly had not gotten the idea of F from anything that Bell had done*, for F involved the great invention of the carbon transmitter, of which Bell is shown to have had no conception. Was it C or I? If so, he had not gotten the idea from Bell, for they were magneto-telephones, *polarized by permanent magnets*, and Bell did not make that invention till November, 1876, nor publish it till January, 1877. Was it A? If so, that is a "highly organized" machine, as the complainants admit in their Overland brief, and was far in advance of anything that Bell had produced at that date.

Was it another B? If so, that involves the assumption that he had another B, which is not proved, and also the admission that two instruments such as B could intelligibly transmit and reproduce articulate speech, which the complainants have made desperate efforts to negative. Then what was it? All the defendants' witnesses prove that F and B were, in the early stages of the invention, used together, the former as a transmitter, the latter as a receiver, and this fact must be considered as settled by the evidence. *Then, where did Drawbaugh get his idea of F, and when?* It involved the great invention of the carbon-transmitter, and its origin is to be accounted for.

We thus see that the complainants' own evidence raises a question which they cannot answer, except in such a manner as to confirm the defendants' case. And what are we going to do with that great number of defendants' witnesses who were never at Drawbaugh's shop after June 1, 1875, but before that date saw and talked through not only B and F, but also C, I, A, D and E?

SECOND. The testimony of Hon. Richard J. Haldeman and his wife demonstrates conclusively that, in the summers of 1868 and 1870, Drawbaugh had electric talking machines for transmitting articulate speech to a distance. Mr. Haldeman saw the instruments and the wrapped wires extending from the shop window to some building outside, and was convinced from what he saw and heard that the problem was solved. His wife says that he told her, in the summer of 1870, that on his visit to the shop in 1868 he had actually talked through the instruments, although, when he was on the witness stand he had himself forgotten whether he talked through them or not. Undoubtedly his statement to his wife in 1870 is to be taken as correct.

The evidence of these two witnesses having thus established the great facts that the invention of Drawbaugh was an electric telephone for transmitting articulate speech to distant points, and that it was made before 1870, it only remained to show what the early instruments were. This proof is supplied in the testimony of such witnesses as Emanuel K. Gregory, who assisted Drawbaugh in his experiments between March and December, 1870, and was never in the State of Pennsylvania after the latter date till he was called there to testify in this case. He identifies F and B positively as the instruments which he then assisted to operate on many different occasions, and testifies positively to their successful experimental operation. These three witnesses, therefore, Mr. and Mrs. Haldeman and Emanuel K. Gregory, whose testimony cannot be doubted or questioned, establish the date at which the instruments seen by the appellees' witnesses, Shapley and Landis, on October 3, 1876, came into being. And these witnesses are fully corroborated by several hundred other equally reliable witnesses.

Is there, or can there be, any answer to this unprecedented array of positive evidence?

THIRD. Outside of the positive evidence of the instruments, their character and their successful operation, it is abundantly proved that all along from about 1870 or 1871, Drawbaugh was constantly declaring to people of all classes and conditions that he had invented talking machines which transmitted speech to a distance—any distance, he was in the habit of saying—by electricity; was inviting all classes of persons to examine the machines and witness their operation; was seeking the aid of capital to patent and introduce the invention; and was declaring it completed and successful. These declarations and acts are proved facts, and are to be accounted for. How can they be explained consistently with human reason and the laws of evidence, except upon the appellants' theory of the case? In the face of *such* facts, what force is there in the mere groundless assertion of appellees that the instruments *must* have been incomplete or unsatisfactory, or else he would have patented and introduced them? The very facts, themselves, negative this far-fetched inference, and establish the counter-inference that there was some other controlling factor that prevented him from carrying out his plans, and suggest that it was because the capitalists whese aid he sought failed to come to his relief. The testimony of Major Snyder (D. Vol. 2, pp. 513-4) and his son (Add. Proofs, p. 160) and neighbor, Mr. Eby (Add Proofs, p. 179), is conclusive of the fact that such aid was sought before June 19, 1873. The whole evidence shows conclusively that this is the correct explanation of the failure of Drawbaugh to patent and introduce his telephones long prior to Bell.

EXTRAORDINARY METHODS ADOPTED BY APPELLEES IN MAKING UP THEIR CASE.

The extraordinary methods of the complainants in prosecuting this case ought to be looked into and strongly condemned by the court. The most unscrupulous means have been resorted to at every point to prejudice the defendants and mislead the court.

1. As early as October 22, 1880, as we learn from their agent's (Harris) letter of that date, (C. Vol. 1, p. 480) they entered upon a deliberate plan of tampering with witnesses for the purpose of modifying or affecting the testimony which they might afterwards give.

2. They pursued this plan to the very end of the case, importing at the last extremity a new and more skillful agent from Boston, to carry on the work with the ram witnesses at and around Marysville. This effort with the ram witnesses is fully discussed in our Appendix A, where its outrageous character is strongly shown. They employed every means within their power to mislead the defendants' witnesses after they had left the stand, and to get them to return and change their testimony—arguing the case with them, reading them garbled evidence, misrepresenting the proofs, appealing to their sympathies,

and leaving no stone unturned to effect their object. These facts are clearly established by the evidence, and it is probable that we are not informed, as yet, of one-half of their work in thus tampering with our witnesses.

3. They attempted to palm off upon the court an incomplete copy of Wing's History of Cumberland County, as evidence that the work contained no reference to Drawbaugh's telephone invention, when they must have known that the complete work *did* contain such reference.

4. They, in like manner, attempted to palm off upon the court a statement purporting to be made up from the County records of Cumberland County, as evidence that no footbridge was repaired or rebuilt on the Yellow Breeches Creek in 1873; when they perfectly well knew that the county had nothing to do with footbridges, and that the absence of any allusion to them in its records meant nothing. Their agent, John C. Comfort, a resident of Cumberland County and dwelling on the banks of the Yellow Breeches (see Map, in evidence), could not have been ignorant of the fact that footbridges were township property, nor of the fact that the great flood of 1873, which they tried to disprove, actually occurred as alleged by the defendants' witnesses. (See Appendix B at the end of this brief.)

5. They undoubtedly misled their witnesses, Joseph Ditlow and Abraham Ditlow, as to the date when those witnesses first knew of Drawbaugh's talking machines, by exhibiting to them a railroad shipping receipt, dated in 1877, when they must have known at the time that the railroad books would show the box to have been shipped in 1874. (See tesfimony of Isabel and Harmon Hardesty, D. S-reb. pp. 483 and 493.)

6. When interviewing the Ditlows, in Indiana, upon

being assured by one of them that he had seen some instrument which they produced, they tried to influence their memory by declaring that it never was in Drawbaugh's shop at the time stated to them by the witness. (See Joseph Ditlow, D. S-reb., p. 523, Ans. 17.) And they instructed both of these witnesses *how to put things positively in giving in their evidence.* (*Id.* Ans. 20.)

7. They deliberately rejected all witnesses who assured them that they had knowledge of Drawbaugh's talking machines prior to October, 1876, and, after receiving such assurances again and again, went on in their work of trying to deceive the court as to the fact.

Not only so, but after having learned, through their agents, that David Stevenson, Jr., and the Gregorys would, if called, testify strongly in favor of Drawbaugh's priority of invention, they deliberately charged, in their argument in the court below in the People's Tel. Co. case, that these witnesses would, if called, testify against Drawbaugh, and urged the court to regard the fact of their not having been called and examined as conclusive against Drawbaugh.

8. They refused to allow Orlando Kahney to return and correct his testimony, although he applied to them for the privilege of so doing.

9. They refused to allow James P. Matthews to return and correct his testimony, although he applied to them for the privilege of so doing, and wrote them that, "*My recollection of the whole transaction is so vague that*
"*I never ought to have ventured to say anything about it,*
"*and the portions of my testimany relating to this matter*
"*certainly ought not to be considered by the court when*
"*making up its decision.*" (Add. Proofs, pp. 776–780.)

It is not too much to say that, where a party is shown to have thus been engaged in the work of suppressing evidence, introducing garbled books, and tampering with witnesses, their entire case is to be regarded as strongly suspicious. Who can tell how the testimony which they have introduced has been affected by such efforts, or how much of it is free from the effects of this kind of work? What confidence can we have in any of it?

We have now concluded our examination of the complainants' attempted answer to the Drawbaugh case. We have shown first, that the ingenious theory with which they started out, viz., that Drawbaugh's ideas were derived from Bell, and that the history of his talking machines should commence in the fall of 1876, is disproved by some of the very witnesses, Jacob Evans, Orlando Kahney, Joseph Ditlow, Abraham Ditlow and others, who were called to sustain it; secondly, that their negative evidence is not worthy even of serious consideration, and is, in respect to the majority of their witnesses, specifically rebutted; thirdly, that their attacks upon the dates fixed by a few of the Drawbaugh witnesses resulted in a most ignominious failure; fourthly, that, having failed in all these efforts to meet the defendants' case, they are remitted simply to inference and argument as to the alleged improbabilities of the case; fifthly, that these inferences and arguments, when examined, are found to be utterly inconclusive and worthless, based for the most part upon mere assumption and not upon proof, in other particulars ignoring the evidence, and in still others misrepresenting it; and sixthly, that their methods in working up their case and putting in their evidence were such as to destroy all confidence in anything they have brought before the Court.

A fair and candid review of the evidence on both sides, in accordance with the settled principles of law, shows that the defendants have established their case by proofs so overwhelming as to be probably unprecedented in the history of patent litigation.

With the facts now before us, let us again recur to the law and see whether the defendants have not, in the language of the Supreme Court in *Coffin* v. *Ogden*, brought themselves within its most rigid tests.

Comparing the facts here proved, for example, with the facts proved in *Coffin* v. *Ogden*, we find that in *Coffin* v. *Ogden* the original machines were not produced; here they are offered in evidence; in *Coffin* v. *Ogden* the whole defense rested upon the testimony of four witnesses, swearing to the facts from memory alone, after the lapse of about eight years; here the facts are proved by about two hundred witnesses and by the instruments produced in court; in *Coffin* v. *Ogden* only two or three machines were shown to have ever been made by the inventor, or by his procurement; here a large number of machines are shown to have been made; in *Coffin* v. *Ogden* the inventor's work all took place within about six months, and then ceased forever; here the inventor's work has never ceased from its commencement to the present moment; in *Coffin* v. *Ogden* the inventor was shown not to have patented his invention, nor made any effort to patent it until at least two years after it had been patented to another; here the inventor is shown to have made continuous efforts to get capitalists to interest themselves in the invention, and to have failed only through their lack of judgment. In the language of Bell's attorney to Draper, if they had taken hold of it they would not now need to be manufacturing other things, or troubling themselves about financial matters. In *Coffin* v. *Ogden* there was no clear proof that the invention had ever been used, even experimentally; doubtful evidence seemed to show that it had been for a few days exhibited on a door at Jones, Wallington & Co.'s shop, but not that any use was made of it, either practically or experimentally; here the evidence of scores of witnesses shows that the invention was successfully operated in their presence and by themselves; in *Coffin* v. *Ogden* a mere reproduced machine, made from memory eight years after the original invention, was held to be conclusive evidence that the invention would have operated successfully if it had been put to practical use; here the original anticipating machines are put in evidence, and some of them are admitted even by the complainants' experts to be such as might have been successfully put on the market for business purposes, and are further admitted by complainants' counsel in their Overland brief to be "highly organized" instruments, containing most of the refined improvements of detail found in the best commercial instruments of to-day. In *Coffin* v. *Ogden* there was no patent upon the anticipating invention; no attempt to patent it till years after it was patented to another, and then only an unsuccessful application, probably rejected upon the patent thus granted to another; no manufacture; no attempt to manufacture; no use for practical purposes; no exhibition except for a few days upon one door; no proof of its use for locking even that door; no production of its instruments in court, nor any original models or drawings of them; no publication; no proof of poverty or other reasons for not patenting; no evidence of any kind except the testimony of the inventor and three other witnesses; nothing except oral testimony that one lock was made eight years previous to the suit, and two or three months prior to the invention of the patentee, and that one or two locks were made a few months after the invention of the patentee. Yet, upon this state of facts, both the Circuit court and the Supreme court of the United States held the defense fully made out, and the Supreme court said that, although every reasonable doubt should be resolved in favor of the patent, the defendants had brought themselves within the most rigid requirements of the law in that behalf.

And they reaffirm *Gaylor* v. *Wilder*, where it was held that, although the alleged anticipating invention had never been manufactured for sale, nor patented, nor attempted to be patented, nor advertised, nor mentioned in printed publications, nor shown to the public, nor tested even experimentally for the purposes for which it was designed, nor claimed at the time as an invention, nor produced in court, nor preserved by the inventor; and although the inventor, after keeping his papers in it a while, had thrown it aside and procured another and different safe; yet, if it ever had existed, and the memory of its existence was still within the mind of any living man at the time when the subsequent patent issued to another, this subsequent patent was void—an able minority of the court holding that the subsequent patent was void whether the memory of the anticipating structure remained in the mind of any person when it was granted or whether it did not.

Other authorities light up our course to the proper conclusion in this case. In *The North-Western Fire Extinguishing Co.* v. *The Philadelphia Fire Extinguishing Co.*, 6 O. G. 34, 1 Banning, 177 (McKennan, J., April, 1874), suit was brought upon the *Carlier and Vignon* patent, of April 13, 1869, and defense was made that Dr. Graham, of Virginia, was the original and first inventor. It was shown in defense that Dr. Graham made the invention in 1837, and applied for a patent November 23, 1837, but was rejected through the stupidity of the government officers; and that, in 1843, he made an experimental trial of his apparatus, which resulted in reducing but not extinguishing the fire. The original apparatus remained, and was in evidence. The court said:

> "It was urged, however, that the efforts of Dr. Graham are to be treated as abandoned experiments. An experiment may be a trial either of an incomplete mechanical structure, to ascertaln what changes or additions may be necessary to make it accomplish the design of its projector, or of a completed machine *to illustrate or test its practical efficiency.* Obviously, in the first case, the incompleteness of the inventors efforts, *if they were abandoned,* would have no effect upon the rights of a subsequent inventor.
>
> *But if the experiment proves the capacity of the machine to effect what its inventor proposed, the law assigns to him the merit of having produced a complete invention.*
>
> It is hereinbefore shown that the theory of Dr. Graham attained this practical condition; and there, apparently, his efforts ceased. But why? Repulsed from the Patent Office by the arbitrary assumption that his enterprise was impracticable with the employment of any mechanical auxiliaries whatever, without pecuniary resources, his 'poverty, not his will, consented' to an abandonment of further effort to secure the full benefit of his invention to himself and to the public. *But this will not help the complainants.* The most that can be predicated of his inaction is that he abandoned the invention to the public, although I do not affirm this hypothesis. But if he did, it will not reduce his matured invention to the grade of a mere experiment, and open the way for the complainants to appropriate the title of first inventor."

Language could hardly be stronger than this; and it is also a significant fact that, although the invention had been in the most public and notorious use throughout the world in the form of the "Babcock Fire Extinguisher" and other similar machines for many years, yet Congress, four years after this decision, granted to Dr. Graham's heirs a broad patent for his original invention, thereby evincing their opinion also as to his priority of invention over all others being exclusively established by the facts cited.

In no one of the above cases were the facts established with half the probative force of the evidence which proves Drawbaugh's prior invention and perfection of the electric speaking telephone.

A BRIEF REVIEW OF JUDGE WALLACE'S TWO OPINIONS IN THE COURT BELOW.

Judge WALLACE decided the case of *The American Bell Telephone Co. et al.* v. *The People's Telephone Co. et als.*, on December 1, 1884. Subsequently, in the *Overland* case, further testimony was taken as to Drawbaugh's prior invention, and, by stipulation, this was introduced as additional evidence in the case of *The People's Telephone Co.*, and a rehearing was asked thereon. This application was heard, and, upon such further evidence, Judge Wallace again found for the complainants, in an opinion filed by him December 4, 1885. His first opinion is printed in D. Add. Proofs, immediately following p. 764; his second opinion occupies pp. 765, 766.

It may be fairly assumed that these two opinions, written by a judge presumably fair and intelligent, present the strongest argument that can be made against the Drawbaugh claim of priority of invention. The other arguments to which we have replied in the earlier parts of this brief, are the arguments of counsel deeply interested in maintaining their theory of the case and strongly affected with partisan bias; this, on the contrary, is presumably the argument of a disinterested judge endeavoring to give a fair reason for his opinion adverse to the defendants below.

But the argument of a court, like the arguments of counsel, must stand or fall upon its inherent fairness, logic and agreement with the evidence.

Tested by this rule, it is not too much to say that the opinions of Judge Wallace in this case are, to a most extraordinary degree, oblivious of proved facts, illogical and inconsistent; and that, if this was the best that could be said in answer to the Drawbaugh case, it was equivalent to admitting that no fair and logical answer can be made to it.

First. Its mis-statements of proved facts are simply astounding.

Take, for example, his assumption that the biography of Daniel Drawbaugh which appeared in Wing's History of Cumberland County, in the spring of 1879, was composed by Daniel Drawbaugh himself. Judge Wallace not only assumes this to be the fact, but, basing his reasoning thereon, he proceeds to find Drawbaugh to be a vain, egotistical, silly person, who ought not to be believed on oath, and whose "autobiography" "suggests the charlatan." The assumption as to the authorship of this document seems to be the key-note to the whole theory of the learned judge's decision.

When Judge Wallace wrote the scathing denunciation of Drawbaugh for his assumed authorship of the biography, there lay in the judge's desk, among the exhibits in the case, *the original manuscript of this biography, proved by the appellee's witness, Nesbit, and admitted by the appellee's counsel, in argument, to be in the handwriting of Mr. Hull, the publisher's agent, for collecting historcial information for his book, and admitted to be the original manuscript of the biography!* (See Mr. Storrow's printed argument in the court below, bottom of page 116 and top of page 117.) Mr. Hull died in the spring of 1879, about the time when the book appeared, and this manuscript was found among his papers after his death. (And see *ante*, p——).

Of course, this fact disposes of Judge Wallace's whole arraignment of Drawbaugh, which is based upon the gross mistake as to the authorship of the article in question.

Such a mistake ought never to have been made. The internal evidence of the article itself should have guarded the court against it. *It was written by a person who did not even know Drawbaugh's age, and leaves the year of his birth a blank!* Its fulsome compliments show at a glance that it is the work of a penny-a-liner. It had been proved by the witnesses in the case, *on both sides*, that Drawbaugh was a singularly modest, diffident, honest and truthful man; and this evidence should not have been overlooked, but his character, proved as an element of the case, should have been taken into consideration. (See *ante*, pp.——).

Through all his adversity; when he was utterly unable to meet his debts or obligations; when he had to borrow money to support his family, and was unable to repay it for years; when his creditors were dogging him from day to day and hour to hour, unable to get anything but promises to pay when he should be able; when the tax collector, from motives of humanity, was paying his taxes out of his own pocket and waiting years for their return; when judgments and executions were issuing against him; such was the known honesty and truthfulness of his character that even his creditors never lost confidence in his integrity nor in his word. What other man could have successfully stood such a test as this? What higher proof of character could be offered?

We submit that this proved character should have been made a controlling element of the judge's decision, and that it was gross error to disregard it.

Take, as another example, Judge Wallace's statements as to Drawbaugh's property, which are entirely wrong in very important particnlars. As an illustration of this fact, Judge Wallace states that "From 1867 to April, "1872, he was the owner of real estate, for which he "had paid $2,300 in the fall of 1867, and upon which he "expended in improvements, in the spring of 1868, from "$300 to $400, and which was encumbered only by a "prior lien for $300. In the spring of 1872 he encumbered it for $1,000, not as a principal, but as a "surety." Nothing could be more misleading than this statement.

The following statement, collated from the records of the Court of Common Pleas of Cumberland county, Pensylvania (see Defendant's People's Co. Record, Book of Exhibits, pp. 26-74), shows the state of liens upon Drawbaugh's Milltown property, from the date of its purchase, in the spring of 1868, to the date of its sale, in April, 1876:

April, 1868, to May 3, 1869, $310.00, interest and costs.

May 3, 1869, to March 26, 1870, $1,810.00, interest and costs.

March 26, 1870, to May 17, 1871, $910.00, interest and costs.

May 17, 1871, to November 17, 1871, $970.00, interest and costs.

November 17, 1871, to January 11, 1872, $910.00, interest and costs.

January 11, 1872, to February 10, 1873, $1,910.00, interest and costs.

February 10, 1873, to March 17, 1873, $2,022.67, interest and costs.

March 17, 1873, to July, 1873, $2,115.49, interest and costs.

July to December 13, 1875, $1,805.49, interest and costs.

December 13, 1875, to April , 1876, when house was sold to Fettrow, $1,833.30, interest and costs.

There was also a judgment note outstanding against him from and after April 1, 1869, for $1,000.

To assume that he could have raised any money upon a property so encumbered is simply absurd; while to assume that he should have tried to sell the property before his judgment-note creditors could record their lien, is simply to assume that he should have shown himself a thorough scoundrel, which was totally foreign to his nature.

Again, Judge Wallace's bare schedule of his receipts during the years 1869, 1870, 1871, 1872, 1873, 1874, 1875 and 1876, without considering the load of debt under which he was struggling all the while, is manifestly unfair and unjust. Without debts, the amount of his receipts was hardly adequate to the support of his large family, with the sickness and death that intervened in those years. But with creditors pressing upon him for old debts, watching closely for any expected accession to his funds, dogging him for their dues and threatening to take his home from him, the amount of his slender receipts was hardly sufficient to keep the wolf from his door; and his testimony that the financial pressure upon him continued to grow greater and greater all the while, is, beyond all question, the melancholy truth. No review of his meager assets which does not also take into consideration his debts and the constant pressure upon him for money is either adequate or just.

Mrs. Drawbaugh's testimony in the Overland case (Add. Proofs, pp. 221–233) conclusively confirms all his statements about his constant poverty during those years, and also shows that in addition to and explanation of his adversities, he lacked every quality of a skillful business man, and that his total absorption in his great invention contributed materially to his unfortunate financial condition. These facts should all have weighed heavily in any just judgment upon the case, but they appear to have been utterly overlooked by Judge Wallace.

The entire theory of Judge Wallace seems to have been founded upon—first, upon his erroneous assumption that Drawbaugh composed the biography found in Wing's history; secondly, upon his erroneous assumption that Drawbaugh overstated his poverty during the years 1869–1880; and thirdly, upon his entire disregard of the overwhelming evidence as to Drawbaugh's character for honesty, truthfulness, modesty and sincerity. He confessedly could not find for the complainants below without attacking and disposing of Drawbaugh as a witness, and he could do this only by utterly unfounded and erroneous assumptions, in conflict with the fullest and clearest evidence in the case.

Second. Judge Wallace then goes out of his way to attack even the appellants and their counsel. He says, in substance, that they concocted this plea of poverty, formulated it in the answer, elaborately fortified it by witnesses and caused it to be testified to by Drawbaugh.

A more unfounded and unjust assertion never was judicially made, and it is flatly contradicted and disproved by one of the appellees' witnesses, *James P. Matthews*, upon whose testimony Judge Wallace expressly relies in another part of his opinion, although Mr. Matthews had written a letter, which was before the court, stating that no reliance whatever was to be placed upon his recollection of the facts thus cited by the court. Mr. Matthews was at Drawbaugh's shop in April, 1878, to examine his electric clocks, and wrote out and published an account of the visit in November, 1878, in the course of which he stated, from information casually derived from Drawbaugh during his visit, that nothing but Drawbaugh's *poverty* prevented him from anticipating both Bell and Edison in the invention of the telephone! (C. Vol. 1, p. 543.) This article, published in November, 1878, from information obtained in April, 1878, *two years before the appellants ever heard of Daniel Drawbaugh*, shows that the "theory of constraining poverty" was *not* originated by appellants or their counsel, but was the explanation given by Drawbaugh himself to the witness for the Bell Telephone Company years prior to the institution of this suit. Comment is unnecessary.

Third. The inconsistent and illogical character of the reasoning of the court below next demands attention. Facts of the utmost importance are admitted, in one part of the opinion, to have been conclusively proved, only to be utterly disregarded at all other parts of the opinion. Thus the court says:

"The proofs leave no room for fair doubt that defendants' contention is substantially true, or that the defense has no foundation in fact. It is either true that Drawbaugh had long been treading his solitary path of investigation and experiment in poverty and obscurity, but had perfected his work when the inventions of other explorers were in embryo, or his story is an ingenious fabrication." * * *

"Thus Drawbaugh is corroborated by a cloud of witnesses whose testimony tends to substantiate his narrative. Without stopping at this point to consider the credibility and probative force of their testimony, it suffices to state that, although some of the witnesses seem to have been reckless and unscrupulous in their statements, *the great body of them are undoubtedly honest witnesses*." * * *

"*The case made by these witnesses is sufficiently formidable to overcome the legal presumption of the validity of the complainants' patents.* * * * Of necessity the testimony of most of the defendants' witnesses can only be attacked *by showing that the witnesses are mistaken as to the time* when they saw Drawbaugh's talking machine, *or as to what they really saw on the occasions they refer to.*"

And then, does the court proceed to show that this great body of honest witnesses, whose testimony is admittedly sufficient to overthrow the Bell patents, *were* mistaken as to the time when they saw Drawbaugh's talking machines, or as to what they really saw? *Not at all*—but, only stopping to pick a flaw in the testimony of Nichols, one witness out of over two hundred, the court proceeds to beg the whole question, by stating that—

"In cases where such a chaos of testimony exists, it is usually found that the judgment is convinced by a few leading facts and *indicia*, outlined so clearly that they cannot be obscured by prevarication" (of honest witnesses?) "or aberrations of memory. Such facts and *indicia* are found here, and they are so persuasive and cogent that the *testimony of a myriad of witnesses cannot prevail against them.*"

Here the facts are admitted that the great body of

Drawbaugh's witnesses are truthful and honest; that their evidence is amply sufficient to overcome the validity of the Bell patents; and that it can be met *only by showing that they were mistaken in their dates, or as to what they saw;* but it is asserted that a judge, in his discretion, may absolutely disregard the testimony of a *myriad* of such witnesses, if, for any reason, he thinks their story improbable or discovers any outside unexplainable fact which he regards as inconsistent with it!

Fourth. Then the court sets forth, in order, the fact which it deems conclusive to overthrow the positive testimony of even a *myriad* of honest witnesses, *in a telephone case.*

The *first* is that Drawbaugh wrote a biography of himself *which,* as we have shown, *he did not write.*

The *second* is that he was a "skillful and ingenious mechanic," who had taken out numerous prior patents for "improvements" in various machines, but never on a great invention like the telephone! In this connection, the court reviews, in a manifestly unfair and prejudiced spirit, some of Drawbaugh's other inventions, to show that some of them were unimportant and others mere discoveries of old things. On this rule, it is as easy to prove that Bell could not have invented the telephone as that Drawbaugh could not. Bell's multiple telegraph is a known failure. He re-invented Page's old discovery of a musical sound in an empty helix when a broken circuit of electricity is sent through it, and thought it a great and wonderful discovery of his own. He re-invented the old *autograph telegraph* of Bonelli, and believed himself the author of it for awhile. Every prolific inventor re-invents old machines and devices, as well as invents many new devices not particularly useful. The most of Drawbaugh's inventions were new, and many of them were useful and valuable to their owners, although he never derived much profit from them. The appellees' witness, Weaver, resorted to him in 1867 to invent a tack machine, because he was a man who could invent *anything*; and he was not disappointed, for Drawbaugh immediately produced the tack machine that others had striven unsuccessfully to devise!

The *third indicium* which impressed the court below as unanswerable was, that the telephone was a difficult thing to invent, and therefore it must be conclusively presumed that Drawbaugh could not invent it!

Again, that Drawbaugh could not, in 1882, set forth in order the long series of experiments, reasonings and investigations which he made between 1859 (see testimony of Prof. Heiges) and 1866, through which he arrived at the conception of the unbroken, variable or "undulatory" current, and at the first machines in which he embodied this conception.

It would, indeed, be surprising if he *could* remember such steps. The idea must have dawned upon him little by little, as he explored multitudes of different paths, some of which, in the nature of things, must have tended to lead him away from the true direction, and some towards it. The true conception of the right way to attain the desired result would necessarily be a thing of slow and almost imperceptible growth and development, even to the inventor himself. Even the first instrument which he produced—the old teacup transmitter of 1866—he says, did not solve the question, but only gave such results as to indicate that he was at last on the right path. He used different forms of receiver with it, but cannot remember their exact details of construction, until he comes to the first form of Exhibit B. But when the first operative instruments, F and B, were produced, about 1867 and 1868, there is no longer any uncertainty about his memory. The steps were now not merely mental and experimental, but visible and tangible, and the results were such as to impress his memory for all time.

Suppose we pause to compare, for a moment, Drawbaugh's simple and evidently truthful statement of his present inability to recall in detail the steps which led his mind up to his great discovery, with the astounding fact that Bell heard his first *speech* or *sound* through Gray's transmitter, on March 10, 1876, and had a written memorandum made of the fact and date, and yet, in his London lecture, delivered in the fall of 1877, and in his testimony in the Dowd case, given in 1879, *totally forgot to mention the great fact*, and actually attributed his first hearing of speech through a telephone to his *own* telephones of April, 1876, which had the armature made like a thumbnail and shellacked upon the center of the diaphragm! Shall we reject, as incredible, Drawbaugh's inability to remember his early mental steps and reasonings in the years from 1859 to 1866, and at the same time swallow, as perfectly credible, the astonishing story that Bell in a year and a half, forgot all about having gotten his first speech through Gray's transmitter on March 10, 1876!

The *fourth* fact that seemed to Judge Wallace to outweigh the testimony of two hundred witnesses, was that Drawbaugh did not bring his telephone to the knowledge of Keifer, Wilson, Houck, Stees, Lloyd, and the members of the old Faucet or Pump company.

As to *Keifer* and *Wilson*, Drawbaugh had very little acquaintance with either of them. *They were never at his shop prior to this suit.* He seems to have called upon them at Harrisburg *only to beg old scraps of wire and other refuse materials that he might be able to use in his experiments*—a fact which speaks volumes as to his poverty at the time. If he mentioned his talking-machine they probably took little notice of it, and the fact soon passed out of their memory. If they received his statements with indifference or derision, he was so sensitive a man that he would never have referred to it again in their presence.

As to *Lloyd*, he has undoubtedly grossly exaggerated his alleged intimacy with Drawbaugh. He never was in Drawbaugh's house; nor was Drawbaugh ever in his, except to call twice at his office on business. (C. Vol. 2, p. 1274, Ans. 86; p. 1275, Ans. 92.) He never was even at Drawbaugh's shop but five times, to wit: once about 1866 or 1867, on business (see his answers, 4–7); once again, about the same time, on business (Ans. 8–12; Ans. 80); once again, about 1871 or 1872, to see the nail machine (Ans. 80);* once again, in 1875 or 1876, on business, to get a glass lens ground (Ans. 35–41; Ans. 27, 75), and once with Worley, in 1878, to see the electric clock. (Ans. 52, 96.) At the latter visit, Drawbaugh showed them a *new* telephone that he was inventing, and incidentally mentioned some difficulty in it which he was trying to overcome; but his statements were such as might be made about any new telephone he is inventing *to-day* and prove nothing as to his prior completed instruments. He did not mention his earlier instruments, nor mention this as his first (Ans. 113, 106, 102–113). One of Drawbaugh's calls at Lloyd's house was to borrow ten dollars (Ans. 44), which is about the only evidence of intimacy disclosed in the witness' deposition. The whole deposition is entirely negative in character, and would not affect the testimony of even a single positive witness. Neither Keifer nor Wilson swear positively that Drawbaugh never mentioned his telephones to them when he called at their offices to get old scraps, but simply that they do not *remember* that he did.

---

*Note.—The nail machine was always kept in the cellar, and would not lead any visitor to that part of the shop where the telephones were.

As to *Houck, he is a convicted perjurer* (C. Vol. 1, pp. 823–826), who attempted to steal Drawbaugh's new faucet invention and bolster up the theft by perjury, in 1879, but was defeated in the effort.

As to *Stees*, Judge Wallace says:

> "Mr. Stees was the superintendent of a car company at Harrisburg, having shops in different parts of the city, connected by telegraph lines. He was the first person to employ Bell's telephone on these lines, when they were introduced into Harrisburg, late in 1877 or early in 1878. He was a friend of Drawbaugh, and Drawbaugh would naturally have applied to him if he wanted to test his telephone publicly and practically."

And that is exactly what Drawbaugh did, as we learn from the testimony of young Stees (*Additional Proofs*, pp. 209–220), Johnson (Id., pp. 198–209), and Drawbaugh (D. Vol. 2, pp. 1047, 1049, Ans. 1376, 1393).

As to the old *Faucet Company*, we have produced the evidence of their employes, Joseph and Emanuel K. Gregory (Additional Proofs, pp. 181–196); Schrader (D. Sur-rebuttal, pp. 467–471); Hoffman (D. Vol. 1, pp. 481–484); all of whom testify positively to their knowledge of Drawbaugh's telephones at that time, and two of whom (E. K. Gregory and Schrader) testify to the very details of the experiments and instruments, and identify the latter. We have also the affidavit of Dr. Mosser, the secretary and treasurer of the company (who died before his testimony could be taken in these cases) which will be found in C. Vol. 2, p. 1146, which is corroborated in part by the deposition of Prof. Heiges (D. Sur-rebuttal, pp. 95–103). We have also the deposition of William R. Gorgas, the president of the faucet company, an old man, who states that at one time Drawbaugh desired him to take a half interest in some invention and furnish the money for patenting it, but as he, Gorgas, was losing $4,000 in the faucet business, and "had a surfeit" of patents, he paid no attention to the matter (D. Surrebuttal, pp. 1128, 1129). Thus, the evidence of the faucet company, and their employes, *does* corroborate Drawbaugh, and in the most positive and conclusive manner, Judge Wallace's comments notwithstanding. The learned judge seems to have read only the complainants' brief, and to have neglected the *evidence*.

But why should the court pick out *certain individuals* and say that the unexplained fact of Drawbaugh's not having presented his telephone for *their* consideration negatives the positive testimony of hundreds of witnesses that he had it, and the testimony of numerous capitalists that he tried to interest them in it and get them to furnish the money for patenting and introducing it into use? What rule of evidence authorizes so extraordinary a conclusion?

Fifth. The court refers to three instances of what it terms Drawbaugh's "*declarations*," which it considers of such importance as to outweigh the testimony of a "myriad of witnesses," viz: his business card, printed in 1875; his testimony in the Houck interference, given in June, 1879, and his alleged statements to James P. Matthews, in April, 1878. But, when these "declarations" are examined, they will be found to be, not "declarations," but only the *absence* of declarations.

The *business card* merely gives a list of *some* of his inventions, omitting, as we have already shown (*ante*, pp. 253-257), *at least eight besides the telephone*, all of which he is known and admitted to have made before 1875. It is not what the card *states* but what it *omits to state* which impressed the court below; yet its omission to state the other eight inventions does not in any way disprove their admitted existence, and it certainly can have no greater probative force as to the omitted *ninth* invention.

The *interference testimony* incidentally alluded to the telephone and phonograph, and only incidentally. Mr. Drawbaugh was not questioned about the talking machine, but, in referring to a faucet sketch which was put in evidence his memory apparently associated it in some way with some particular telephone or phonograph experiment made between 1874 and 1876, which mental association enabled him to fix the date of the faucet sketch. Nothing more than this can fairly be inferred from his merely incidental allusion to the telephone.

The *Matthews interview* was on the subject of electric clocks. Matthews understood little or nothing of electricity, and grossly misunderstood and misdescribed even the electric clock itself to which his attention was mainly given. (See Drawbaugh, D. Vol. 2, pp. 1030 to 1040, Ans. 1516 to 1524.) The telephone was mentioned only incidentally and casually, and, beyond all question, Drawbaugh's remarks about it were also either misunderstood or misrecollected. Matthews himself, after he had left the witness stand, pricked in his conscience at the conviction that he had gone too far in attempting to state what occurred in reference to the telephone, wrote the counsel for the Bell Telephone Company, asking them to suppress the deposition, and saying that his memory of the matter was so vague and uncertain that no court ought to receive it as evidence; yet the court below makes this deposition one of the chief corner-stones in the structure of its argument against Drawbaugh's claim of priority!

Sixth. The court cites, as one of the conclusive "*indicia*," that the newspapers made no mention of Drawbaugh's telephone till 1878, although they had mentioned Bell's telephone. Is *that* a fact sufficient to outweigh the positive testimony of even *one* witness?

Seventh. Another of the "*indicia*" is, that Drawbaugh borrowed, for a few days, a telephone, of the "Phelps Snuff-box" form, as the judge states, "late in 1877 or early in 1878," and that this instrument resembled Exhibit A in external appearance.

First, the judge misstates the fact as to the time—it was late in the spring or early in the summer of 1878 (see Zeigler's test'y, C. Vol. 2, p. 1027, Ans. 17; p. 1035, Ans. 83.)

Second, the instrument "A" which Zeigler says is the one Drawbaugh brought to him at the time when he borrowed the Phelps snuff-box telephone, is proved *by complainants below* to have been in existence *months* before that time (Testy. of Geo. C. Rupp, C. Vol. 2, pp. 1122, 1128, Ans. 22, 27; A. L. Rupp, in whose family Geo. C. Rupp lived, C. Vol. 2, p. 1114, Ans. 24). Drawbaugh did not, therefore, derive "A," from the "Phelps Snuff-box."

Third, in view of the above facts, the only fair inference derivable from Drawbaugh's remark, as reported by Zeigler, is that he found his instrument "A," which he had made years before, now patented to another, and having no financial means to contest with so powerful an adversary, he feared that it was lost to him.

Eighth. Another of the "*indicia*" referred to by the court below, is the *negative* testimony as put in by the appellee. This subject is exhaustively discussed in Appendix C which follows this brief, where the appellee's negative testimony is shown to be completely nugatory, and to have broken down at all points. The court below was evidently impressed with the worthlessness of such evidence in general, but, referring to it in this case, states that: "What gives point and force to this testimony and parries the ordinary objections to the reliability of verbal declarations, is that these witnesses are persons who *would have been forcibly impressed*, because of *their interest in the particular subject*, by any assertion by Drawbaugh that he was the inventor of the telephone"!

It is a sufficient answer to this statement to say that it is a gross error—no *such person* is to be found among the appellee's negative witnesses!

Ninth. Another of the so-called "*indicia*" is found in the testimony of witnesses "such as Mr. Weaver and Mr. Grissinger, showing declarations of Drawbaugh made after the Bell telephone was in commercial use, to the effect that, although he experimented on the telephone years before Bell, he had obtained no satisfactory results."

Weaver and Grissinger are both shown by their cross-examination to have been personally hostile to Drawbaugh; and Weaver is shown to have been a disreputable shyster.

Their cross-examination, especially that of Weaver, shows clearly that Drawbaugh, in his alleged interview on the subject of the telephone, had his attention directed to his *first* telephone experiments—the old tea-cup transmitter—and was speaking only of the performances of his earliest instruments. These instruments Drawbaugh *testified* were not satisfactory; and it would be just as much in point to quote against him what he *testified*, as what he said to Weaver and Grissinger on the same subject. The court's error here consists in taking what he said about his *first* instruments as relating to all his instruments prior to 1876—an error which shows the danger of relying upon vague recollections of past conversations in answer to positive uncontradicted testimony.

Tenth. The court, after stating these various "*indicia*," makes the broad assertion that "the testimony of *many other* witnesses is overthrown by the *palpable improbability of their statements*, or by the *contradictions between their statements and those of other witnesses for the defendant*, or by *successful attacks upon their accuracy in the rebutting testimony of the complainant*."

It is well that the court did not cite the names of the "many other witnesses" here referred to, for it could easily have been shown that it was in the grossest error in the whole statement! With the exception of an error or two in *dates*, assigned by, at most, *two or three* witnesses, the statement is wholly unfounded; and these errors in dates are utterly immaterial because corrected by other of the defendants' witnesses.

This concludes our review of the court's "*indicia*." Each one of the "indicia" is clearly shown to be thoroughly worthless, when considered by itself, by an unprejudiced mind. A chain is no stronger than its links, no matter how long it may be. A dozen "indicia," each separately inconclusive, do not prove more than would be proved by one alone. To set up such worthless stuff as sufficient to answer the clear, positive, uncontradicted testimony of hundreds of disinterested witnesses, all testifying from personal experience and knowledge, is a perversion of the laws of evidence and the functions of a court of justice.

Still reviewing the opinion of the court below, we come, next, to a remarkable admission, to wit: that, notwithstanding all that can be said against Drawbaugh's claim to priority, "*no doubt is entertained that Drawbaugh was experimenting at an early date with telephones or phonographs;*" and the court then goes on to admit that these experiments began prior to 1869, and continued till after 1876.

In the earlier pages of the opinion, the court had said that:

> "It is either true that Drawbaugh had long been treading his solitary path of investigation and experiment in poverty and obscurity, but had perfected his work when the inventions of other explorers were in embryo, or his story is an ingenious fabrication."

But, if it be true, as conceded in the later part of the opinion, that Drawbaugh had been experimenting on telephones from a period prior to 1869 to a period subsequent to 1876, then his story is clearly *not* "an ingenious fabrication," but is founded upon admitted fact about which "no doubt is entertained," and the court should have accepted what it had itself stated as the only alternative, to wit: that he "had long been treading his solitary path of investigation and experiment in poverty and obscurity, but had perfected his work when the inventions of other explorers were in embryo." The court however refuses to accept its own alternative, and tries to explain away the admitted fact about which "no doubt is entertained."

This attempted explanation is so remarkable a piece of judicial reasoning that we shall give it the prominence which it deserves.

Briefly, it is this:

That, prior to May, 1869, Drawbaugh was probably experimenting on the Scott phonograph or phonautograph.

That, in May, 1869, a description of the Reis telephone was published in a New York newspaper, entitled "*The Manufacturer and Builder.*" "Whether other newspapers" copied the article or not, the court admits, "is not shown, nor is it shown that Drawbaugh saw the article in *The Manufacturer and Builder*. *It would be difficult to prove the circumstance if he did see it.*" Hence the court simply *assumes* that he saw it or "*some such publication,*" in the absence of all evidence to that effect, and in the teeth of Drawbaugh's testimony that he never knew of the Reis telephone till the fall of 1876.

Having these extraordinary assumptions in mind, let us now turn to an earlier page of the opinion, where the court, referring to all the Drawbaugh telephone instruments, says:

> "*That the talking machines referred to by the witnesses were* ELECTRIC *instruments is clearly established.* Drawbaugh testifies explicitly that they were always used with a closed circuit, and without breaking the current, some of them being battery telephones, and some magneto telephones. He always represented them as actuated by electricity to those to whom he explained or described them, and claimed his invention would supersede the telegraph. *His assertions show them to have been electrical instruments.*"

Citing, then, a list of witnesses two pages long, in support of the statement.

Now, then, these "talking machines" were *electrical* machines; but the Scott phonograph, or phonautograph, was *not* an electrical instrument—there was no electricity about it. The "probable" experiments with the Scott phonautograph, from 1863 to May, 1869 (which experiments there is not an iota of evidence to show were ever made, but all is mere assumption), do not, therefore, even if true, account for his *electrical* talking machine experiments during those years. *The attempted explanation thus breaks down at the very outset!*

But how was Judge Wallace led into the palpable error of attempting to account for experiments with an admittedly electrical talking machine, by supposing them to have been experiments on a *phonautograph?* We answer, that it was because, when he prepared and filed his opinion, he ignorantly supposed a phonautograph *to be an electrical machine!* Proof of this is contained in the opinion itself, as first filed on Dec. 1, 1884. A copy of the opinion, *as then filed*, is to be found in the *Additional Proofs*, pp. 394-427 (and see top of page 245). By reference to this original opinion (*Id.*, p. 423), it will be seen that it speaks of the phonograph, or phonautograph, as an electrical machine—"the electric mechanism of the phonograph." A few days afterwards, the original opinion disappeared from the files of the court, and a printed copy (printed in Boston) took its place; and in this latter opinion, the word "electric" is omitted before "mechanism of the phonograph."

The original opinion, with reference in it to a phonograph as an electric machine, would have been a laughing-stock to the scientific world, but would have suggested, at least, a *logical* explanation of Drawbaugh's electric talking machine experiments prior to May, 1869. The amended opinion is no longer a laughing-stock to the scientist, *but its logic is spoiled!* It now undertakes to account for Drawbaugh's electrical experiments by a hypothesis which "fails to connect." The court blundered into a ridiculous scientific error in trying to account for Drawbaugh's early electrical talking machine experiments, and then, discovering the awkward situation, blundered into an equally ridiculous *non sequitur*, in trying to get out of it!

Note once again the inconsistency and absurdity of the court's attempted explanation of Drawbaugh's talking machine experiments.

First, from 1863 to May, 1869, he is assumed, without a particle of evidence, to have been tinkering with a phonograph, which does not at all account for the proved electrical character of the experiments.

Then presto, change! He is assumed, *without a particle of evidence*, to have suddenly ceased his phonograph experiments and gone to tinkering with a Reis telephone, which the evidence shows he was totally ignorant of till the fall of 1876. But his telephones are shown to have *talked*, and the Reis telephone is assumed to be incapable of talking.

Presto, change, again! From the fall of 1876 to 1880, he is assumed to have been tinkering at the Bell telephone.

Yet, the entire uncontradicted evidence shows that the line of his talking machine work was a straight, unbroken line, beginning prior to 1866 and running right along without change in its general character. The machines which were seen at his shop prior to 1869, continued to be seen there till they were put in evidence in this case. They are proved to have been used for transmitting speech to a distance by electricity prior to 1869, and ever since. New machines from time to time appeared, but the old ones still remained, and the new ones were merely their outgrowths—their maturer developments.

Which is the more rational and consistent explanation of the admitted facts—that assumed by Judge Wallace, *in direct opposition to the evidence*, and which requires three abrupt changes of position, of which no hint is given in the testimony; or that given by Drawbaugh and corroborated by hundreds of admittedly honest witnesses? Nay, is not Judge Wallace's suggested explanation more incredible than anything to be found in the Drawbaugh case?

In the latter part of March, 1882, in the People's Telephone case, a test of the Drawbaugh instruments was made at New York, the instruments being the original D, E, A, H, &c., and reproductions of F, B, C and I. In this test all the original instruments proved themselves to be good, practical speaking telephones; but the reproduced instruments, while they transmitted words and sentences, did not operate so satisfactorily as the others.

These reproduced instruments, thus tested, were the identical reproductions that had been put in evidence nearly two years before. They had been shipped back and forth to New York, Philadelphia, Baltimore, Harrisburg, dozens of times; and had been taken apart and put together again by draughtsmen, witnesses, experts and counsel scores of times. They were shattered, dilapidated, loose, and in no condition to operate, whatever may have been their original condition. Yet they all talked, though as might have been expected, not perfectly. Judge Wallace, disregarding their shattered condition, held that, although they all talked, yet they did not talk so well as the witnesses had all testified that the original instruments talked at Drawbaugh's shop, and therefore he came to the extraordinary conclusion that all the witnesses had testified falsely!

In the Overland case, on February 6, 1885, (See D. Add. Proofs, pp. 247-310, 542-624; and see Prof. Barker's deposition, Id. pp. 6-35), a further test of reproduced instruments F, B, C and I, was made at Philadelphia. This time the reproductions were new, and in suitable condition for a practical test. The test was perfectly conclusive. All of the instruments transmitted and reproduced speech without difficulty, and in every respect their performances corresponded to what the witnesses had stated of the originals at Drawbaugh's shop.

Yet the court below, having ruled that the dilapidated instruments tested in 1882, gave the lie to the witnesses, refused, on rehearing, to pay any attention to the testimony of the new and undilapidated reproductions of February, 1885.

In assigning a reason for this strange ruling, the court grossly misstated the facts and the evidence. (See second opinion of Judge Wallace, Additional Proofs, pp. 765, 766.) First, it totally disregarded the performances of the new reproductions of B, C, and I, and threw the whole case upon the fourth instrument, F, although that was of no greater importance than any of the others. Secondly, it alleged that this instrument F contained a "new conducting material" not used in the former reproductions or instruments, and adapted to be adjusted in a new and different way—every word of which was gross error! The "conducting material" was powdered carbon alone, and carbon and bronze (See Id. p. 624; and Prof. Barker, Ans. 80, pp. 27, 28), which is exactly the material described by Drawbaugh in his evidence in the winter of 1881–2 (D. Vol. 2, Ans. 131, 1290, pp. 801, 999;). Prof. Barker testifies (Ans. 79, pp. 26, 27) that the instruments were exact and faithful reproductions of the original instruments and drawings. And, in answer to the judge's suggestion as to the adjustment of instrument F (by which he means that it was held in an inclined position, as described in the Hunnings patent), we have only to cite the testimony of Prof. Barker, who had these instruments at the University of Pennsylvania testing them privately for his own information, for several weeks before the public test in question, and who swears that the instrument F worked best when *not* held in the hand but "*allowed to remain fixed in one position.*" (Ans. 84, p. 28.) As a result of all his tests he states that "When once in adjustment, *if allowed to remain fixed in one position, they retain their adjustment very well;* but when disturbed, *as when the tumbler is taken in the hand and held to the mouth*, the loose carbon in the box may change its position and impair the articulation."

That the differences in the fineness of the carbon were immaterial, appears from Prof. Barker's answer, 80, 81, pp. 27, 28. The carbon of F^3 was much finer than that of F^1 and F^2, and was mixed with the bronze powder (Ans. 80), and F^3 gave a trifle the better articulation (Ans. 81). *This is in direct confirmation of Mr. Drawbaugh as he testified in 1881–2.* (D. Vol. 2, p. 999, Ans. 1293.)

Prof. Barker further states (Ans. 81) that the tumbler instrument F² seemed to be the easier to adjust and to stay in adjustment better. This was the "one-legged instrument" (Ans. 63), concerning which Mr. Storrow had told the court below, in his argument in September and October, 1884, that such an instrument could not *possibly* operate, and that the defendants had not *dared* to make a test with it in the spring of 1882!

There is no doubt whatever that Judge Wallace was misled into the grossest errors, and even into a deep-seated, however unconscious, prejudice against the Drawbaugh case, by just such unfounded statements of counsel as this.

But why should the court have ignored the performances of the reproduced instruments B, C and I? These instruments were not carbon instruments; *they* had no different conducting material, for they had none at all, but were magneto-telephones; it made no difference how *they* were held—whether at an angle, in the hands, or resting on the table. They demonstrate conclusively that Bell's invention was completely anticipated by Drawbaugh as early as 1870, at least.

Still further reviewing Judge Wallace's first opinion, we will now proceed to point out certain errors of statement found therein, which show the singularly careless manner in which the court examined the evidence, and the ready ear which it lent to every suggestion of complainant's counsel. They may be regarded as trifles, in view of the greater importance of the matters already hereinabove considered: but trifles "show which way the wind blows."

1. William Darr, one of the negative witnesses of ap-

pellees, was examined to show that although he lived near Drawbaugh up to about 1869, he never heard of the talking machine. On cross-examination he broke down and admitted that, at that early time, Drawbaugh spoke to him of talking across the Atlantic ocean, to which the witness replied that he had better try his machine across the Yellow Breeches creek first. The appellants, in reply, called his wife (D. Sur-rebuttal, pp. 109–113), his daughter Maggie (Id. pp. 103–109), his daughter Jennie (Id. pp. 163–170) and his son-in-law, John Brenneman (Id. pp. 114–116), to prove that the Drawbaugh talking machine was perfectly well known in the Darr family, and in the community, at that early date.

The court below speaks of this witness, William Darr, as a "hard-headed old farmer." *He never was a farmer, nor ever pretended to be;* and as for his "hard head," his own family unanimously testified that he was a miserable, drunken sot, wrecked years ago, physically and mentally, by his drinking habit, and from whom the whole family had been obliged to separate and leave him to his ruin. Yet this drunken cabinet-maker is galvanized in the court's opinion into a "*hard-headed old farmer.*"

2. The court below says of Henry Bayler, that he "testifies that he talked through F and B in 1873, but the proofs show that the occasion was between 1875 and 1877."

The proofs show no such thing. They show, on the contrary, that the conversation was just when Mr. Baylor said it was, viz., May or June, 1873. The court's suggestion as to a later date is not based upon the evidence, but upon a false statement in complainants' "Abstract" as to the arrangement of the rooms in the shop in 1873, and as to what Mr. Baylor testified about the running of the talking machine wires.

3. The court below says of H. B. Musser, that he "testifies that he talked through F and B in June, 1874, but the proofs show that this occasion was as late as in the summer of 1876."

Here, again, the court is in error, for the proofs show no such thing. Mr. Musser testifies (D. Vol. 1, pp. 315–323) to *two* visits to Drawbaugh's shop, *both at times fixed by his book entries* relating to the business which took him there, and testifies clearly and explicitly to the occurrences at *both* visits, identifying the instruments which he saw and tested at the first visit, and also those witnessed by him at the second visit. There is nothing which shakes in the least the clear and positive testimony which he gives.

4. The court says that Drawbaugh not only had means of raising money during all the years of his alleged poverty and distress, "but that on many occasions he had means for investment and for speculation." So far as this statement relates to the period extending from the latter part of 1869 to 1880, it is gross error. He did not regard his invention as ready to patent till as late as 1870 or 1871, when instruments C and I were made; and if the court can show that at any time in the year 1870, or the ten years next following, he ever had means for investment or speculation, or ever invested or speculated during those years, to the extent of even one penny, we challenge the production of the evidence. The statement of the court below, on this point, is merely a loose, careless assertion, without one particle of proof to support it, and directly contradicted by all the testimony.

5. The court next states that Drawbaugh "was accustomed to prepare specifications of patents, and advertised himself as an inventor, designer, and solicitor of pat-

ents." Drawbaugh explains that, owing to his knowledge of mechanics, the country inventors in the vicinity occasionally came to him to get him to write out rough descriptions of their inventions *to aid their regular patent solicitors in understanding the ideas or devices of the inventors*, and that, finding he could now and then earn a few dollars in this way, he sought to secure, and did secure, a few jobs of this kind, but that he never acted as solicitor of patents, or attorney, before the patent office, in his own cases or any other. (D. Vol. 2, pp. 863, 864.) The Commissioner of Patents certifies that he never appeared in that office as attorney or associate attorney in any case. (See p. 775, D. *sur-rebuttal.*) A mere glance at Drawbaugh's letters (see, for example, pp. 245–6, D. *sur-rebuttal*) is sufficient to show that he lacked the necessary literary qualifications for the work of a patent solicitor. It is *manifestly* unfair to attach any importance to this trifling matter, which the evidence fully explains.

6. The court next charges that "*during the time he was experimenting on the talking machine*, and before he applied for a patent, he found time and materials for experimenting with and making *the Giffard injector for steam engines*, the *autograph telegraph*, the magneto dial telegraph, the magneto key, the automatic fire alarm, and the electric clock."

The essential statements here are grossly erroneous. He never experimented with a "Giffard Injector," but, *long before he entered upon the talking machine invention*, he devised an injector of his own, altogether different from Giffard's.

He never experimented at all upon any *autograph telegraph*, at *any* time. The automatic fire alarm was a mere thermostat, such as can be made for ten cents by any mechanic, and the fact that he made one has no bearing whatever upon the question of his financial means. The magneto dial telegraph and magneto key were instruments whose cost lay almost entirely in the *labor*, and not in the *materials*, employed in them. The electric clocks which he had prior to about 1876-7 were incomplete, rude and utterly inexpensive. There was but little actual expense to him, outside of the labor of himself and his nephew, George W. Drawbaugh, in any or all of the clocks made before Shettel and the Grissingers took hold of the clock inventions. All these devices, prior to that time, would not have cost for materials, *in the aggregate*, probably twenty dollars; and those materials were supplied at long intervals, little by little, through a period of at least seven or eight years. How manifestly unfair to array these things against him as though they had any importance or value in enabling us to estimate his pecuniary condition!

7. The court next says that "during this period he was a friend of Mr. Weaver, a patent solicitor, who frequently gave him advice and professional assistance, in return for mechanical services rendered by Drawbaugh, and who drew specifications for him for a measuring faucet and for the magnetic clock. If he was not competent himself to make an application for a patent, it cannot be doubted that, with the assistance of Weaver, he could have made a proper application at a trifling outlay, if any, beyond the fees of the office."

To say that this picture is overdrawn is to put the fact altogether too mildly.

Weaver's cross-examination shows him to have been a disreputable shyster, in whose ability or integrity Drawbaugh would have been a fool to confide. *Drawbaugh* did not employ him to draw specifications for the measuring faucet and magnetic clock, but the new faucet company and the clock company, the men who furnished the money for patenting those inventions, employed him for that service. (D. Vol. 2, p. 933, Ans. 992.) His relations with Drawbaugh were not those of a "friend," but only those of a mere acquaintance. Weaver's cross-examination shows convincingly that, on the occasion when he was brought to Drawbaugh's shop in March, 1876, by the axle company, to appraise their property, he attempted to cheat them out of a portion of it, and the proceeding consequently ended in a quarrel and his dismissal. His cross-examination further suggests a very strong suspicion that, when employed as a patent solicitor, he was in the habit of cheating his clients and filing applications for their inventions in his own name. (See C. Vol. 2, pp. 413 to 444.)

It is impossible that Drawbaugh should not have had some doubts or suspicions as to the character of this man, and incredible that he would have resorted to him to aid in patenting so valuable an invention as the telephone, or one so difficult to adequately describe and protect, and which required the best services of an able lawyer. To understand the character of Weaver, the court should read his cross-examination, for no abstract can do justice to it.

8. The court then refers again to the time and expense of Drawbaugh's electric clocks, and the cost of the gear-cutting machine which he devised and made in order to expedite the work, stating that "these clocks were built by him with his own tools, and out of his own money, and to build them economically he made a gear-cutting machine, which must have cost him more than it would to patent his telephone." There is not a par-

ticle of evidence as to the cost or character of this gear-cutting machine. For aught we know, it may have been, and probably was, a simple, inexpensive device. It was copied after one which Shapley lent him, when considering the question of going into the clock business—and the fact that the original machine was the property of a small country jeweler, and was carried back and forth to and from Drawbaugh's shop, shows that it was a small, portable device. Its alleged cost is a mere assumption of the court below.

9. At another point, referring to the testimony of numerous witnesses as to the very words which they heard through Drawbaugh's telephones prior to the date of Bell's invention, the court below says: "When witnesses undertake (as many of them do), to give the exact word or sentence heard in the instrument five or ten years before, when their attention was not called to the subject afterwards, *no hesitation is felt in rejecting such statements as utterly incredible*"!

A convenient way of getting rid of evidence! If no witness had remembered the words which he heard, the court would have said: "No word ever spoken through the instrument is even pretended to be remembered, and this is proof conclusive that none was ever heard;" but when the words *are* remembered, it merely waives aside the statement as "utterly incredible," and serves notice upon us, once for all, *that it will not believe a "myriad" of witnesses who testify in our favor*, although it will accept against us, as gospel truth, any loose statement, any half-remembered or imperfectly understood conversation of years before, any improbable or unjustifiable inference suggested by opposing counsel, any deposition, like that of Matthews, which even the deponent himself afterwards asked the court to disregard by reason of the vagueness and unsatisfactoriness of his memory, even to himself, and will go beyond all these things in order to make out a case against us, and *assume* facts, without evidence, such as that Drawbaugh knew of the article in "*The Manufacturer and Builder*" in 1869, and was, prior to that date, making *electric* experiments with a *non-electric* phonograph!

We do not wish to be understood as charging the court below in this brief with deliberate wrong-doing, but we do mean to be clearly understood as charging it with gross errors of fact and law, and with being manifestly too deeply prejudiced to weigh the evidence fairly, or even read the testimony correctly. When a court expressly refuses to believe a witness testifying to the words which he heard for the first time through a telephone—a startling event, likely to impress his memory—*but receives and accepts the very words of loose, casual conversations of years ago whenever they can be used against Drawbaugh*, it is evident that no known rule of law or evidence guides its deliberations.

One general conclusion is clearly derivable from a careful examination of the opinion of the court below, and it is as follows:

The court evidently started out with the idea of holding that the entire Drawbaugh story was a fraud and a lie, and that Drawbaugh never thought of a telephone till after the publication of Bell's invention.

It soon found itself driven from this position by unanswerable evidence, and was forced to admit that Drawbaugh was indeed experimenting with telephones or phonographs, from 1866, or before, till after 1876.

Compelled to admit that these experiments were *electrical*, the phonograph theory fell to the ground and the telephone alone remained.

The court then fell back upon the theory that the telephones thus proved to have existed years before Bell's invention were incomplete and unsatisfactory, *although the same witnesses whose testimony conclusively proved their existence, proved with equal conclusiveness their complete practical operation and identified the very instruments, which show for themselves that they are completed aud operative machines.*

At this juncture, met by demonstrative evidence which could not be explained away, the court announced that it would not believe a *myriad* of witnesses testifying to their positive and clear recollection of facts within their own knowledge; but would accept as true all kinds of trash—legal evidence or not—which could be found, suggested, or even, when necessary, *assumed*, against Drawbaugh.

The clear, simple and self-evidently honest testimony of Daniel Drawbaugh, however, still remained as an insuperable obstacle to this position. He must, therefore, be disposed of as a witness. Hence, it proceeded to charge him with writing a foolish autobiography, which the conclusive evidence of the original manuscript itself—an exhibit in the case—proved he did not compose. It assumed him to have been a comparatively well-to-do citizen, by mixing up his finsncial status *before* the telephone was in a patentable condition with his financial circumstances for years *after* that event, and by disregarding the unanimous testimony of hundreds of witnesses and misunderstanding and misstating proved facts; and, on these mistaken assumptions, it disposed of his whole deposition. Then, *although it had admitted that the testimony of the* *corroborating witnesses was honest, and was sufficient to overthrow the validity of the Bell patents,* it proceeded to disregard their corroboration *because it had thrown out the evidence of the principal*—Drawbaugh himself.

On the rehearing, although all the tested instruments clearly and emphatically proved their own complete operativeness, it proceeded to make two utterly erroneous assumptions about the reproduced instruments F—both of which assumptions were completely *disproved* by Professor Barker's testimony—and simply *ignored* all the other instruments, B, C and I, *although no such assumption could even be pretended as to them, and although they proved the case as completely as did F.*

It is not too much to say that such an attempt to answer the Drawbaugh case—the best argument that a judicial mind could discover or invent for the purpose—shows to a demonstration *that the Drawbaugh case cannot be answered.*

Calling attention to the three following appendices, marked A, B and C, wherein are discussed the questions of the "ram," the "flood," and the "negative evidence," and to the briefs filed herewith on the Bell patents, we respectfully submit the People's and Overland cases to the judgment of this court.

L. HILL,

Of Counsel for Appellants, The People's Telephone Co. and the Overland Telepone Co.

APPENDIX A.

THE HYDRAULIC RAM CONTROVERSY.

During the progress of this case a number of collateral issues have been raised by complainants and gone into so exhaustively and at such length of testimony, by both sides, as to cause one, in reading over the large portion of the record devoted to their consideration, to wonder whether, in fact, the speaking telephone or something else is the real subject of controversy.

Of these collateral issues none have been spun out at greater length than those raised in respect to the time of the ordering and to the time of the putting in of a certain hydraulic ram, which is admitted by both sides to have been ordered of and furnished by Mr. Drawbaugh for use on the Thomas Draper farm in the borough of Marysville, Perry county, Pennsylvania—nearly seventeen hundred pages of the record being devoted to these issues alone.

The facts and circumstances which gave rise to this ram controversy are both interesting and peculiar. We glean them from the deposition of Thomas Draper (D. Vol. 2, p. 1123.)

It appears that some time in the latter part of January, 1882, a certain person, representing himself to be a lawyer, called upon Mr. Thomas Draper at his home in Dover, Delaware, and requested a few moments' conversation with him concerning his knowledge of the invention of the telephone. That an inquiry should be made on this subject somewhat surprised Mr. Draper, and when he asked the lawyer how he found out that he, Mr. Draper, knew anything about it, he was informed that a man in Marysville had said that he heard Draper mention the fact that he had been to Drawbaugh's shop, at Milltown, and had seen the latter's talking machine. Not knowing the intentions of his questioner, and fearing that he might be called off somewhere as a witness, Mr. Draper was disinclined at first to give any information, but finally, upon being assured that if his evidence were needed his deposition could be taken by commission at his home in Dover, he consented to relate what he knew, as follows:

He said that in the year 1873 or 1874 he and his tenant, George W. Kissinger, who lived on his farm at Marysville, Pa., went over to Mr. Drawbaugh's shop, at Milltown, for the purpose of ordering a hydraulic ram for his farm; that on that occasion he was introduced by Mr. Kissinger to Mr. Drawbaugh and the ram matter was discussed; that Mr. Kissinger asked Mr. Drawbaugh how he was getting along with his talking machine, and the latter replied that he was getting along pretty well, though he lacked means to put it through; that Mr. Kissinger then told Mr. Drawbaugh that he ought to get him, Mr. Draper, to assist him, as he had plenty of money; that thereupon Mr. Drawbaugh took pains to show him, Mr. Draper, his instruments, talked through them to him, spoke of them as the greatest invention of the age, said they would take the place of telegraphy, etc., and intimated to him that he would like to have him go in with him, etc., etc.

This account of Mr. Draper appears not to have been much relished by his interviewer. He asked him if he was sure his visit to Mr. Drawbaugh was prior to 1876, and Mr. Draper replied that he knew it was, and that it was some time in 1873 or 1874. He also questioned him in regard to the kind of instruments he had seen at Mr. Drawbaugh's, got him to describe them as best he could, and remarked that it was a very singular thing that men in different parts of the country should hit upon the same kind of instruments. Mr. Draper told him that he always thought the patent the Bell Telephone Company was operating under was the Drawbaugh patent, and that Mr. Drawbaugh had gotten Bell to go in with him.

The lawyer said that Mr. Draper was mistaken, and then told him that he was an attorney for the Bell Telephone Company, informed him of the present suit, and remarked that Mr. Draper had missed a big fortune, and that he would not be manufacturing phosphate at

Dover if he had taken hold of the talking machine with Mr. Drawbaugh. On leaving, he told Draper that he need not be uneasy about being called as a witness, and that if the other party didn't need him his company certainly should not (D. Vol. 2, pp. 1129-40).

After this interview had taken place, Mr. Draper, feeling that some injustice was, perhaps, being done to Mr. Drawbaugh, sat down and wrote him the following letter, viz. (D. Exhibits 136).

OFFICE OF THOMAS DRAPER & CO.,
Manufacturers of Phosphates and Dealers in all kinds of
Fertilizing Material, Lime, and Grain,
No. 317 S. State Street,
DOVER, Del., Jan. 30th, 1882.

MR. DANIEL DRAWBAUGH.

Dear Sir: I was interrogated to-day by an attorney from New York or Boston in reference to what I know about your having invented a telephone, or talking machine, as you called it when you first showed it to me. When he first began to talk I thought he was a man you had sent down here, but I soon found my talk did not suit him, and when I tried to find out where he was from and what he wanted, he told me he was a lawyer from the opposite side from you, and that there was a big law suit pending over the telephone patent between you and the Bell Company. I told him I did (not) [D. Vol. 2, p. 1131, Q. 40] want to be called up as a witness, but I thought you ought to have the benefit of your invention. He asked me when I first saw yours. I told him I had never seen it but once, and I thought that was in 1873 or 1874, and that you showed me what you could do with it, and that you talked to me with it in an adjoining room, and that you said your only trouble was money to carry out your plan, and that you wanted me to take hold with you or let you have some money to carry out your plans. If you recollect, George W. Kissinger was with me at your place. He and I had a long talk about it afterwards. Now, I do not want to be taken from home, as I am getting old, but I do not like to see a man cheated out of his just rights.

Are you going on with your suit?

Ever Truly,
THOMAS DRAPER.

This letter conveyed to defendants the first intimation that such a man as Mr. Draper was in existence. The complainants, it appears, had found him out before from the man in Marysville, but this was the first the defendants had heard of him.

Just as soon as practicable after the receipt of the letter by Mr. Drawbaugh, Mr. Draper was put upon the stand by defendants, and gave a clear, powerful and convincing deposition, unsurpassed by any other in the whole case.

In it he explains the object of his visit to Drawbaugh's shop, describes with accuracy some of the talking machines which Mr. Drawbaugh showed him and talked through to him at that time, identifies such instruments (C reproduced and I) when they are again shown him, tells how Mr. Drawbaugh tried to interest him and induce him to lend the much-needed financial assistance to push the invention, and gives a very full account of the interview with the complainants' agent before being called to testify, and of his subsequent communication to Mr. Drawbaugh about that interview.

Concerning the object of his visit to Drawbaugh's, he says that Mr. Kissinger leased his farm and moved on it in the spring of 1874, and very shortly afterwards began to make complaint of the great distance his wife had to carry the water, and urged him to put in a ram to force the water from the spring up to the house; that it was in consequence of the urging of Kissinger that in the summer of 1874 he was induced to go with the latter to Drawbaugh to see about the ram.

There can be no doubt about when Mr. Kissinger leased the farm, as the original lease is in evidence, and is dated April 1, 1874 (D. Vol. 2, 1124).

Never has Mr. Draper varied from his original testimony about the date of the ordering of the ram and of his visit to Mr. Drawbaugh. When recalled by defendants he gives another reason for knowing it was ordered in 1874.

He says that at the particular visit to Marysville, during which the trip to Drawbaugh's was made, he went up into the woods with Mr. Kissinger and looked at some crooked white-oaks that were there, and remembers distinctly telling Mr. Kissinger that he wished he had those timbers at his home in Delaware to use in the construction of a vessel he was about to build (D. S. rej. 174).

This occurrence could not possibly have happened later than 1874, for it is conclusively proven by a book entry that the work of getting out the timbers which were actually used in the construction of that vessel was commenced on the 4th day of November, 1874 (Ibid, 171).

After giving his first deposition, Mr. Draper, it appears, was repeatedly visited by Mr. Comfort and others of complainants' agents, and interrogated about this visit to Drawbaugh's; yet all their powers of persuasion seem to have been unable to shake him in the slightest in regard to the time of that visit, for in a letter which he wrote to Mr. Storrow, complainants's counsel, May 1st, 1884, after complainants had had him and his wife and daughter up to Philadelphia (D. S. rej. 253), he says: "As I told you "when I was at your place, you are all alike to me; I "don't know who is entitled to a judgment, nor do I care, "so it goes right. This much I do know,—that I was "at Drawbaugh's in 1874, and saw his instruments."

In view of the fact that Mr. Draper testified to going over to Milltown with Mr. Kissinger in a spring wagon, Mr. Kissinger was called in to prove that the trip was made in a particular spring wagon, which he did not *buy* from Mr. Peter Kaffenberger till the fall of 1876 (Kissinger, C. Vol. 3, 2411, Q. 70). Though no confidence can be placed in Mr. Kissinger's memory about so inconspicuous a matter as the particular kind of a wagon he used for taking a drive in on any particular occasion ten years ago, the whole effort of the complainants was rendered entirely abortive by Mr. Kaffenberger's admission that he owned the particular wagon in question from the spring of 1874 till he sold it to Mr. Kissinger in the fall of 1876 (C. Fol. 3, 2476, Q. 4), and that Mr. Kissinger was quite in the habit of borrowing wagons from him (Ibid, X. Q. 18). So, even if Mr. Kissinger was right about the particular wagon he took Mr. Draper over to Milltown in, the chances are that he borrowed it from Mr. Kaffenberger for the purpose. In fact, his reputation as a borrower is well established. (Kaffenberger, C. Vol. 3, 2476; Harper, D. S. reb. 658; John H. Cowen, Ibid, 724-5; Champion, Ibid, 597; Shaffer, Ibid, 872.)

The testimony of Mrs. Anna E. Draper, wife of Thomas Draper, materially strengthens that of her husband, and negatives the complainants' theory.

She testifies that it was the habit of her husband to visit the farm at Marysville about once a year while Mr. Kissinger lived upon it (C. Vol. 3, p. 1883). Also that she accompanied her husband on the trip which he made to the farm in the fall of 1877, and that on no other occasion went either to the farm or to Marysville while Mr. Kissinger lived on the farm (Ibid, p. 1882).

Now, the complainants' theory is that the trip of Mr. Draper and Mr. Kissinger to Milltown to see Mr. Drawbaugh was made during this visit of Mr. Draper and his wife to the farm in 1877. It is significant, however, that Mrs. Draper does not remember anything about her husband going to Milltown on that occasion (D. S. rej. 207), nor of hearing, at that time, anything about Mr. Drawbaugh or his talking machine (Ibid, 209; Q. 9, 10), but her recollection is distinct that while she was at home on the farm at Magnolia, Delaware, Mr. Draper, after one of his Marysville trips, told her about meeting Mr. Drawbaugh and seeing his talking machine, and about Mr. Drawbaugh's wanting him to invest money in his said invention, and of her advising him not to go in with Mr. Drawbaugh, as he had business enough already without it.

If Mr. Draper had, as complainants contend, gone to Milltown while she was up to Marysville with him in 1877, it is more than likely he would have told her at Marysville, on his return from Drawbaugh's shop, of the remarkable things he had seen at Drawbaugh's shop, and of Drawbaugh's desire that he should invest, and these things she would have remembered; but she remembers nothing about any such occurrence at Marysville. On the contrary, she has distinct recollection that her first knowledge on the subject of Mr. Drawbaugh and of his talking machine was imparted at her home at Magnolia.

Mr. Draper's eldest son, Thomas B. Draper, also corroborates his father, and from his peculiar situation his testimony is entitled to the greatest weight.

He says that when Mr. Kissinger came down to Dover to see his father, during the Centennial Exposition of 1876, he heard his father and Mr. Kissinger discussing the ram (D. S. rej. 206, Q. 3), and that before that time he heard his father at home, on the farm at Magnolia, in the presence of his mother, brothers and sisters, speak of having visited Mr. Drawbaugh's shop to order a ram, and of having at that time seen a talking-machine there. (Ibid. Q. 5, 6.)

Now there is not the remotest probability of this witness being mistaken. He was never at Marysville from the time he moved away from there to Delaware with his father in the year 1867 (Ibid. 207, Q. 10), and he never saw Mr. Kissinger after so moving away, except on the occasion of this visit of the latter in 1876 (Ibid. Q. 9).

He cannot be in error about the time of Mr. Kissinger's visit to his father's, as Mr. Kissinger himself testifies he went down from the Centennial Exposition in 1876, and was never there on any other occasion (C. Vol. 1, X. Q. 139, 140), and Mrs. Draper, when called by complainants, testifies to the same effect (C. Vol. 3, p. 1882, Q. 14). The conversation, then, which the witness heard between his father and Mr. Kissinger about the ram must have occurred in 1876, as it could not, by any possibility, have occurred at any other time; and the fact that the witness remembers hearing his father tell about going to Drawbaugh's to order the ram and seeing the talking machine long before Mr. Kissinger came down to Magnolia, and, as the witness says, prior to the building of the "Anna E. Draper" in 1875 (D. S. rej. 206, Q. 6), the conclusion is irrestible that his father's testimony about the ordering of the ram in 1874 is correct.

As against this clear and positive testimony of Mr. Draper, and the strong corroboration of his wife and son, the complainants offer the testimony of four witnesses on the subject of the *ordering* of the ram, viz.: George W. Kissinger, his son, George Franklin Kissinger, and his son-in-law, James C. Zimmerman, and Herman J. Eppler.

The testimony of tne son and son-in-law is loose, vague, indefinite, and unsatisfactory, and that of Eppler unreliable. George W. Kissinger's we will consider further on at length.

All that the son, George Franklin, has to say is, that his father and Mr. Draper went over to Drawbaugh's the fall before the ram was put in, "if I am right." He does not pretend to have seen them go, nor to have seen them come back, nor to have been told they were going there. He simply says in answer to the question: "How many "seasons before the ram was put in was it that they "went over there about it? It was the fall before, if I "am right" (C. Vol. 1, 583, Q. 9). No weight can be given testimony so vague and indefinite in character as this. More than this, he was asked in cross-examination how he fixed the time, and he replied that he and the other members of the family had been talking about the matter, and had agreed upon the date (C. Vol. 1, 586, Q. 42).

The most that the son-in-law, Zimmerman, can say on the subject is that his father-in-law *told* him in the fall of 1877, while Mr. Draper was there on the farm, that he had been over to Drawbaugh's to see about the ram (C. Vol. 1, 631). If he testifies truly to the fact that Kissinger made the declaration about having been to Drawbaugh's to order the ram he has probably mistaken the date, and it was in 1874, as Draper testifies. During the last-named year he lived in Perry County (Ibid. 624, Q. 25), and it is probable he was frequently at Mr. Kissinger's house, as his wife was the latter's daughter. Kissinger may then have made the remark to him.

His memory of facts and occurrences is not good, and his ability to go wrong about Draper's visits, and mistake one for another, is shown by the circumstance that while he testified he was living in Mr. Kissinger's house from January, 1876, to the spring of 1880 (Ibid. 627, Q. 50–54), he cannot remember of Mr. Draper visiting the farm prior to the fall of 1877 (661, X Q. 416), though the latter is shown to have been there also in February of 1877 (Draper D. S. rej. 176, Q. 42), (Kissinger C. Vol. 3, p. 2421, X. Q. 156), and he swears most positively that Mrs. Draper was never up to the farm with her husband (C. Vol. 1, 650, X. Q. 291), though it is proven beyond question that at the very time he swears Kissinger told him he had ordered the ram, Mrs. Draper was living there in the same house with him, and had been for about a week (Mrs. Draper, C. Vol. 3, 1882, Q. 11), (Draper D. S. rej. 183, X. Q. 57). So, too, he said, "it ran in his mind" that Mr. Kissinger brought Mr. Drawbaugh and the ram from Milltown on the 4th of November, 1878 (C. Vol. 1, 650, X. Q. 292), but Mr. Kissinger swears positively he didn't bring the ram at all (C. Vol. 3, p. 2408, Q. 42), and Cyrus Kissinger, that the ram was brought a week before Mr. Drawbaugh came and some time before Mr. Zimmerman's date (C. Vol. 2, 1471, Q. 81). Nor does his character seem better than his memory, for he admits that he seduced his wife, and was brought in and forced to marry her by a law officer four days after her first child was born (C. Vol. 1, 624, X. Q. 118–130), and he also admits so have frequently been in company with complainants' agent and detective, Mr. John C. Comfort, which is, perhaps, even worse.

The deposition of Herman J. Eppler is so filled with contradictions, inconsistencies, and evasions, and his bias in favor of complainants is so apparent and ever present, that the true value of his testimony can hardly be appreciated, except from a perusal of his whole deposition from beginning to end.

It is a significant fact that, though called to Philadelphia by complainants, according to his own admission, in February or March, 1883, while complainants were taking their testimony in reply (C. Vol. 3, 2187, X. Q. 70), and while they were putting in testimony on the subject of this ram, he was not examined at that time, and in fact not put upon the stand until after defendants had put in their sur-rebutting evidence, and when the complainants were just about closing their evidence in sur-rejoinder—more than a year afterward.

During this long interval of time Mr. Eppler seems to have been frequently in consultation with complainants' agents and witnesses, and upon reading his testimony one is strikingly impressed with the apparent effort to make it fill out and substantiate complainants' theory.

He testifies that he was the agent in charge of Mr. Draper's Marysville property from the spring of 1877 till the latter part of January, 1882; and that for a month or two before the papers appointing him agent were made out, there was a verbal agreement between him and Draper concerning this agency; that Draper visited Marysville in the spring of 1877, and again with his wife in the fall of 1877; that on the occasion of Draper's visit in the fall of 1877, Mr. Draper and Mr. Kissinger stopped at his shoe store in Marysville, and said they were going over to Milltown to order a ram for forcing water up to the house on the farm; and that on the evening of the same day, after their return from Milltown, Draper and Kissinger came again to his shop, and told him that they had ordered the ram, and that it was to be put in soon (C. Vol. 3, 2184, Q. 44; 2263, X Q. 621).

Were this witness a truthful and reliable person, it would be difficult to reconcile his statements about the ordering of the ram with defendants' theory, but inasmuch as his testimony shows him to be a person upon whose statements no dependence can be placed, the conclusion is inevitable that his story is a complete fabrication and unworthy of credit.

Knowing the witness to have been the agent of Mr. Draper at a period important in the history of this Kissinger ram, Mr. Hill, as counsel for defendants, visited Mr. Eppler at his place of business at Baltimore in June, 1883, for the purpose of seeing what light the latter might be able to throw upon the ram controversy; and learning from him that Mr. Storrow, complainant's counsel, and their agent, Mr. Comfort, had been there previously, and had been given a number of letters and papers bearing upon his agency, got the witness to give him an order upon Mr. Storrow for permission to examine said letters and papers, but, fearing that Mr. Storrow would not show him the papers, also took the written statements of the witness as to what they contained for use as a basis for a possible motion to compel the production of the papers for inspection.

The written order on Mr. Storrow, and the written statements of the witness, all signed by him, are as follows:

Baltimore, Md., June 27, 1883.

J. J. Storrow, Esq.,
40 State St., Boston, Mass.

Dear Sir,—Please permit Lysander Hill, Esq., to see and take copies of all the papers and the books which you and Mr. J. C. Comfort obtained from me during the past six months. H. J. Eppler.

BALTIMORE, June 27, 1883.

"In the written agreement between Thomas Draper and George W. Kissinger, dated not later than April 1st, 1877, as I remember it, there was a clause to the effect that said Kissinger was to keep the ram in repair. The said paper is now in custody of J. J. Storrow, Esq."

H. J. EPPLER.

BALTIMORE, MD., June 27, 1883.

I let J. J. Storrow and J. C. Comfort, several months ago, have eight letters, a written agreement, and an account book. The letters were from Thomas Draper to me. The agreement was between Draper and George W. Kissinger. The account book contains accounts between me and Draper, relating to my having charge of his farm during a portion of Kissinger's tenancy. For the use of these papers said Storrow and Comfort paid me $25, of which $5 was paid me for one letter. The agreement was dated, I think, either in January or April, 1877, and contained a reference to a hydraulic ram. One of the letters referred to said ram, and the other letters may have contained references to said ram, but I do not remember whether they did or not. I think the letter referring to the ram was dated some time in 1877.

H. J. EPPLER.

When cross-examined, he is questioned in regard to this interview with Mr. Hill, and, as we shall see, gives an entirely different and contradictory account of things from that contained in his written statements above quoted. He is asked (X. Q. 308) if he told Mr. Hill how many or what papers Mr. Comfort or Mr. Storrow had obtained from him, and he replied he had no recollection of doing so. His written statement, however, shows that he informed Mr. Hill that he "let J. J. Storrow and J. C. Comfort, several months ago, have eight letters, a written agreement and an account book."

He is asked (X. Q. 412) if he told Mr. Hill anything about the date of the contract between Mr. Kissenger and Mr. Draper, or about the contents of that contract, and he replies, "I don't recollect that I did." His statement to Mr. Hill, however, shows that he *did*.

He is asked (X. Q. 413) if he didn't tell Mr. Hill that the contract was not dated later than April 1, 1877, and that it contained a clause to the effect that Kissinger was to keep the ram in repair, and he swears that he did not make any such statement to Mr. Hill; and further, that he never had the impression on his mind that that agreement was not dated later than April, 1877 (X. Q. 418), nor that it was dated Jan. 1877 (X. Q. 420), nor that there was a clause in that agreement that Mr. Kissinger was to keep the ram in repair (X. Q. 416), but his written statement given to Mr. Hill contradicts all of this.

He is asked if his recollection always was that he first heard or knew of the intention of Mr. Draper and Mr. Kissinger to put a ram in in Nov., 1877 (X. Q. 537), and he replies that that was always his clear and positive recollection, but his written statement shows that his recollection, at the time Mr. Hill came to see him, was that it was as early as April 1, 1877, when a contract between Kissinger and Draper was entered into for keeping the ram in repair. He is asked if he did not make such contradictory statement to Mr. Hill, and he denies it (X. Q. 439).

He is asked (X Q. 444) if he always had a clear recollection that the visit of Draper and wife occurred in the fall of 1877, and that his first knowledge of the intention to put in a ram was obtained during that visit of Draper and his wife, and he answers he had; but the statement given by him to Mr. Hill shows quite the contrary.

He is further asked if it has always been his memory, from the time he gave the lease or agreement to Mr. Storrow or Mr. Comfort, that said lease or agreement was dated in the latter part of 1877, and he replies that such has been his memory not only from the time mentioned but also ever since he first got the lease (X. Q. 489); but here again he is contradicted squarely by the paper given to Mr. Hill a year previous, which shows that his statement was—we know not about his memory—that said agreement was dated either January or April, 1877.

He is further asked, specifically, if he did not tell Mr. Hill that the agreement was dated not later than April 1, 1877 (X. Q. 509), and he answers that he did not, though his answer is contradicted *in terms* by his written statement.

He further says that he knew perfectly well, at the time Mr. Hill came to see him, that the agreement was dated in December, 1877 (X. Q. 513), which is a pointed admission of his inability to tell the truth, in view of the flat contradiction of the written statement.

He is asked whether it was his memory at the time Mr. Hill came to see him that there was a clause, either in the lease or in the agreement, to the effect that Kissinger was to keep the ram in repair (X. Q. 514), and he replies that was not his memory, and that there was nothing said about the agreements mentioning the ram. But one of his written statements says that the agreement contained a reference to a hydraulic ram, and the other a clause to the effect that Kissinger was to keep the ram in repair.

He further testifies that he did not tell Mr. Hill there was anything in the agreement about the ram, but did tell him there was a reference to the ram in one of the letters which Mr. Storrow took (X. Q. 519). But upon referring to his written statement No. 2, made to Mr. Hill, we find that in it he says that besides the reference to a hydraulic ram in the agreement, there was also a reference to said ram in at least one, or perhaps more, of the letters, thus showing conclusively that the agreement and letters were separately considered by him when he made such statement.

He is further asked if he did not state to Mr. Hill either that the agreement or the letter contained a clause to the effect that the ram was to be kept in repair, and he replies that nothing was said about the word *repair*, but only that the letter mentioned the ram, wherein, again, he is positively contradicted by his written statements.

The above are some of the many instances found in his deposition wherein his testimony given for complainants is directly contradicted by his written statement made to defendants' counsel a year previous to his examination. And it should be noted that all these contradictions were drawn from him on examination, before the written statements were produced and shown him, which demonstrates either that he deliberately lied to Mr. Hill when the latter took his statements down, and forgot about making the statements, or that he is a person of no memory and in the habit of making reckless statements about matters in regard to which he knows nothing, his testimony being worthless in either view.

Upon the production of the papers, he is forced to admit the genuineness of his signature, that being a matter easily proved by extrinsic evidence, but denies that he ever made any such statements as are embodied in them, admitting only that they were read to him, and that he looked at them and signed them.

After casting this reflection upon counsel for defendants, who prepared the papers under his direction, he proceeds to justify and excuse any misstatements that may have been contained in the papers on the ground that at the time they were written he was worried and worn out from loss of rest in attending his wife, who then and for eighteen months previously had been sick. But when it is borne in mind that at the time these statements were made he was at his shoe store in Baltimore attending to his ordinary duties there; and that but a short time previous, and while, as he alleges, his wife was still sick, he received several visits from complainants' counsel, Mr. Storrow, and complainants' agent, Mr. Comfort, and he made several trips to Harrisburg and Philadelphia with these gentlemen—about all which he pretends to have a clear recollection—his alleged attention to his wife, and the worry consequent thereupon, does not strike one as being a very reasonable or satisfactory excuse.

Moreover, while he is unable to testify truly to what he told Mr. Hill, and to what the latter put down upon paper under his direction, he is able to testify quite circumstantially about the other unimportant paper which he signed and gave Mr. Hill on the same day, viz.: the order upon Mr. Storrow for the papers and book.

The inability of the witness to give two similar accounts of the same event crops out all through his deposition. For instance, in giving an account of his trip from Baltimore to Marysville, to hunt papers for complainants, he says in X. Q. 135 that he went up in the morning from Baltimore and came back the same evening; while in answer to X. Q. 137 he says in regard to the same trip that he left Baltimore on the *night* train, but could not tell what time he left, though he knows it *was late at night*. So, too, in regard to the money that Mr. Storrow and Mr. Comfort paid him for the papers he gave them. He testifies (X. Q. 198), when cross-examined by Mr. Jacobs, that he never received, either from Mr. Storrow or Mr. Comfort, any money for any papers, or for the use of any papers, but in another part of his deposition, while being cross-examined by Mr. Hill, he swears that Mr. Comfort, between Mr. Hill's two visits, paid him $20 for the *use of* papers (X. Q. 312); and again, that Mr. Comfort gave him $20, not as security, but *for the use of* papers (X. Q. 316), and the written statement (No. 2) which he gave Mr. Hill again catches him by reciting that, "for the use of these papers said Storrow and Comfort paid me $25, of which $5 was paid me for one letter."

On the same subject he testifies (X. Q. 190) that when Mr. Comfort gave him the $5 for the letter of December 18, 1877, he told him it was as security until he returned the letter, and, in another place, that the $25 paid him was for the use of the papers till the complainants were through with them, after which they would be returned to him (X. Q. 315), plainly indicating that the ownership in the papers had not passed from him; but the receipt signed by him, which the complainants have put in evidence (C. Vol. 3, 2286), shows that there was an absolute sale of the letters and papers by him, and that they were to be used in this suit, if needed, and afterwards *to be the property of complainants.*

The unreliability of the man is shown in another instance. He testifies (X. Q. 157) that the *six or seven letters* which he gave Mr. Comfort, or Mr. Storrow, at Marysville, and the letter of December 18, 1877, which he afterwards gave to them, are the only letters or papers of any kind that he ever gave to Mr. Comfort or Mr. Storrow, or any one acting for complainants; but he afterwards contradicts himself by stating that at the second visit Comfort made at Baltimore he gave the Kissenger-Draper agreement to him (X. Q. 567); and he is further contradicted by the admission of complainants' counsel (C. Vol. 3, 2287) that he had given them *nineteen letters*, besides the Draper-Eppler power of attorney of March 8, 1877, and the Draper-Kissinger agreement of December 4, 1877.

Another contradiction of himself is found in his testimony relative to the time when he gave Comfort the letter of December 18, 1877. He says (X. Q. 148) that Comfort got that letter in August or September, 1883, some time after his wife died, and that she died some time in July, 1883; but in another place he swears with equal positiveness that he put that letter in Mr. Comfort's hands and received $5 for it a couple of months *prior* to Mr. Hill's visit to him (X. Q. 336), and his written statement No. 2, signed by him June 27, 1883, and given to Mr. Hill, on that date, is to the same effect.

In fine, the whole of his testimony shows him to be utterly unreliable, and a person who recklessly or intentionally makes a different statement upon a given subject every time he is interrogated about it.

The amount of influence which the complainants have brought to bear upon him can only be conjectured from the extent of his association with their agents and the amount of money he admits having received from them at different times.

He admits that Mr. Comfort came to see him at Baltimore early in 1883, and asked him to go to Harrisburg and Marysville to look up some papers; that afterwards Mr. Storrow and Mr. Comfort came to see him at Baltimore and arranged for a meeting in Harrisburg; that he went to Harrisburg and thence to Marysville with them and thence back, alone to Baltimore; that subsequently he again met Mr. Comfort and Mr. Storrow in Harrisburg in response to a telegram, and went from there to Milltown with Mr. Storrow and thence back to Harrisburg; that after that he accompanied Mr. Storrow to Philadelphia, where the complainants were taking their testimony, and there had a consultation with complainants' counsel, Messrs. Storrow and Smith; that Mr. Comfort came to see him again at Baltimore; that after that he went to Philadelphia again and staid two or three days and there met Mr. Brooks, another of complainants' agents, and that he again met Mr. Brooks at Marysville afterward and also had a talk with Mr. Zimmerman, Mr. Kissinger's son-in-law. Besides all these consultations with complainants' counsel and agents he appears to have been at Philadelphia for a considerable period prior to the giving of his deposition, and even after his deposition was taken, he appears to have been at Harrisburg in consultation with the complainants while they were taking their closing testimony. (See Kissinger, C. Vol. 3, 2419, X. Q. 139.)

How much money he has actually received will probably never be known.

He admits the payment to him of $5 by Mr. Comfort at Baltimore for the letter of Dec. 18, 1877; another payment of $15 by Messrs. Storrow and Comfort, at Harrisburg (X. Q. 212); another payment of $25 by Mr. Comfort at Baltimore, of which $20 was for the use of papers and $5 for between one and two hours' time talking to Mr. Comfort (X. Q. 321); another payment of $25 made him by Mr. Comfort at Philadelphia two or three weeks prior to his examination (X. Q. 328); another payment of $15 by Mr. Storrow at the time last mentioned (X. Q. 330); another payment of $5 by Mr. Comfort and another of $5 by Mr. Storrow (X. Q. 331).—the last five dollars received from Mr. Comfort witness having asked for.

These payments were not intended to cover expenses, as the witness says complainants' agents always looked out for his expenses separately, and entertained him in first-class style at the "Hotel Lafayette" whenever he was at Philadelphia (X. Q. 348).

As against the clear and positive testimony of Mr. Draper, the testimony of such a biased, unreliable and untruthful witness as this certainly cannot stand. Complainants will no doubt make a great point of the fact that witness was the agent of Mr. Draper and hence in a position to be informed about the ram matter, but he himself testifies that he had nothing whatever to do with the procuring or putting in of the ram, and that it was a matter that lay entirely between Mr. Draper and Mr. Kissinger (C. Vol. 3, p. 2263, X. Q. 620).

The only remaining witness relied upon by complainants to prove the date of the ordering of the ram is Mr. George W. Kissinger, the person who accompanied Mr. Draper to Mr. Drawbaugh's shop when the ram was ordered.

In entering upon a discussion of Mr. Kissinger's evidence, we feel our entire incompetency to do the subject justice.

The ignorance, stupidity, lack of memory, and confessed untruthfulness of the man can only be fully appreciated from reading his two remarkable depositions from beginning to end.

Nothing could be more abortive than the attempts made in his first deposition to fix the dates of Draper's visits to the farm, and the date of the trip which he and Draper made together to Drawbaugh's shop.

He says, in one place (C. Vol. 1, 564, X. Q. 132), that Draper's first visit to the farm was near on to two years after he (Kissinger) moved on to the farm, which would bring it some time in 1876. In another place (571, X. Q. 200), that this first visit was in the spring or early fall of the year after he moved on the farm, which would bring it in the spring or fall of 1875. As to the second visit of Draper, he says, in one part of his deposition, that he thinks that it was about eighteen months after he moved on to the farm (570, X. Q. 200), which would bring it in the fall of 1875, while in another part he swears that this second visit was in the fall of 1877 (570, X. Q. 191). He says that Mr. Draper's third visit was in the fall of 1878 (570, X. Q. 193).

Now, as a matter of fact, we know from the testimony of Draper that his first visit to the farm was in the summer or fall of 1874, and prior to Nov. 4, 1874 (Draper, D. S. rej. 171 and 174, and 33), and not in '76, nor in the winter or fall of '75, as Kissinger testifies; that his second visit was in April, 1875 (Draper, D. S. rej. 175; Exhibit Kissinger, Draper Letter, May 30, 1875, D. Exb. 138, D. S. rej. 169; Kissinger admission, 2d Dep., C. Vol. 3, 2045), and not in the fall of '75, nor in the fall of '77, as Kissinger testifies; that Draper didn't visit the farm at all in 1876, and that he made his third visit in Feb., '77 (Draper, D. S. rej. 176), and not in the fall of '78, as Kissinger testifies.

In regard to the trip to Drawbaugh's, Kissinger, in his first deposition, testifies that it was on the occasion of Draper's second visit to the farm that they went over there (571, X. Q. 202), which would bring it, according to his other testimony given in the same deposition, either in the fall of 1875 or in the fall of 1877, and according to the fact in regard to the second visit, in April, 1875; but he seems to have even been unable to positively settle upon either of these dates, for in a letter which he wrote to Mr. Jacobs, one of defendant's counsel, in 1883 (C. Vol. 3. 2423), after he had given his testimony and after he had had full opportunity to calmly consider the matter, he volunteers the statement that he thinks it was in Feb., '77, when he and Draper went over to Drawbaugh's shop to order the ram.

Concerning the letter which he wrote to Mr. Jacobs, he commits the vilest and most barefaced perjury, and admits it, too. He is asked, while on the stand the second time, whether since he gave his first deposition he had always felt entirely certain that the trip to Drawbaugh's shop with Mr. Draper was made in the fall of 1877, and he replies that he has (C. Vol. 3. 2420, X. Q. 148). He is then asked if he did not, in Feb., 1883, inform Mr. Jacobs that he thought that that trip to Drawbaugh's shop was made in February, 1877; and he replies, positively, that he did not so inform Mr. Jacobs (Ibid. 2423, X. Q. 168).

The letter is then shown him, and, finding himself cornered, he gets up and makes a most excited and incoherent speech, protesting his friendship for Mr. Drawbaugh, but denouncing the defendants in the most abusive terms, and charging them with the gravest offenses (Ibid. 2425); but when he gets all through and quiets down he is put the following question, framed so as as to give him an opportunity of creeping out of his difficulty on the plea of forgetfulness, viz.:

"X. Q. 176. And then you forgot all about the letter, and forgot that you had ever thought that the time of the visit which you and Draper made to Drawbaugh's shop was in February, 1877, did you not?"

Yet not availing himself of the chance offered him, he confesses to barefaced perjury by the reply:—

"I never forgot the letter: I knew that letter would come up." After which he jumps up, and says he is "going home," and refuses to give any further explanation of his testimony.

At a subsequent day he is made to retract one by one the charges he had made against the defendants, and to admit there was no truth in them (C. Vol. 3, 2442, X. Q. 277 to X. Q. 291).

This is the character of the man chiefly relied upon by the complainants to rebut Mr. Draper. Will the court place any reliance upon his statements after such an exposition? We think not.

But we are not yet through with his testimony about Draper's visits. He says in his first deposition (574, Re-X. Q. 229) that the ram was first put in in '78, and that the first fall after the ram was put in Draper and his wife came up to the farm.

This would make Draper's visit, with his wife, in the fall of '79, but Draper (D. S. rej. 183, X. Q. 57) and Mrs. Draper, when called for the complainants (C. Vol. 3, 1881), prove conclusively that they were up there together in November, 1877, and at no other time, which, according to complainants' theory, makes that visit a year *before* the ram was put in, and not a year *after*, as Kissinger testifies. Again, in his first deposition (574, X. Q. 229), he testifies that the fall after Draper and his wife were up at the farm, Draper and his daughter came up. This would make the visit of Draper and his daughter in 1880, and two years after the ram was put in. But Draper (D. S. rej. 183, X. Q. 57) and his daughter, Virginia M. E. Draper, when called by complainants (C. Vol. 3, 1886), prove beyond question that their visit to the farm together was made in November, 1878, instead of in 1880, as Kissinger testifies, the date of their visit being positively fixed by a letter received by Miss Draper while she was there, and which is in evidence (C. Vol. 3, 1887).

Reviewing these attempts of Kissinger to fix the dates of Draper's visits, and his efforts to associate events and occurrences with those visits, we find that in not a single instance has he even guessed correctly. What value can such testimony have if even honestly given, and how can it stand in view of the clear, positive, and corroborated evidence of Mr. Draper? We affirm that a satisfactory decision of this whole ram controversy can be made upon the testimony of the few witnesses we have considered.

There are scores of others on both sides who testify to the putting in of the ram and the preparations made for it, and to other remote matters admitted to have happened subsequent to the ordering of the ram, but those we have treated are the only ones who speak to the vital point, *i. e.*, the date of the ordering of the ram.

Should the court, however, conclude to go further, we are prepared to show that the great preponderance of evidence on even the remoter points goes to confirm Mr. Draper in his date, and to refute completely the theory of the complainants.

Before entering upon a further discussion of the evidence it will perhaps be well to inform the court of the facts which are not controverted in regard to the ordering and putting in of the ram, and also to indicate the theory of the defendants, and what we conceive to be the theory of the complainants in respect to those matters.

FACTS NOT CONTROVERTED.

It is amply proven and substantially admitted on both sides that the Draper farm which figures in this controversy is located within the limits of the borough of Marysville, Perry county, Pennsylvania, and just back of the village of Marysville, on what is called the "Valley Road," a road leading from the Susquehanna River through the village of Marysville, and up the Fishing Creek Valley; that from the 1st of April, 1874, to March 1880, Mr. George Kissinger lived on that farm as the tenant of Mr. Draper; that at a time, about which there is controversy, Mr. Draper, accompanied by Mr. Kissinger, went over to Milltown and ordered of Mr. Drawbaugh a hydraulic ram, to be placed on the Draper farm; that preparatory to the putting in of the ram, timber was cut and bored on the Draper farm for use as piping between the spring and the ram; that iron piping was also procured to convey the water from the ram up to the house; that trenches were dug to receive the piping; and that, finally, the ram was brought to the farm, set up, and put into operation.

It is also admitted that there never was a ram on the

Draper farm prior to the ordering of the one by Draper and Kissinger of Drawbaugh, and, further, that no ram was ever procured for the Draper farm except from Mr. Drawbaugh.

THE DEFENDANTS' THEORY.

The defendants' theory is that the ram was ordered in the summer or fall of 1874; that the timber for the wooden piping was cut, bored and laid in the years 1875 and 1876, commencing in the winter and spring of 1875; that old metal pipes, for use between the ram and the house, were procured some time between the spring of 1875 and September, 1876; that the ram was brought over from Mr. Drawbaugh's between harvest and corn-cutting time in 1876; that it was put in by Mr. Drawbaugh in the fall of 1876, and not later than September of that year; that it remained in till the fall of 1878, giving very little satisfaction, sometimes working and sometimes not, when it was sent to Mr. Drawbaugh's shop to be cleaned and repaired, after which it was brought back and put in again, in connection with new iron pipes, procured as substitutes for the old rusted and leaky iron pipes first put in, Mr. Drawbaugh superintending the job.

THE COMPLAINANTS' THEORY.

The complainants, on the other hand, contend that the ram was not ordered till the fall of 1877; that the timber for the wooden piping was not cut and bored till the winter of 1877–78 and spring of 1878; that no metal piping was procured till July, 1878, and that the ram was not brought over from Mr. Drawbaugh's shop and put in by the latter till early in November, 1878.

THE EVIDENCE IN SUPPORT OF DEFENDANTS' THEORY.

We will first consider the evidence offered in support of defendants' theory. But before going into that, the attention of the court is directed to the photographs, marked "Defendants' Exhibits Photographs of Kissinger Place, Nos. 1 to 6 inclusive," of which profert was made at page 246, Defts.' Sur-rej., and also to the plan marked "Complainants' Exhibit Ives Survey Draper Farm," printed on page 2450 of Vol. 3, Complainants' Testimony. These are referred to at this point in order that the court may become somewhat familiarized with the Draper farm and its surroundings. and be able to, with more facility, understand the testimony.

Photograph No. 1 is a view looking toward the west, and taken from the edge of the field lying immediately east of the Kissinger house toward the village of Marysville. The fence at the extreme left of the picture runs parallel to and borders the "Valley Road." To the right, and some distance back from the road, stands the stone house formerly occupied by Mr. Kissinger, Mr. Draper's tenant. The house, it will be observed, is located very near the top of a hill, and between it and the barn —shown at the right of the picture—is quite a deep ravine. The distance between the house and the barn is considerable, being nearly 400 feet according to the scale of the Exhibit Ives Survey. Back of the barn is seen the mountain.

Photograph No. 2 is taken from the white fence shown at the side of the house, Photo. No. 1, and looking toward the north-east, the Chestnut Grove Cemetery, concerning which some testimony has been introduced, being shown in the distance somewhat to the left of the center of the picture, also the ravine at the foot of the hill on which the cemetery is located.

Photograph No. 3 is a front view of the stone dwelling-house shown in Photo. No. 1, looking north, and taken from the gate which opens out into the Valley Road. This view gives an idea of the distance of the house from the road, and shows clearly the cupola or observatory on top of the house and the roofed porch at the front of the house, both of which objects figure somewhat conspicuously in the testimony.

Photograph No. 4 is a view taken from the north-east corner of the stone house, looking in a slightly north-westly direction. This view shows the barn, the ravine or hollow between the barn and the house, the spring-house to the left of the barn, and also the ram-pit—the latter being located close to the post and rail fence, and beyond and nearly in line with a partly dead apple-tree having an inclined trunk.

Photograph No. 5 represents a view taken from the rail fence, shown in Photo. No. 3 as extending horizontally across the picture from the east side of the barn, and looking in a south-westerly direction. The ram-pit is shown in the foreground at the extreme right, close to the fence, the apple-tree with the inclined trunk just beyond it. The rear of the stone house is also shown, and where the man stands with a handkerchief in his hand, to the right of the house, is located the projecting iron pipe from which the water forced up by the ram is discharged, said pipe being shown very faintly to the right of the handkerchief. Above the top of the hill, to the extreme right, the tops of the trees in the peach-orchard are discernible.

Photograph No. 6 represents a view taken from a point near the bottom of the hill and looking in a north-westerly direction. In the foreground, near the rail fence, the square walled-up ram-pit is shown, the top of the ram itself being visible. The large building on the right is the barn, and the man with the uncovered head stands in the barn-yard. The building at the extreme left, in front of which a man is shown sitting on the fence, is the spring-house. The central building is the one marked "Log shed" in the "Ives Survey" plan.

Both sides agree, and the evidence negatives any other conclusion, that until the ram was actually ordered of Drawbaugh by Draper and Kissinger there was no piping of any kind procured or contracted for, no trenches dug, and no preparatory work whatever done on the Draper farm in expectation that a ram would be put in. All these things are admitted to have been done after the ram was ordered, whenever that was.

If, therefore, the court shall find from the evidence that prior to the fall of 1877—the time when complainants claim the ram was ordered—timber was cut and bored for the wooden piping, or that the iron pipes for the ram were procured, or that the ram was brought, or that it was put in and set in operation on said farm, the theory of the complainants in regard to the only material point in the controversy, namely, the date of the ordering of the ram, will be completely annihilated, and by just so much earlier than 1877 as the preparatory work for the ram, or the actual putting in of the ram, shall be proven to the court to have been done, by just so much will the clear and positive testimony of Draper to the ordering of the ram in 1874 be corroborated and strengthened.

A large number of witnesses have been examined in support of defendants' theory, and their testimony will now be considered as briefly as is consistent with clearness.

We have already noted what Mr. Thomas Draper testifies concerning the ordering of the ram. What he has to say about the preparations made on the farm after the ram was ordered will now be adverted to.

He testifies that he was in Marysville in April, 1875 (D. S. rej. 169; A. 18, 173; A. 32), and that while there on that occasion Mr. Kissinger showed him some small chestnut saplings, six or eight in number, which he had cut and hauled up near the barn wall, and which he said were for piping to run the water from the spring to the ram, and he also showed him an auger which the pipe boring was to be done with, but which Mr. Kissinger said was out of fix; that he told Kissinger that by the time he bored these logs there would be nothing but sap left, and that he, Draper, didn't wish to put in piping of that kind, and that they had better be used for something else or larger ones cut. He further testifies that he told Kissinger that on his way back to Philadelphia he would see if he couldn't get some terra-cotta piping that would answer as well as the bored chestnut logs, and perhaps would be cheaper, his idea being that terra-cotta piping could be used both between the spring and the ram and from the ram to the house; that when he got to Philadelphia he went over to Camden to order some decking for the "Anna E. Draper," a new schooner he was then building, and seeing a pile of terra-cotta piping lying on the pavement, went in and inquired whether it would do for use in connection with the ram, and was informed that it would not do; that it might answer to convey the water from the sping to the ram, but would not do to go from the ram up to the house; that it wouldn't stand the pressure between the latter points.

He further testifies that, after returning home, he thinks he wrote Mr. Kissinger concerning the terra-cotta pipes, from the fact that he had found a letter from Mr. Kissinger to him, dated shortly afterward, wherein

Mr. Kissinger informed him that he had received his (Draper's) letter, and that he had been told that only iron pipes would do to go up the hill.

Kissinger's letter is as follows (D. S. rej. 169):

"May 30-75.

"Marysvill—

"MR. DRAPER:

"*Dear Sir,*—i received your Letter about the pipse "now they say none will do but iron to go up hil now I "can get some god ole pipe here, now i want you to "com up soon we got the pech tres al trimd and look "nice wot sho you some farmin this year rite sone no "more.

"Yours truly,

"GEO. KISSINGER."

This letter, when found by Draper among his papers in 1884, was shown to Kissinger, and he acknowledged it to be his, stating in the presence of three witnesses that he remembered all about it, and that the old iron pipes referred to in it were intended for the ram (Draper, D. S. rej. 191, X. Q. 86; Fenn, D. S. rej. 217, Q. 10; Church, D. S. rej. 257, Q. 3), though when subsequently called to the stand by the complainants he unblushingly denied making such admission (Kissinger, C. Vol. 3, 2406, Q. 21). The fact that Draper was in Marysville, at Kissinger's, in the spring of 1875, as he alleges, is admitted by Kissinger himself on his recall (C. Vol. 3, 2405, Q. 7, 8, 14), though he remembered nothing about it when first examined. The fact that Draper, on the occasion of that visit, showed Kissinger how to trim the peach-trees, referred to in the letter, is also admitted by Kissinger (C. Vol. 3, 2412, Q. 86), and the fact that Draper's vessel, the "Anna E. Draper," was in process of building when he went to Camden, on his return home in the spring of 1875, to order the decking, and saw the terra-cotta piping, is proven by indisputable record evidence, namely, Draper's account book, which shows that the timbers for said vessel were gotten out early in Nov., 1874 (D. S. rej. 171); the bill of Cresson & Ross, which shows that the iron for the vessel was bought Dec. 10, 1874 (172), and the bill of Brown & Taylor, which shows that the vessel was rigged in July and August, 1875 (173).

These positive corroborations of Mr. Draper show further that he is one whose memory can be relied upon in the matter of dates. His testimony on the subject of the wooden pipes, standing alone, is entitled to great weight, and when the court comes to compare it with that of George W. Kissinger, we think it will not hesitate long in deciding which to believe.

That he did see the logs for the ram-pipes in the spring of 1875, and that he and Kissinger at that time did converse about them and the ram that had been previously ordered, must certainly stand proved as against mere denial of those facts on the part of Kissinger, especially in view of the latter's proven admission of the fact, and of his character for unreliability and untruthfulness already shown.

Mr. Draper does not pretend to testify positively as to when the ram was first actually put in.

His impression when first called to the stand was that it was certainly not put in before 1875, as he knew there was a good deal of delay on Kissinger's part in getting the log pipes bored (D. Vol. 2, 1125, Q. 9).

The testimony of others of defendants' witnesses shows that his first *impression* was pretty nearly right. Subsequently, after complainants' agents had been to see him and had argued the case to him *ex parte* from the record, he wrote Mr. Storrow that he thought the ram was not put in till 1878 (D. S. rej. 253), but when recalled by defendants he said his impression was that it was put in either in 1877 or 1878 (D. S. rej. 183, X. Q. 56).

He was not there when the ram was put in. He don't pretend at any time to have an independent recollection as to just when the ram was put in, and his mere impressions about it not only do not detract from the force and value of his positive testimony on other points, but in fact strengthen such testimony, by showing that, unless fully satisfied he is right, he will not testify positively to anything.

Joseph Gensinger (D. S. reb. 767), another witness produced in behalf of the defendants, testifies that in the year 1875 he was tax-collector for the borough of Marysville, and that he was never tax-collector thereafter; that there were put in his hands for collection that year the school building and borough taxes. He produces the original warrant authorizing him to collect the school tax, and it is dated July 16, 1875 (769). He also produces his school and building duplicate tax book, and the borough duplicate tax book for 1875, which show that Thomas Draper was taxed that year for real estate valued at $6,000; that his school tax was $36, his building tax $36, and his borough tax $24.

He further testifies that he collected the tax that year on the Draper property of George Kissinger, who lived on the property at the time; that he went around to notify everybody who was taxed as soon as the tax duplicates were placed in his hands; that it was in the latter part of July or beginning of August, 1875, that he went to notify Mr. Kissinger; that he found Mr. Kissinger down at the side of the barn next the spring, in the barnyard, boring wooden pipes; that he asked Mr. Kissinger whether he was to look to him or to Mr. Draper for the tax, and that he replied that he was to get it of him (Kissinger); that he then asked Kissinger what he was making, and he replied that he was making pipes, and that they were going to put in a ram to force water up to the house; that he then asked Kissinger what a ram was, and he explained it to him. He further testifies that during his conversation about the taxes and the ram both he and Kissinger sat upon the log which Kissinger was boring when he went there, the log being supported on two trestles.

The character of Mr. Gensinger's errand on the occasion of this visit to Mr. Kissinger's, the fact that he was not well acquainted with Mr. Kissinger at that time (772, X. Q. 37), and the further fact that on that occasion Mr. Kissinger explained to him what a hydraulic ram was—a contrivance which he was then unfamiliar with—are all circumstances calculated to fix that particular visit and the association of the occurrences thereof in his memory.

The borough tax of $24, noted in the tax book produced by witness, and which witness says Kissinger agreed to assume, appears to have afterward been charged by Kissinger against Draper, for in the account for 1875, taken from Draper's diary (D. S. rej., 178), an item of $24 for such tax occurs.

John H. Harper (D. S. reb. 653), in the years 1875 and 1876, lived upon the Fenn farm, which adjoined the Draper farm, in the borough of Marysville. During the first year he lived there he farmed the place for Theophilus Fenn, Sr., and during the second year for Theophilus Fenn, Jr. In the summer of 1875, about August or September, while he was farming the farm for Theophilus Fenn, Sr., he took a breed sow up to Kissinger's to be covered by Kissinger's boar. Mr. Kissinger saw him coming, and opened the gate for him. They turned the sow into the field back of the barn, and sat down and watched her fully an hour and a half, until she was served. While watching her they sat upon some pipe logs that Kissinger was boring. These logs were supported on trestles, and were from 12 to 18 feet in length, five or six inches in diameter, and were of chestnut timber, some of them being bored and some not (654). Kissinger told him at that time that the pipes were intended for use in connection with a ram for running the water to the house from the spring. The pipes were located beside the gate through which he turned the sow into the field (see Complts.' Exhibit Ives Survey. C. Vol. 3, 2450), and he judges the time of the year from the size of the cabbage and tobacco in a truck-patch which he and Mr. Kissinger at that time inspected (654, Q. 15–19). He knows that he bought the sow while he farmed for old Mr. Fenn, and that Kissinger's was the first place he took her after he bought her; that the sow had but two litters, the second one being in the summer of 1876. He swears positively that he never took a breed sow to Kissinger's except on the occasion mentioned, and that when he moved from the Fenn farm, in the spring of 1877, he left her on the place. The last time he was on the Draper farm previous to his removal to Duncannon, Pa., was in the fall of 1877, when he went up there one Sunday, by way of the cemetery, with young Theo. Fenn for some cider and apples. On that occasion, however, he did not see Mr. Kissinger, nor any one else on the place.

He moved from Marysville to Duncannon the last of February, 1878, and his household goods were shipped there by railroad (657 Q. 40, 41). The exact date of his removal is positively fixed by the shipping-books of the R. R. Co. at Marysville, which show that his goods were shipped to Duncannon on the 27th of February, 1878. He was never back on the Draper farm after he removed to Duncannon till long after Kissinger had left the place (656 Q. 36).

The whole of this witness' deposition is very clear, and as he testifies with positiveness, his testimony should be given great weight.

He is corroborated in regard to living on the Fenn farm between April, '75, and April, '78, by Theophilus Fenn, Jr. (see Fenn, D. S. reb. 776, 777.) Fenn also remembers the circumstances about Harper taking the breed sow up to Kissinger's to be served. He says that the sow in question was black, and the only black seed hog in that county was at George Kissinger's; and it was through a desire to raise black hogs that the sow was taken up to the latter's; that he saw Harper start off with the sow, and saw him return with the same; that Harper informed him that the sow had been served; that he knows of his own knowledge she got with pigs after it; that these pigs were appraised to him on the 31st day of March, '76, the date being fixed positively by an entry in his books of the appraisement (779.) His book also shows that those pigs were butchered on the 12th Dec., 1876 (778.) Fenn also says that the farm on which Harper lived was sold early in 1878 to Abner Cassell, and that Cassell took possession April 1st, 1878. Cassell is called (D. S. reb. 797), and produces the deed of the property from Theophilus Fenn, Sr., and wife to him, and it is dated Jany. 9th, 1878.

James Champion (D. S. reb. 594) moved from Dauphin Co., Penna., to Marysville, in March, 1876, this date being fixed by an entry in the freight book of the R. R. Co. at Marysville, showing that his household goods were received in Marysville by the Northern Central R. W. Co. on the 28th of Mar., 1876 (Geib, D. S. reb. 1134, Q. 1.) He first occupied Widow Leah Miller's house; lived there about a year and then moved into John S. Weaver's house. While he lived in Widow Leah Miller's house, James Zimmerman, George W. Kissinger's son-in-law, took dinner with him, and the subject of Mr. Champion's water-supply being brought up, Zimmerman mentioned that Kissinger was going to get a conveyance for carrying the water up the hill to the house. Such conveyance was what the witness called a battering-ram, but Zimmerman called it a hydraulic ram. The same day, after dinner, he accompanied Zimmerman home to the Draper farm, but nothing further was said with reference to the ram. About the 1st of June, 1876, he and his wife went up to Kissinger's house on the Draper farm to get early cherries. They did not get any, but arranged to come and get late ones. In the early part of July, 1876, he made a third visit to Kissinger's, accompanied by his wife and two daughters, for the purpose of picking cherries, and in going from the house to the barn he showed his wife where the spring was that Zimmerman had mentioned. They then passed up the hill and through a gate (see Ives Survey) into a field; and when they had passed the gate they saw some timber lying on the ground, and his wife asked him what it was for, some work having been done upon it. The timber, most of it, was bored through lengthwise, and he told his wife that it was for pipes for conveying the water up the hill.

Witness worked for Leonard Swartz from June, 1877, off and on until the fall of that year, his last work for Swartz being done two days before he was burnt out of John S. Weaver's house (597); *i. e.*, December 1, 1877 (see Weaver policy of insurance, D. S. reb. 592). While he was working for Swartz, and some time after wheat harvest, he went over to Kissinger's to get a plow, taking a path across the peach orchard to the barn (see Ives Survey) to avoid Kissinger's bad dogs. Saw Zimmerman going to the spring for a bucket of water, and the latter told him that the water conveyance or hydraulic ram was out of repair, and it was more bother than it was worth (602 Q. 63). The fifth and last occasion witness was at Kissinger's he got some pumpkins, a portion of which were afterwards destroyed by the fire of December 1, 1877.

Mrs. Sarah J. Champion, wife of James Champion (D. S. reb. 117), produces a rent receipt (608) showing that she lived in Widow Leah Miller's house in May, 1876.

She corroborates her husband in regard to the conversation with Zimmerman about the ram at that house; also in regard to the two visits for cherries at Kissinger's, and in regard to seeing the log pipes at the second visit for cherries; and testifies that she was never at Kissinger's except upon the two occasions mentioned. In regard to the location of the logs, says they were but a short distance from the barn, lying on the ground but not piled up.

Mrs. Mary McFarland (D. S. reb. 728) moved from Dauphin, Penna., to Marysville, in June, 1876, and moved from the latter place to New Market, Cumberland Co., Penna., in April, 1877. Both of the dates are fixed positively by the R. W. books, which show the transfer of her household goods on two occasions mentioned. While residing at Marysville, between the dates mentioned, she went with her husband and sister to pick cherries at Kissinger's, and there met Mr. and Mrs. James Champion and their daughters, the youngest of whom was about eight years old at that time. She saw bored logs lying in the field near the barn, on the right-hand side of the barn, toward the river, and saw Mrs. Champion's little girl playing upon the logs and sticking sticks in the holes in the ends of them. The witness has never resided in Marysville since she moved away from there to New Market, in April, 1877 (729 Q. 9), and has also never been at the Kissingers' place since that time.

John Peffley (D. S. reb. 640) moved to Marysville some time prior to 1874, and he lived there until about the first of July, 1876, when he moved away, and remained until October, 1883, when he moved back to Marysville. He is a shoemaker by trade, and was working for Herman Eppler at the time he left Marysville in 1876, but just previously had had a shoe-shop of his own, which he sold out to Eppler in April, 1876, as shown by an entry in a book kept by him (642). (See also Eppler, C. Vol. 3, 2206, X Q. 247.) While he was living at Marysville, and before he moved away, in July, 1876, he became acquainted with the Kissinger family; was often with the Kissinger boys, and used to go up to the farm to get fruit. In the summer of 1876, before he left Marysville, he saw a ditch between the house and the spring, and also saw wooden pipes lying around at the barn and at the ditch. The ditch ran in a straight line from the house down to the hollow, and then made a bend and ran over to the spring; heard people talking about the pipes, and understood that they were for a ram. The witness was never on the Draper farm after he moved from Marysville, in July, 1876, until he came back to Marysville to live, in the fall of 1883, when he went up there with Squire W. K. Fenn to show him where he saw the ditch and pipes in 1876, and while there with Squire Fenn saw the ram in a hole in the ground at about the spot where he saw the bend in the ditch in 1876.

Josiah M. Bruner (D. S. reb. 614) went to Marysville to live February 27, 1874, and lived there until February 28, 1877, when he moved to Duncannon, Pa., shipping his household goods and effects there by rail. The date of his moving to Duncannon is fixed positively by the railroad books at Marysville (see Geib, D. S. reb. 1134, Q. 2). He was engaged in the butchering business from the time he went to Marysville till May 13, 1876; he produces his butcher book, which shows that his last day's business at Marysville was May 13, 1876. From the time he went out of the butchering business till the fall of 1876 he was engaged in buying and selling live stock; bought and sold sheep mostly, and those he had near Marysville were pastured on the Draper farm, then occupied by Mr. Kissinger. He frequently went to Mr. Kissinger's place to look after his sheep, going past the house to the fields by and beyond the barn. Remembers that at that time there was an open observatory on the top of the house, consisting of a railing about three feet high, and without glass walls or roof (617, Q. 32, 33.) (This railing was taken off the house in September, 1877. Brabson, D. S. reb. 969.) Some time about August, 1876, when the witness was up at Kissinger's to look after his stock, he noticed a hole dug in the hollow below the house; asked Kissinger what he was going to do with the hole he had dug, and Kissinger replied that he was going to put a ram in to force the water up to the house; he then asked Kissinger why he did not put it up near the spring, and he replied that he had put it down where the hole was, in order to give the water fall enough to force it up to the house.

Kissinger then showed him some sticks of timber that he intended to use for the pipes from the spring to the ram (617), and he thinks that one of the sticks of timber was lying on trestles at the time. He doesn't know whether the hole for the ram was complete or not, but knows it was in the hollow, and thinks it must have been about two hundred feet from the spring. Since this witness moved away from Marysville in February, 1877, and testifies that he has never been on the Draper farm since the fall of 1876, it is impossible that he could have seen the bored pipes at the time when complainants contend they were made—*i. e.*, in the winter of 1877-78.

Calvin Keim (D. S. reb. 733) worked for George W. Kissinger on the Draper farm in the fall of 1876, cutting off corn, and at that time saw the hydraulic ram in the hollow between the house and the barn. It was under ground and covered over with boards, and he looked through the cracks of the boards and saw it (735). He also at that time noticed a trench up near the house, and the ground lying up in a ridge by it. He fixes the date by the fact that for the work that he did for Kissinger at that time he was paid in corn in the spring of 1877, and he fed that corn to two pigs which he bought at Solomon Moyer's sale, on the 17th of February, 1877, as appears from an entry made in his memorandum book at the time (736), and butchered the pigs about the time of the holidays of the same year he bought them. He fixes the date of his working for Kissinger by the further circumstance that he entered the employ of the N. C. R. R. Co. on the 18th of August, 1877, has (733) worked steadily for said company ever since, and has never cut off any corn for anybody since that time (733, Q. 8), and has has not, in fact, done any work outside of railroad work since August, 1877 (737, X. Q. 46). He is corroborated by George W. Rhoads, another of defendants' witnesses, who testifies (D. S. reb. 1050) that he worked with him on that corn-cutting job at Kissinger's in fall of 1876.

George W. Hayes (D. S. reb., 850) is a blacksmith. In 1876 and 1877 he was employed as a night watchman at the coal-shutes of the N. C. R. R. Co. at Marysville, and while so employed, some time about May or June, '76, he had a conversation with Mr. George W. Kissinger, in which the latter said he was then boring pipes. In a subsequent conversation with Kissinger, about the middle of the summer of the same year, Mr. Kissinger told him that he was going to fetch the hydraulic ram. All these conversations occurred while he was working at the coal-shutes, and the time that he worked there is positively fixed by the books of the R. R. Co., which show that he commenced work March 17, 1876, and continued to June 30, 1877, when he quit the services of the Co., since which he has not worked for the Co. (see Dickinson, D. S. reb., 837).

William Hess (D. S. reb., 946) has lived in Marysville since 1870, and is an employe of the N. C. R. R. Co. He was out setting rabbit-boxes and snares in the fall of 1876, and on his way home met Josiah M. Bruner and Stiles Fesler, on the road leading to Mr. Kissinger's, and they all three went on Kissinger's place to look after some sheep that Bruner and Fesler had there. They went in by the house and down to the barn (948), and between the house and barn, and close to the run (see Photographs Kissinger's place, Nos. 4, 5, 6), witness saw the ram. It was boxed up in the ground. He asked Bruner and Fesler what it was for, and they told him it was to force water to the house, to save the women from carrying it up from the spring (948). The witness swears he was never down where the ram was after that; was never afterwards at the Kissinger house but once, and that was in the evening.

He has been continuously employed by the R. R. Co. since Sept. 26, 1877, and he says it was about a year before he went to work there that he saw the ram. He must be correct in his dates, as Bruner, who went to Kissinger's with him to look after the sheep pastured there, testifies that he only pastured his sheep at Kissinger's at times between May 13, 1876, and about the first of Nov., 1876, and that at the last-named date he went out of the business (D. S. reb., 616), and moved away from Marysville in Feb. 1877. Fesler, the other party who was with him when he saw the ram, testifies that he only pastured sheep at Kissenger's place from the middle of August, '76, till 5 or 6 months thereafter.

Stiles L. Fesler (D. S. reb., 865) resides in Marysville, and is a butcher. He began butchering on his own account about the middle of August, 1876, and continued five or six months. During that period he pastured sheep on the Draper farm where Kissinger lived, and after that never pastured any sheep there. While he pastured sheep at Kissinger's he sold Kissinger meat, and he produces his books of account, showing charges against Kissinger for meat furnished between Aug., 1876, and October of the same year (866). One day when he went up to the farm to look after his sheep he saw Kissinger in his shirt-sleeves digging with a shovel below the house, and Kissinger told him he was trying to fix the ram that was intended to force water up to the house. Kissinger said it did not work as it was intended to, that the pipes leaked, were not jointed right, or else the water did not have force enough; he did not know what the trouble was. He then left Kissinger, went over to the spring, got a drink, and noticed the pipe in the spring; then went back and told Kissinger he could not understand how they could get the water up to the house. Kissinger told him that the water was to empty into a half-barrel that could be seen standing up near a little dry-house, and if the ram would work it would save the women lots of trouble.

Edward L. Gault (D. S.-reb., 869) is a clerk in a dry-goods store in Marysville. From childhood until 1881 he lived with his father on a farm in Rye township, Perry Co., Pa. The Draper farm, on which George W. Kissinger lived, was between his father's farm and the village of Marysville. In 1876, in warm weather, he was in search of some lost cattle along the south side of Cove Mountain, towards Marysville, and, following along the mountain, came to the Draper farm. He went down to the barn and to a place where he saw "a middling old man, not very tall," at work fixing a ram. He stayed there about half an hour, and assisted the man by holding a wrench, to keep the pipe from turning. The man told him that the ram was full of dirt; and he took out the dirt and put the ram together again, and it worked. The man said the ram should not have been out of repair in so short a time.

The witness also says, that the ground between the ram and the house had been dug up at several places, and at one place, about one hundred feet from the ram, was still open for about three feet. He looked into this opening and saw an old pipe lying in there. The man said that the pipe was an old one, and that it leaked where they had dug up the ground. The witness speaks of seeing two pipes in the ram-pit, a large and a small one, which were evidently the inlet and the outlet pipes.

The weakest kind of an effort was made by complainants to rebut Mr. Gault's testimony by the surveyor, Mr. Ives, who made the survey of the Draper farm for them while they were putting in their closing testimony in June, 1884. He was asked the following question (Ives, C. Vol. 3, 2,454):

"Question 17. You say you particularly noticed the water-ram on the farm, and the pipes connected therewith. Please say whether or not you saw any pipe connected therewith having a cap or nut, and which pipe it would be either necessary or useful to hold by means of a common wrench to prevent it from turning while unscrewing said cap or nut?" He answered as follows:

"A. I saw no pipe which could be grasped by an ordinary wrench in a manner to assist in the operation of unscrewing the mentioned cap or nut."

In the dilapidated condition in which the ram was in 1884, it was quite probable that there was no pipe to be seen having a cap or nut, and at the time mentioned it is doubtful if there were any pipes at all connected with the ram.

Mr. Gault, in his testimony, did not say that either he or the man at work at the ram unscrewed a nut. What he did say was, that he held with one wrench one of the pipes connected with the ram, while the man with another wrench was "unscrewing and taking off the cap—by cap I mean the top where the pipe was connected with the ram" (Gault, D. S.-reb., 861, Ans. 25).

What the man did, probably, was to take off the top, or long vertical part of the ram, and clean it out, for Gault says he took the dirt out by means of a rod or stick (864 and 68).

The man whom he saw working at the ram on that occasion is not further identified than by Gault's description of him, but it is left with the court to determine whether that description does not apply accurately to Mr. Drawbaugh, the person who is alleged, even by complainants' witnesses, to have been the one who put in the ram.

Peter Kaffenberger (D. S. reb. 914) resides in Steelton, Dauphin Co., Pa. In April, 1874, he bought of John Harold and wife a farm in Rye township, Perry Co., Pa. He produces the deed, and it is dated April 1, 1874 (915).

At the time of its purchase he went to live on that property. It was about a mile from the Draper farm. In the fall or winter of 1875 he began to dig a well on his farm, and after he had gotten down five or six feet an old miner came along, a Welshman named Roberts, and looked in the well, and took some of the clay that had been thrown out of it and went away; returned shortly, and asked him for a lease for mining fire-clay; said that he wanted to sink a shaft. Witness gave him a lease, and he took away about three-fourths of a barrel of fire-clay and sent it to Marietta, Pa., to a man named Musser, his partner under the lease. Roberts and Musser stopped him from digging further at the well, as they wanted to use it as a shaft after they had tried the clay.

The finding of the fire-clay in his well caused considerable talk in the community, and a large number of people came up to see it, among others Mr. George W. Kissinger, who came up there one Sunday not long after the fire-clay was discovered. In conversation with Mr. Kissinger on that occasion he was relating to Mr. Kissinger how they had stopped him from digging his well, and that it was too far to carry water from his spring to his house, when Kissinger remarked that the distance from his spring to his house was only about the same as that from his, Kissinger's, spring to his, Kissinger's, house, and that he, Kissinger, was going to lay a pipe and fetch the water from the spring to the house with a ram, and that witness could do the same. Kissinger also told him that he was going to get his ram from Milltown. The lease to Roberts and Musser was for 20 years, but to be forfeited unless they began operations within 9 months. They did nothing after taking away the three-fourths of a barrel of fire-clay, and after the 9 months expired witness started in and finished the well, the job being completed during the winter of 1876. For a while he got water from the well by means of a windlass and rope, but in the spring of 1877, about March, he put in a force-pump. The date of the completion of the well is positively fixed by one of complainants' witnesses, Mr. Christian I. Heisley, who swears (C. Vol. 3, 1797, Ans. 35) that in Oct. or Nov., 1876, he walled up Mr. Kaffenberger's well, and produces his time-book, in which he says he put down his time every day after the work was done, containing the following entry:

1876. Peter Cafenberger,	*Dr.*
Oct. 11.—To one day	$1.25
Nov. 8.—To one day	1.25
9.—To one day	1.25
10.—To $\frac{3}{4}$ of a day	1.00
	$5.00

In the fall of the year 1876 the witness (Mr. Kaffenberger), about the time corn was in shock, went down to Mr. Kissinger's to see how his ram worked, and found Mr. Kissinger working in the front field, near the road. Mr. Kissinger said his ram was then working, and that he (witness) could see it. They together went around behind the house, and there saw the water dropping out from a pipe into a barrel that was standing not far from the house. He told Kissinger that it did not suit him; that it didn't discharge water enough. He did not go down where the ram was, but went off home, *and after that time finished his own well.*

His testimony in regard to the time when Roberts and Musser had the lease is corroborated by an original letter to him from Musser, which is dated Jany. 8, 1876, at Marietta, Lancaster Co., Pa., and is spread upon the record in full at pages 920, 921, D. S. reb.

The details and circumstances related by Kaffenberger seem so striking and peculiar, and the dates which he gives are so positively fixed, that we cannot see how he can possibly be mistaken.

Unsupported, his deposition is entitled to great weight, but taken in connection with the depositions of other witnesses who testify to the existence of the ram in 1876, the fact that the ram was there at that time must be held to be proved.

John Kaffenberger (D. S. reb. 952) resides in Steelton, Dauphin Co., Pa., and is a son of Peter Kaffenberger. He lived with his father, in Rye township, Perry Co., while Mr. George Kissinger lived on the Draper farm. In the year 1876, between harvest and corn-cutting time, he and his brother, William, since dead, were driving down the Valley Road to Marysville with a horse and spring-wagon, and met Mr. Kissinger about half-way between the Draper farm and Marysville coming up in a two-horse farm-wagon. They stopped, and he asked Kissinger what it was he had in his wagon, and Kissinger replied it was a ram for pumping water up to the house.

About October, 1876, witness and his brother went down to Kissinger's place to make some cider, and used his, Kissinger's, cider-mill, which was standing under a large cherry tree at the lower part of the orchard, about two-thirds of the way from the house to the spring. They were attracted by the noise of the ram, and went down to see it, and found it in a hole in the ground, which was laid up with loose stones.

He knows it was in '76, for the same day he went to John Sitterly's to use his cider-mill, and found that Sitterly's mill was out of order and that he had gone to the Centennial Exposition, whereupon they went to Kissinger's as stated.

The complainants have endeavored to destroy the effect of this deposition by recalling Peter Kaffenberger, the witness' father (C. Vol. 3, 2,477), to prove that the particular spring-wagon which the witness said he and his brother were in when they met Mr. Kissinger bringing the ram had been sold previously by Mr. Kaffenberger to Mr. Kissinger, but it is not by any means clear from his testimony that the wagon had been sold to Mr. Kissinger previously.

The most that Mr. Peter Kaffenberger was able to say upon the subject was, that he sold a horse in March, 1876, and, rather indefinitely, that the wagon was sold two or three months after that date; but Mr. Kissinger himself says he didn't buy the wagon till the *fall* of 1876 (C. Vol. 3, 2,411, Q. 70). Although it would have been possible for the witness to have made a mistake about the particular wagon he happened to be driving in, wagons being common things, and his father probably owning two or three of them, it is not at all probable that he would make a mistake about having seen the ram in Kissinger's wagon, and having conversed with Kissinger about it, in view of the fact that the ram was an object not often seen in that community, it being admitted on all sides that Kissinger's ram was the only one that had been put in, in or about the borough of Marysville.

William H. Meals (D. S. reb. 800) testifies that he is a drop-hammer man, and resides at Springfield, Ohio; that he formerly lived in the borough of Marysville with his father, in a house on a corner of the Draper farm, on the top of the hill towards the village of Marysville. His first knowledge of the Kissinger ram was obtained in the year 1875 or 1876, when he heard Mr. Kissinger tell his, witness,' father, since dead, that Mr. Draper had bought a hydraulic ram to throw the water from the spring to the house; that it had become too hard to carry the water up the hill. In the latter part of the summer of 1876 he worked for Mr. Kissinger, and helped to dig the trench between the ram and the house, digging about half-way between the ram and the point where the pipe comes out of the ground near the house. The trench had been previously dug from the point where he worked to the ram, and from the ram to the spring.' This was before he went to work for Mr. Ezra Gilbert at Milltown, and he worked for the latter, according to the latter's books of account, from Aug. 3 to Oct. 7, 1876. (Gilbert, D. S. reb. 727.)

In October, 1876, he again worked for Kissinger, and at that time the trench, which he had helped to dig previously, was covered from the part where he had worked down to the ram, and in the other direction to about half-way up to the house. He thinks it was also covered between the ram and the spring. The ram had been put in at that time, and while he didn't see the ram he saw the water coming out of the spout near the house, and by that judged that the ram was working. About half-way from where he had helped dig to the house he saw the iron pipe running over boxes or trestles. He again worked for Mr. Kissinger in '77, about 3d of May. The ram at that time was covered with corn fodder, and Cyrus Kissinger uncovered it and told him it was broken; that it had been frozen the winter before.

Theophilus Fenn (D. S. reb. 775), testifies that he resides in Philadelphia, and is a salesman for Baxter C. Swan; that he is a son of the late Squire Theo. Fenn, formerly of Marysville, and a brother of the present Squire William K. Fenn, of Marysville. He lived in Marysville from 1874 till January 1st, 1879. During a portion of that time his mother owned a farm in the borough of Marysville, which, from April 1st, '75 to April 1st, '76, was farmed for his mother by John H. Harper and Christian McAllister, it being divided into two distinct parts, one of which Harper farmed, and the other of which McAllister farmed. From April 1st, '76, till April 1st, '77, the witness rented both parts of the farm from his mother, subletting one part to John Leonard and occupying the other part himself in connection with John H. Harper, who worked it for him. From the 1st of April, '77, to April, '78, that farm was rented to J. W. Crossly and John Leonard; and early in '78 it was sold to Abner Cassell (see Deed Cassell, D. S. reb. 799). After witness quit farming, in the spring of 1877, and until he went to live with his father, in the fall of '77, he boarded with John H. Harper, near the upper station at Marysville (784). From the fall of '77, till the 1st of January, '79, when he went away to Philadelphia, he lived with his father.

Either in 1876 or 1877, in the fall of the year, he called at the Draper farm, where George W. Kissinger lived, on business, and Mr. Kissinger directed his attention to the ram and showed it to him. The ram was not working when they went to it, but Mr. Kissinger started it, and it apparently did not work well. Witness saw a pipe that led from the ram towards Kissinger's house, and when the ram was started a very small stream of water, about the size of a goose-quill, would issue from the end of the pipe nearest the house. The end of the said pipe was straight, and was raised up and rested on an old half-barrel or box. Kissinger at that time said the pipes were old and had frozen and bursted; that he would have to get others, and expected the ram would do better service, as the pipe would not then lose its water. Witness at that time also saw the end of a large wooden pipe in the spring, and Kissinger said that it fed the ram. He inquired of Kissinger the cost of putting in a hydraulic ram, with a view of putting in a *ram on his mother's farm.*

He knows positively that this conversation could not have occurred after the year 1877, because the knowledge of the cost of the ram would not have been worth the asking at a later date, his mother's farm having been sold in January, 1878. The witness further testifies that when, about the middle of September, 1878, a commission met at Marysville to look at several proposed cities for a state penitentiary, and a question was raised as to how water could be supplied to the Cassell farm, he suggested, among other things, that water might be carried up from Fishing creek by hydraulic-ram power, his mind at once reverting to the Kissinger ram which he had previously seen. The date of the visit of this penitentiary commission is fixed positively by an entry in the minute book of the commission as being September 27, 1878 (see Hart, D. S. reb. 1,131).

The witness has no recollection of being up to Mr. Kissinger's between the time he quit farming and the time he moved to Philadelphia, except a faint recollection of being there one Sunday with Mr. John H. Harper. He is probably correct as to his visit with Harper, as Harper testifies to being up there one Sunday with him, in the fall of 1877, for the purpose of getting cider and apples (see Harper, D. S. reb. 655, Q. 28).

Oliver H. Miller (D. S. reb. 577) is a resident of Marysville, and was at one time constable. Between the years 1874 and 1880 he kept a team and did hauling of various kinds. From June 18, 1874, until October 1st of the same year, a man named Aaron Ahn was employed by him, and after October, 1874, never worked for him. He produces a book containing entries fixing these dates (579). In that same year, 1874, he farmed a part of a field for Mr. Kissinger, on the Draper farm. One day while his hireling, Ahn, was at the Draper farm working the corn for him, he went up to see how he was getting on; and while he was there Mr. Kissinger came to the field, and they both got on the fence and engaged in conversation; that presently he became dry, and asked Mr. Kissinger if there was a tin at the spring, that he wanted a drink. Kissinger said there was, and said he would go with him. On their way over they met one of the women, whether one of Mr. Kissinger's daughters or his wife he does not remember distinctly, carrying two buckets of water. He said, "Mr. Kissinger, that's too hard work for women; why do you not make Mr. Draper dig you a well?" And Mr. Kissinger replied, "We are going to have something better than that. Mr. Draper promised to have me a battering-ram put in to throw the water up to the house."

The particular value of this witness' testimony is, that it proves that in the first year that Mr. Kissinger lived on the Draper farm the subject of putting in a ram was discussed by Mr. Draper and Mr. Kissinger; and it tends to greatly support Mr. Draper's testimony, to the effect that in the summer or fall of the year 1874, when he was up at Marysville, and after Kissinger's complaint about carrying the water, he and Mr. Kissinger went over to Milltown and ordered the ram of Mr. Drawbaugh.

John H. Rhoads (D. S. reb. 851) testifies that he resides in Rye township, Perry county, Pa., and is a laborer; that between the 1st and 15th of October, 1876, while employed by Seidel Bros. in sledding wood on the Kell tract, he and a man named Leo. Lantz, who was helping him on that job, took a day off for fishing; that they caught some small bait-fish, and on their way to the river stopped at Kissinger's spring to give their little fish some fresh water; that he noticed that the spring had been freshly walled up, and that there was a tin screen in the bottom of the spring; that he said to Lantz, "There is a new arrangement there," and that Lantz told him that what he saw in the spring was the pipe they had laid down to a ram, which forced water up to the house. He also testifies that at that time he saw a line of fresh ground where the pipes had been covered.

The books of Seidel Bros., his employers, show that they settled with Mr. Rhoads for his work on the Kell tract Jan. 6th, 1877, and Mr. J. Harper Seidel, one of the firm, testifies that the job was finished some time during the winter of 1876–7, and before Jan. 6, '77 (Seidel, D. S. reb. 849).

Joseph W. Rhoads (D. S. rej. 156) testifies that he is a laborer; that in 1876, and up to the time of the holidays of that year, he lived at Churchville, Dauphin county, Pa., and produces a rent receipt dated Churchville, October 23d, '76.

He further testifies that while he lived at Churchville he worked in the hammer-mill at Steelton, and produces a time book (158) showing that the last work he did there was on the 24th November, 1876.

He further testifies that between Christmas, '76, and New Year's, '77, he moved to Marysville, where he has since lived; that in October, '76, before he moved to Marysville, he went over to the latter place to visit his relatives, who lived there; that he got off at the upper Marysville station, and from thence went by a road called the "backway" (159) to his brother's John H. Rhoads, who lived about 2¾ miles above Marysville; that in going up to his brother's he crossed the Draper farm and stopped at the spring to get a drink; that he noticed that the spring was walled up, and that a pipe was in it with a screen over it; that when he got up to his brother John's he told him what he had seen in the spring, and said he thought the pipe was to carry water into the barn-yard; that John said it was not for that purpose, but to carry water to the house. The back road to which this witness refers is now closed (163), but its previous existence is testified to by complainants' witnesses, James C. Zimmerman (C. Vol. 1, p. 634, Q. 117), L. Swartz (C. Vol. 3, 2393, X-Q. 27), and by defendants' witness, Peter Kaffenberger (D. S. reb. 925, X Q. 102).

Edward Crist (D. S. reb. 853) testifies that he works on the Pennsylvania railroad, and has lived in Marysville since Dec., 1870; that from May 20, '76, to March 20, '77, he worked for Mr. Theophilus Fenn; these dates being fixed positively by Mr. Fenn's book (Theo. Fenn, D. S. reb. 779, Ans. 27).

In December, 1876, he was sent up to Mr. Kissinger's by Mr. Fenn to get a breed sow served by Kissinger's boar. He did not get her served, because the boar had been altered, and he had to take her to Daniel Sanders' boar. Witness says that when that sow had her litter of pigs from the service at Sanders', Mr. Theo. Fenn had given up the farm, and Mr. W. K. Fenn, into whose hands the sow came, got the litter. He also says that when he took the sow up to Kissinger's he saw water flowing into a barrel back of the house from an iron spout, in a stream about as big as his little finger.

It further appears that in May, '77, he worked four or five days for Kissinger, planting corn, and took his meals at Kissinger's house. At that time the water which they got for drinking purposes and for washing their hands was obtained from the barrel, where the water was discharged from the ram and the ram was working. He never helped Kissinger plant corn but that once.

He again worked for Kissinger in the fall of '77, about two weeks, gathering peaches, and saw the ram there at that time, but it was not working.

John K. Keim (D. S. reb. 893) testifies that he resides in Steelton, Dauphin county, and works for the Penn. Steel Co.; that from April 1, 1877, to April 1, 1878, he lived with his uncle, George W. Crossley, upon the Fenn farm in Marysville, moving both on and off the farm when Mr. Crossley did.

These dates are fixed positively by Theo. Fenn (Theo. Fenn, D. S. reb. 777) and by Abner Cassell, who bought the Fenn farm in '78 (Cassell, D. S. reb. 800, Ans. 4).

While he was living with Mr. Crossley the witness says he helped Kissinger thresh and to put out the seeding, getting breakfast at Mr. Crossley's, and dinner and supper at Mr. Kissinger's. The water which was used by the Kissinger family at that time was brought from the spring in buckets. He heard the men in the barn say that the water had been previously brought up in pipes, and at meals heard the Kissinger woman say that the pipes were "out of fix." At that time he saw a metal pipe that came up from the ground close by the house, which had something like an elbow on it, and high enough so that a tub could be placed under it.

He has never been on the Draper farm since he moved off the Fenn farm with Mr. Crossley, April 1, 1878.

Henry Shaffer (D. S. reb. 872) is car inspector of N. C. and Pa. R. R. Co.'s at Marysville, having occupied that position twenty-four years. In 1877, about harvest time, Mr. George W. Kissinger came to him to borrow a pair of pipe-tongs, saying he wanted to unscrew some pipe that were connected to his ram; that it had rusted so tight he could not unscrew it. He lent him the pipe-tongs, and he returned them in about half a day.

In the summer of 1878 he saw either Kissinger or James Zimmerman, he don't distinctly remember which, loading some pipe at the Marysville station on a two-horse wagon.

Inasmuch as it is the contention of the complainants that James Zimmerman hauled from the Marysville station, some time in September, '78, the first and only iron pipes that were used in connection with Kissinger's ram, the deposition of this witness is valuable in rebutting their theory, by showing that a year before September, '78, Kissinger borrowed tools for unscrewing old rusted pipe that were already connected to his ram.

Henry Gamber (D. S. reb. 739) resides in Marysville, and has lived there since 1869. He was in the butchering business from prior to Feb., '76, to July, '78, when he sold out to Mr. Joseph Gensinger, and never afterward did any butchering. The date of his selling out to Gensinger is fixed at July 9, 1878, by Gensinger's book (Gensinger, D. S. reb. 767).

On Sept. 26, '77 (742), he butchered a calf for Mr. Kissinger alongside the ditch between the ram and the house, and dressed it under an apple-tree, hanging the carcass on the tree (see Photos. Kissinger's Place, Nos. 4, 5, and 6, Ives Survey).

Kissinger kept the meat of that calf; and he (witness) took the skin and gave Kissinger credit for it, making an entry in his account book, which he produces, the entry being dated Sept. 26, 1877 (741).

He never butchered a calf for Kissinger either before or after that time.

At the time he killed the calf, Kissinger showed him the ram and ram-pipes, and said it was a pity the ram did not work. The ram was down in the hollow between the house and the barn, in a kind of wet place; it was in a square hole in the ground, and the hole was planked to prevent the dirt from coming in at the sides. The witness says he saw pipe up near the house, and about two feet of it stuck up out of the ground.

He thinks the pipe was lead pipe, but he was probably deceived by its appearance, as other witnesses prove it to have been iron pipe.

Stephen H. Morley, another witness (D. S. reb. 1120), says that he resides in Marysville, and is employed by the N. C. R. R. Co.; that from 1871 until the spring of '78 he kept store in Marysville, and lived over the store; that he was sold out at sheriff's sale in March, '78, and his brother, Thomas W. Morley, bought his stock of goods; that he did not live in the house but a few days after the sale.

The date of the sale is proven to have been March 12, 1878, by the original bill of sale, produced by Thomas W. Morley in his deposition (D. S. reb. 573). The witness further testifies that in the year 1876 or '77, and while he was keeping store, and living over the store, he and Theo. Fenn, Jr., started from his dwelling house over the store and went up to the Draper farm; that it was Sunday, and he thinks some time in October; that on that occasion he met Kissinger, who showed him the ram, which was then in operation (1121), and that there was talk about how the ram was to be prevented from freezing.

Another important piece of evidence in support of the defendant's theory is found in the testimony of William L. Taylor and Lewis B. Brabson, carpenters, and of George Curtis Strine, tinsmith, and of his helper, George W. Rhoads, all of whom assisted in building the front porch, and in reconstructing the cupola or observatory of the Kissinger house in the year 1877. The time when this work was done is indisputably fixed by record evidence. Taylor (D. S. reb. 1043) produces his book and shows that he worked on the job in Sept. '77. Brabson produces his book which shows he worked 8 days on the same job in Sept., '77 (D. S. reb. 970). Strine produces his day book, which contains an entry in Sept., 1877, for tinning the roof of the porch (D. S. reb. 997), and also produces a bill dated

Aug. '77, for the lumber that was used in the erection of the porch (997); while the Draper-Kissinger account for 1877, produced by Draper (D, S. rej., 178, and which Kissinger admits to be correct (C. Vol. 3, 2413) shows a charge of $103.50 for that particular job of work. Taylor testifies (1044), and also Brabson (970), that while they were at work on that job they breakfasted at home and took their dinner and supper at Mr. Kissinger's; that at that time the ram was in operation; and that while the water for cooking and washing was obtained from the ram, the water for drinking purposes was brought up from the spring by hand (Taylor, 1045); that one day when they sat down to dinner there was no water on the table, and Mr. Kissinger asked where the water was; that Mrs. Kissinger said one of the girls had just gone to the spring to fetch a bucket of water for the table; that Mr. Kissinger seemed to be a little cross because the water was not there when they sat down, and made the remark that the water the ram forced up not fit to drink because so warm (Brabson, 972).

Both Brabson and Taylor testify that they neither of them have taken a meal at Mr. Kissinger's since they worked for him on that job in 1877 (Brabson, 972; Taylor, 1047). Brabson says that while he was at work on the cupola of the house, he quite plainly heard the thumping of the ram while in operation (977).

Strine testifies that Rhoads assisted him in putting the tin-roof on the portico (998), and Rhoads testifies that while he was there assisting Strine on that job he had occasion to get water, and got it from a pipe that came up out of the ground 15 or 20 feet from the upper corner of the back of the house, between the house and the orchard, and that the last work he did at Mr. Kissinger's place was on that portico, in 1877. The porch and observatory or cupola referred to in this testimony are clearly shown in Defendants' Exhibit Photos. Kissinger Place, Nos. 3 and 5. Prior to the reconstruction of the observatory or cupola, the latter consisted merely of a railing several feet high.

Defendants' witness, Kreidler, testifies that when he and Given saw the ram at Kissinger's in 1876 this railing only was on the top of the house (Kreidler, D. S. rej. 133, Q. 31).

Bruner, who also saw the ram there in the fall of '76, testifies to the same effect (D. S. rej. 617, X. Q. 32 and 33).

David Cowens (D. S. reb. 695, Qs. 5 and 6) also refers to the reconstruction of the observatory.

William L. Taylor, besides testifying about the building of the porch and observatory in '77, says (D. S. reb. 1045) that he did other work for Mr. Kissinger in Dec., '75, Jan., '76, and March, '76, as appears from his account book (1043); and that between Dec., '75, and the work on the porch and cupola in '77, he thinks earlier than the last winter before the last-named job, he was up at Mr. Kissinger's place, and saw Kissinger boring log pipes for the ram.

George Curtis Strine, besides testifying about the work on the porch in 1877, says that prior to Nov. 19, 1877, his bill against Kissinger for porch work, remaining unpaid, amounted to about $22; that on that date (November 19, 1877,) Mr. Kissinger came to his shop and paid $3 on account (999), credit for which was given him on his book (997); that Kissinger came to pay that $3 at that time because he had been up to Kissinger's place after money shortly before that, and Kissinger had promised to pay him something in a few days; that on the occasion of his visit to Kissinger's for that money, he found him down at the barn (1000); that in going toward the barn he noticed the ram, particularly when he crossed the run; that he and Kissinger walked from the barn to the house; that he asked Kissinger when the ram was put in; his rlepy was, "It has been in since last fall."

He further testifies Kissinger said the ram was out of order; that the feed-pipes, being made of timber, didn't work well; that they leaked at the connections or had bursted; that either Mr. Draper or Mr. Drawbaugh was to send pipes there in place of those wooden pipes. That Kissinger at that time told him that the pipe leading from the ram towards the house was out of order also; that when it was put in it was second-hand pipe, and the joints didn't fit well; that it leaked at the joints (1001).

He further testifies Kissinger got down beside the ram and started it to work: that it worked "very much crip-" pled like. It worked for a short time, may be a dozen "strokes or so, and then stopped, and then in a short time "it would drive again;" that after a time they walked up towards the house, and from the discharge-pipe a stream about as large as a good-sized rye straw was running.

He further testifies that after the occasion mentioned he heard Kissinger complain in Morley's store, in the village of Marysville, that some pipes he was expecting by rail had not come at the time they should have come (1001). He knows that he saw the ram at the time he was up at Kissinger's dunning him for money a few days previous to the payment of the $3.00, from the fact that that $3.00 was the last money Kissinger paid him until he sued him and collected the balance by a judgment.

He says he brought suit against Mr. Kissinger and Mr. Draper jointly; that he got service on Mr. Draper at Marysville (1010) while he and Mr. Kissinger were coming down the street from the farm, leading two colts that Kissinger had given Mr. Draper in part payment of rent. Complainants' witness, Herman J. Eppler, testifies that the judgment against Draper and Kissinger in favor of Mr. Strine was paid by him, as Draper's agent, on March 6, 1880 (C. Vol. 3, 2265), as appears from his books (Ibid., 2260).

Geo. W. Rhoads, in addition to testifying to the work on porch and observatory at Kissinger's in 1877, testifies that in the year 1876, in the fall, he and Calvin Keim worked for Kissinger, cutting off corn; that he got his dinners at Kissinger's while working there; that the water they got for washing their hands was obtained from a barrel that set under the discharge-pipe (of the ram), near the house; that Kissinger told him at that time the water was forced up by a ram; that he did not go down to see the ram, but heard it in operation (1050).

As to the time he worked for Kissinger, cutting off corn, he is corroborated by Calvin Keim, who says that though he worked for Kissinger cutting off corn in 1876, and at no other time (D. S. reb. 733), he could not recollect who worked with him (738).

He further testifies he saw James Zimmerman, Kissinger's son-in-law, hauling iron pipes with a lumber-wagon and two horses in the year 1878, in regard to which date he is corroborated by a number of witnesses on both sides.

Another very valuable piece of evidence in support of defendants' theory of the ram is found in the testimony of Andrew J. Traver, Abraham C. Dissinger and Thos. W. Morley, three gentlemen of the highest standing in the borough of Marysville, and who, together, in the year 1876 and 1879, constituted a board of assessors, whose duty it was to make the triennial assessment of property, real and personal, within the borough of Marysville.

Dr. Traver is 58 years old; is a physician and surgeon; is the coroner of Perry Co.; was elected assessor in '76 and re-elected in '79 and '82, and has served in the council in the borough of Marysville (D. S. reb. 542).

Mr. Dissinger is 42 years old, has resided in Marysville since 1861 (558), and is a conductor on N. C. R. W. (562).

Mr. Morley is 52 years old, has resided in the section of country including the village of Marysville since 1854, long before the village of Marysville was in existence.

It appears from the depositions of these gentlemen that they were all elected at the regular spring election of 1876 to the offices of assessor and assistant assessors, respectively. Dr. Traver took the oath of office, as appears from the original oath in evidence (542), Nov. 13, 1876. Mr. Morley also took the oath of office the same day, (see orig. oath 568). The exact date when Mr. Dissinger took the oath does not appear.

The commission or mandate, directing the assessors to proceed to discharge their duty in making their first triennial assessment, is offered in evidence (D. S. reb. 544). It is dated Oct. 24, 1876, and is accompanied by printed instructions of the same date, directing how the first triennial assessment was to be made (547). Both papers direct the assessor to complete the assessment and return it to the commissioners' office on or before the 12th day of Dec., 1876, which direction Dr. Traver, the assessor, testifies was complied with (Traver 548).

Great care appears to have been observed in making this triennial assessment of 1876, because of the dissatisfaction that had arisen from the previous assessment. Dr.

Traver testifies on this point as follows: "We took particular pains in our first triennial assessment, from the fact that the previous assessments had been imperfectly made for several terms."

Again, "The previous assessments had given rise to great complaint on the part of the property-holders of our borough" (549).

And to the same effect testifies Mr. Dissinger: "Ques. 15. State briefly the reason why extraordinary care was taken in making the first triennial assessment of yours."

"Ans. For the reason that previous assessment by Mr. Schreiner and his assistants was entirely too high, and so considered by the people."

The mode they pursued was to value the property at what they believed it would bring at a forced sale, getting at such valuation, according to Dr. Traver, "by personal inspection and comparison of properties, taking for our basis what the property of its like was selling for" (549). Or, according to Mr. Dissinger, "we valued property at what we thought it would bring at a quick or forced sale; and each man would carry a slip of paper and mark down what he thought each property was worth, and if we differed we would add them up and divide by 3, and average it in that way" (559).

In carrying out this plan of personal inspection and valuation, these gentlemen testify that they together visited the Draper farm and personally inspected the same, in the fall of '76, between Oct. 24th and Dec. 12th of that year (Traver, 550; Dissinger, 559; Morley, 569).

As to what happened on the Draper farm that day, Dr. Traver testifies as follows: "He and Mr. Morley and Mr. Dissinger found Mr. Geo. W. Kissinger in the barnyard; that while they were there he, Dr. Traver, went to the spring to get a drink (551); that while at the spring the idea came to him that the water could be conveyed from the spring to the house by the use of a hydraulic ram; that when he returned to his companions he made the remark that if he owned that property he would have a hydraulic ram put in.

Mr. Kissinger said they had one in; that Mr. Dissinger then said he would like to see it work. Mr. Kissinger being asked where it was located, pointed down the rawhich date he is corroborated by a number of witnesses on both sides.

Another very valuable piece of evidence in support of defendants' theory of the ram is found in the testimony of Andrew J. Traver, Abraham C. Dissinger and Thos. W. Morley, three gentlemen of the highest standing in the borough of Marysville, and who, together, in the year 1876 and 1879, constituted a board of assessors, whose duty it was to make the triennial assessment of property, real and personal, within the borough of Marysville.

Dr. Traver is 58 years old; is a physician and surgeon; is the coroner of Perry Co.; was elected assessor in '76 and re-elected in '79 and '82, and has served in the council in the borough of Marysville (D. S. reb. 542).

Mr. Dissinger is 42 years old, has resided in Marysville since 1861 (558), and is a conductor on N. C. R. W. (562).

Mr. Morley is 52 years old, has resided in the section of country including the village of Marysville since 1854, long before the village of Marysville was in existence.

It appears from the depositions of these gentlemen that they were all elected at the regular spring election of 1876 to the offices of assessor and assistant assessors, respectively. Dr. Traver took the oath of office, as appears from the original oath in evidence (542), Nov. 13, 1876. Mr. Morley also took the oath of office the same day, (see orig. oath 568). The exact date when Mr. Dissinger took the oath does not appear.

The commission or mandate, directing the assessors to proceed to discharge their duty in making their first triennial assessment, is offered in evidence (D. S. reb. 544). It is dated Oct. 24, 1876, and is accompanied by printed instructions of the same date, directing how the first triennial assessment was to be made (547). Both papers direct the assessor to complete the assessment and return it to the commissioners' office on or before the 12th day of Dec., 1876, which direction Dr. Traver, the assessor, testifies was complied with (Traver 548).

Great care appears to have been observed in making this triennial assessment of 1876, because of the dissatisfaction that had arisen from the previous assessment. Dr.

Traver testifies on this point as follows: "We took particular pains in our first triennial assessment, from the fact that the previous assessments had been imperfectly made for several terms."

Again, "The previous assessments had given rise to great complaint on the part of the property-holders of our borough" (549).

And to the same effect testifies Mr. Dissinger: "Ques. 15. State briefly the reason why extraordinary care was taken in making the first triennial assessment of yours."

"Ans. For the reason that previous assessment by Mr. Schreiner and his assistants was entirely too high, and so considered by the people."

The mode they pursued was to value the property at what they believed it would bring at a forced sale, getting at such valuation, according to Dr. Traver, "by personal inspection and comparison of properties, taking for our basis what the property of its like was selling for" (549). Or, according to Mr. Dissinger, "we valued property at what we thought it would bring at a quick or forced sale; and each man would carry a slip of paper and mark down what he thought each property was worth, and if we differed we would add them up and divide by 3, and average it in that way" (559).

In carrying out this plan of personal inspection and valuation, these gentlemen testify that they together visited the Draper farm and personally inspected the same, in the fall of '76, between Oct. 24th and Dec. 12th of that year (Traver, 550; Dissinger, 559; Morley, 569).

As to what happened on the Draper farm that day, Dr. Traver testifies as follows: "He and Mr. Morley and Mr. Dissinger found Mr. Geo. W. Kissinger in the barnyard; that while they were there he, Dr. Traver, went to the spring to get a drink (551); that while at the spring the idea came to him that the water could be conveyed from the spring to the house by the use of a hydraulic ram; that when he returned to his companions he made the remark that if he owned that property he would have a hydraulic ram put in.

Mr. Kissinger said they had one in; that Mr. Dissinger then said he would like to see it work. Mr. Kissinger being asked where it was located, pointed down the ravine, and said, "*Down there*," pointing towards the place, but saying further that it did not or would not work; that Mr. Dissinger then said he did not care about seeing it.

He further testifies that the place where Kissinger pointed out as the spot where the ram was situated was covered with some rubbish, such as boards, corn fodder, or other material; and that while he has since that day been at the farm-house on professional business, he has never since been beyond the house in the direction of the spring (552).

Mr. Dissinger's account of what occurred there that day is as follows: He and his companions found Mr. Kissinger at the barn, they looked at the cattle, took account of them, and asked some questions in regard to them. Dr. Traver got to talking about the water, and said they ought to get a ram to force the water up to the house; when Mr. Kissinger spoke up and said they did have one, and said it had been working, and had done first-rate, or something to that amount; that he then became inquisitive, a ram being a novelty to him; that he told Kissinger that he would like to see the ram, when the latter replied it was not in working order; after which he lost interest, and thought it was not worth while to go and see it.

He further testifies that a hydraulic ram was so much of a novelty to him that he asked Dr. Traver at that time to explain the science of it to him; and that the Dr. and Mr. Morley explained it to him.

He further testifies that he has not been on the Draper farm since 1876 for any purpose whatever, except that one Sunday he was up in the hollow at the lower end of the farm near the village, about 50 yards over the line, but not in sight of the Kissinger house or barn; and that he and Dr. Traver and Mr. Morley were never together upon the farm except upon the occasion of the assessment in 1876.

Morley, the other assistant assessor, gives the following account of what transpired: He says that he remembers being on the Draper farm that day, in company with Dr. Traver and Mr. Dissinger, making the triennial assessment; that he was never there with those gentlemen at any other time (571); that they found Mr. Kissinger at the barn; that he was working at something about the barn-yard; that they made valuation of his live stock; that the day was rather cold and blustering, and they spent some time in conversation upon the sunny side of the barn, which was toward the house. He is not able to swear positively about any conversation there at that time upon the subject of the ram; thinks the ram was there, however, at that time, but not in working order. He says that the first time he ever saw the discharge-pipe of the ram there was no water flowing from it, and he believes it was upon this occasion.

It will be observed that Morley's recollection of the conversation about the ram is not so distinct as that of Dr. Traver and that of Mr. Dissinger. He swears positively, however, that he was never on the Draper farm together with Dr. Traver and Mr. Dissinger except on the occasion of this assessment in 1876, and it consequently must have been then that the conversation that Mr. Dissinger and Dr. Traver recollect took place.

From the fact that these same gentlemen constituted the Board of Triennial Assessors in 1879 as well as in 1876, it might be suggested that it was in 1879 that the events in regard to which they testify took place, but this position is entirely untenable, and is disproved by the most positive testimony. Dr. Traver (553), Mr. Dissinger (561), and Mr. Morley (569), all testify that they did not either of them go on the Kissinger place in making the assessment in 1879. Dr. Traver (553) and Mr. Dissinger (562) say that in making this assessment of 1879 they alone took part, Mr. Morley not being able to accompany them because he was laid up with rheumatism; that they met Mr. Kissinger on the public road and got his statement (Traver, 553; Dissinger, 561); that they interrogated Mr. Kissinger about his cattle, and that was about all, and it was not necessary to ask him the value of the farm, and they knew there had been no improvements put upon it (Dissinger, 565); that they did not make as close an assessment in 1879 as they did in 1876, but just looked into improvements upon property that they had assessed in 1876; that after Kissinger's statement they went back to the village and reported to Morley what they had done (Dissinger, 562.)

Morley testifies to being laid up with rheumatism when the assessment in 1879 was made, and to Dr. Traver and Mr. Dissinger coming to him at his house and reporting that they had met Mr. Kissinger and didn't think any change in the assessment was necessary.

In further proof that it was in '76 when the conversation between the assessors about Kissinger's ram took place, and about the sickness of Mr. Morley in 1879, we have the evidence of Mr. Morley's wife, Mrs. Mary E. Morley, and of his mother-in-law, Mrs. Sarah Smith. Both of these ladies testify that while Mr. Morley was living in the house on Main street, Marysville, below the railroad, and on the occasion of the first triennial assessment made by Mr. Morley, Mr. Morley came home to dinner one day, and at the dinner-table said that he had been up to Mr. Kissinger's, and spoke of a ram that the latter had for forcing water up to the house, and he said he had not seen it operation, but he knew how it operated, and explained it to them. They also testify that they moved from the house below the railroad to the house where they and Mr. Morley at present live in the spring of 1878 (Sarah Smith, D. rej. 77; Mary E. Morley, D. S. rej. 144, 145), and that the house in which they at present live is the one which was formerly occupied by Stephen H. Morley. The latter is proved to have been sold out March 12, 1878, and to have moved away shortly after the 1st of April, 1878, to make room for his brother, Thomas W. Morley (S. H. Morley, D. reb. 1121).

Mrs. Morley also testifies that at the time of the second triennial assessment in 1879 they were living where they at present live, and that Mr. Morley was sick at that time with rheumatism; that he was only once able to walk as far as a block from the house, and that he didn't go out with Dr. Traver and Mr. Dissinger in making the assessment that year.

Another striking piece of evidence confirmatory of defendants' theory is found in the testimony of the officers and stockholders of the Chestnut Grove Cemetery Association.

It appears from the book containing the minutes of the meetings of this association that at the fifth annual meeting, held at Marysville, June 4, 1877, the subject of putting in a ram at the cemetery was brought up under the head of "new business" in the following language: "The superintendent was instructed to measure the distance from spring at the bridge near the southeast corner of cemetery, also from stream on south at *base of hill* to centre of ground, and make an estimate of the amount of probable cost to have the water conveyed into ground with an *hydraulic ram*, and report at managers' meeting in July" (D. S. reb. 928).

It also appears (927) by the minutes that the members present at this meeting were Messrs. Funk, Brabson, Dice, Swartz and Wise (927).

Defendants call Mr. John S. Funk, and he testifies that he is 63 years old, master-mechanic of the N. C. Rw. shops at Marysville, has lived at Marysville 19 years, was one of the first members of the Chestnut Grove Cemetery Association, and is president of that association now.

He testifies further that he remembers the meeting of the association on June 4, 1877, and the discussion in regard to the hydraulic ram referred to in the minutes of that date (912); that in that discussion the hydraulic ram that Mr. Kissinger had on the Draper farm was referred to; that his recollection is that some time before that meeting Mr. Kissinger had told several of the stockholders that he had a ram, and that he thought it would be a good thing for the cemetery association to also have one to force water up to the cemetery grounds, and that it was by reason of these remarks of Mr. Kissinger's that the subject was brought up at that time before the meeting of the association (912); that the subject of putting in a hydraulic ram was held under consideration by the association for about a month, but they came to the conclusion that it would be tampered with or destroyed by the boys meddling with it, so the subject was dropped.

Mr. Lewis W. Brabson, who, it will be remembered, also testifies in regard to the work upon the observatory and porch job for Mr. Kissinger in the fall of '77, testifies in this connection that he was present at the meeting of the Cemetery Association of June 4, 1877, and was at that time a stockholder and director of said association; that Mr. Wise, another stockholder, suggested that they ought to have a ram to throw the water up into the cemetery; that he thought it would be very handy for the use of the lot-holders in getting water to water flowers on the graves in the summer season, and that he then referred to the ram at Kissinger's; that part of the board objected at first that the ram at Kissinger's did not work well, but it was afterward concluded that the water did not have fall enough, that that was the trouble, and they thought if a ram was put in the cemetery it would work all right, as it had plenty of fall.

He further testifies (976) that when the subject of the ram was first suggested he opposed the project on the ground of expense, and thought they could get along without it; that, however, finally Mr. Wise was instructed to see what the cost of a ram would be, and to report at the next meeting.

He further testifies that prior to the fall of 1876 he went to Mr. Kissinger's house one Sunday, in company with Mr. Wm. Taylor, at Mr. Kissinger's invitation, for the purpose of eating some watermelons; that when they arrived there Mr. Kissinger invited them around to the kitchen, where he had some watermelons gathered in; that he took them into a room beside the kitchen, cut some watermelons, laid them on the table, and told them to help themselves; that he would have to go out, as Mr. Drawbaugh was there looking at the location of the ground with a view of putting a ram in; that Mr. Kissinger when he left them in the basement said he would have to be in a hurry, as Mr. Drawbaugh would have to be sent home (975); that he did not, however, see Mr. Drawbaugh on that occasion.

Mr. Thomas W. Morley, one of the triennial assessors, testifies (571) that he is also a stockholder of the Cemetery Association, and that while he does not know the fact from having attended any of the association's meetings, as he seldom did that, he recollects one of the stockholders telling him that there was a proposition to put a hydraulic ram in the cemetery, and it was about the time that the ram was put in on the Draper farm (591).

Francis Alonzo Givens is another strong witness for defendants (D. S. rej. 116). He testifies that he lives in Volga, Dakota, and is a telegraph operator; that he went to Marysville to live in Dec., 1875, and lived there till

Dec. 3d, 1877, when he went to Phila., thence to Texas, thence to Iowa, and thence to Dakota; that from the time he left Marysville, in Dec., 1877, he was not there again until April, 1882, when he spent a portion of a day there (119); that while he lived in Marysville he was telegraph operator for the Penn. R. R. Co., and boarded with David Geib, the station agent; that while he lived in Marysville, and he thinks in 1876 (118), and some time after harvest (125), he, in company with one George Kreidler, took a walk one Sunday, and in their walk went on the Kissinger place and saw a hydraulic ram there (118); that it was in a hole in the ground; that there was rubbish of one kind and another around it; that the ground was high around the edge of the hole and thence sloped back, and that he judged the ram was in operation, as its valve was working. He also thinks there was some boards put up to keep the hole from caving in.

Testimony of a more convincing character than that of this witness could not be produced. He could not possibly be mistaken in regard to the time when he saw the ram at Kissinger's. He was not within a thousand miles of Marysville either in '78, '79, '80, '81, and up to April, 1882, so it cannot be that he saw the ram in any of those years.

When he came back in April, 1882, he was in Marysville a portion of a day only, and Kissinger had moved away from Marysville two years before. He testifies that he did not go on the Kissinger place then; that he did not see any hydraulic ram; that he did not see or meet George Kreidler; that he hadn't seen Kreidler since he left Marysville in 1877 (120), and that he never was on the Kissinger place but the once. He was brought way in from Dakota at the time he was examined, and before going on the stand did not go to the Kissinger place to refresh his recollection, nor did he have any conversation with Kreidler or anybody else upon the subject, except when preliminarily examined by defendants' counsel.

There are but two things in his deposition which can be made the subjct of criticism. The first is, that he says he thinks the ram was in a south-westerly direction from the house, while as a matter of fact it is in a north-westerly direction. The second is, in describing the location of the ram he says (119, Ans. 26) that it was in a deep ravine that ran down between the "school-house" and the Kissinger house. In fact, no school-house was ever located at that point. But mistakes of this kind rather increase than diminish the value of his testimony, when it is borne in mind that he never was on the farm but once, and then at a period eight years prior to the giving of his testimony.

Nothing is easier than to mistake the points of the compass or to misstate the direction of one unfamiliar object from another, and his taking Kissinger's large barn for a school-house is not at all surprising. There can be no doubt that he meant the barn, for he describes the location exactly. He says that there was a deep ravine between it and the Kissinger house, and that the ram was in this ravine (119 Q. 26). Again, that the Kissinger house was on one side of the ravine and the school-house on the other (126, X. Q. 99). Again, that the Kissinger house could be seen very plainly from the school-house (126 X. Q. 96).

He probably did not mistake the school-house for the barn at the time of the visit, but while recalling the facts to memory eight years afterwards was misled by an indistinct recollection of the size of the building to which he had given no particular attention at the time.

The assessment lists for the borough of Marysville show that Given was rated as a taxable citizen of said borough in the years 1876–77; and that he was not so rated in the years 1878 to 1884 inclusive (D. S. rej. 128); and while the official list of voters who voted in 1877 at Marysville shows that he voted that year, the said list for 1878 shows that he did not vote at that time (D. S. rej. 129; C. Vol. 3, 2487). Kreidler fully corroborates him as to the fact of seeing the ram and as to the time, as we shall next see.

George W. Kreidler (D. S. rej. 129) testifies that he is a resident of Marysville, and is a tinsmith; that he went to Marysville to live Aug. 22, 1876, and has lived there continuously ever since.

One Sunday morning, between Aug. and Nov., 1876, he and Mr. Francis Alonzo Given took a pleasure walk;

they did not know where they were going, but drifted out back of Chestnut Grove Cemetery, and on the road leading over the mountain until they were opposite Mr. Kissinger's. Desiring a drink of water, they went down to Mr. Kissinger's spring and got it, and in going from the spring towards Marysville noticed the hydraulic ram. The witness describes the ram as being between 200 and 300 feet north of the house, between it and the barn, and close to the fence. It consisted of an upright pipe 2 or 3 inches in diameter, having connections at the bottom for inlet and outlet. It was in a hole in the ground, and loose stones were thrown around the hole. He cannot say positively whether it was working or not.

Witness was married April 19, 1877, and from the fact that he remembers talking to Given on that occasion about the cost of boarding and getting their washing done, he knows that it was before he was married; first, because he would hardly get his washing done outside after he was married (132); and, secondly, because after his marriage he kept more at home and seldom met Mr. Given. Inasmuch as Given (D. S. rej. 124, X. Q. 80) remembers Kreidler as being a single man, it strengthens the testimony of each of them that it was in 1876 that they saw the ram, and that of Kreidler that it was before his marriage.

Mr. Kreidler further testifies that he is certain that his visit with Given to Kissinger's was not as early as July, as he didn't go to Marysville to live till Aug. 22, '76, and it was after that (130, Q. 1; 143, X. Q. 120). While it appears that Mr. Kreidler has been on the Kissinger place several times since 1876, he swears that the first knowledge he ever obtained of Kissinger's ram was when he was there with Given in the fall of '76.

From this deposition, it will be seen that Given is corroborated in all essential particulars.

Samuel F. Trafford, another witness for defendants (D. S. rej. 72), resides at Jonestown, Lebanon Co., Pa.; and from 1872 to Oct. 26, 1878, worked for Seidel Bros. at their forge at Marysville, Pa., when he went to work for the South Mountain Iron Co., about 36 miles from Marysville, exchanging places with his brother, Thomas Trafford.

The books of Seidel Bros. prove that his last work for them was done Oct. 26, 1878 (J. Harper Seidel, D. S. rej. 68, Q. 8); and the books of the South Mountain Iron Co. show that his first work for that company was about three days in Oct., '78 (Calvin S. Edwards, D. S. reb. 70, 71).

He continued working for the South Mountain Iron Co. till some time in 1880, when he went to Port Oran, New Jersey, going thence to his home at Jonestown, where he has remained since.

While he was employed at Seidel Bros. he frequently went up to the Draper farm, where Kissinger lived, sometimes gunning, and sometimes for fruit, and saw Kissinger's hydraulic ram 10, 15 and perhaps 25 times.

He describes the ram as being in a dilapidated condition, with a kind of box around it.

He is positive that he saw the ram there in 1877, and his belief is that he also saw it there in 1876, but is not so positive about that. Shortly before this witness was examined, he went again on the Draper farm, the first time he had been there since he quit working for Seidel Bros.,in Oct., '77. He swears that the ram at this last visit stood just where it did in 1877, but instead of being boxed in as it was then, was walled in.

Amos L. Clendennin (D. S. reb. 634) testifies that he is a railroad conductor; that he resides at York, Pa., that he was married to Mollie R. Collier, of Marysville, on the 18th of Feb., 1879, and that up to the time of his marriage resided in Marysville (637); that his wife's father's name was Nathan Collier, and died in the fall of '78 at Marysville; that he paid attention to Miss Collier about four years before he married her, with an interruption between the spring of '78 and the fall of the same year, caused by some little misunderstanding between them.

During this period of interruption in his attention to Miss Collier, the witness courted Miss Susan Kissinger, who was living with her father, Geo. W. Kissinger, on the Draper farm. In the summer of 1878, upon returning home one clear, warm evening with Miss Kissinger from a colored camp-meeting held in Fenn's woods (637), Miss Kissinger requested him to go with her to the spring for a drink of fresh water; they went to the spring, and when in the act of leaving he heard a noise and asked what it was, and she said it was made by a hydraulic ram, put in to force water up to the house. The noise he heard he describes as a thumping sound, that came at intervals.

He visited Miss Kissinger at her father's house between five and eight times between the latter part of June, '78, and the last of Aug., '78 (638), and never has been at the Kissinger house nor on the Draper farm since said last mentioned date.

Enough evidence has, we think, now been pointed out to convince the court of the utter unsoundness of the complainants' theory in regard to the Kissinger ram, and, on the other hand, of the perfect harmony and consistency of the defendants' theory. We have shown by the testimony of Mr. Thos. Draper that the ram was ordered in the fall of 1874; by the testimony of the same gentleman, that the timber for the wooden piping was cut, preparatory to boring, in April, '75; by the letter of complainants' witness, Geo. W. Kissinger, dated May 30, '75, and by the admission of Kissinger respecting that letter, as testified to by Mr. Draper, Mr. W. K. Fenn and Mr. Melville Church, that as early as the date of that letter Mr. Kissinger was looking around for iron pipes for the ram; by the testimony of Mr. James Champion, Mrs. Sarah Champion, Mrs. Mary McFarland, Mr. J. M. Bruner, Mr. John Peffley, Mr. John H. Harper, Mr. Stiles L. Fesler, Mr. Joseph Gensinger, Mr. Theophilus Fenn, Mr. George W. Hayes, Mr. John H. Rhoads, Mr. Joseph W. Rhoads, and Mr. W. L. Taylor, that wooden pipes for the ram were bored during the years '75 and '76; by the testimony of W. H. Meals, that the ditches for the pipes were dug during and prior to the summer of 1876; by the testimony of Brabson, that Mr. Drawbaugh was at Kissinger's in the latter part of the summer of 1876, looking over the ground preparatory to putting the ram in; by the testimony of John Kaffenberger, that the ram was brought over from Drawbaugh's by Mr. Kissinger, between harvest and corn-cutting time in the year 1876; by the testimony of Dr. Traver, Dissinger, G. W. Rhoads, James Champion, Mrs. Champion, Peffley, Fesler, Peter Kaffenberger, Meals, Geo. W. Hayes, John H. Rhoads, Edward Crist, Brabson, G. W. Rhoads, Mrs. Sarah Smith, Mrs. Mary Morley and Joseph W. Rhoads, that it was well known in 1876 that Kissinger had a ram; by the testimony of Henry Shaffer, John S. Funk, W. L. Taylor and G. W. Rhoads, that it was also well known in 1877 that Kissinger had a ram; by the testimony of Edward L. Gault, Stiles Fesler, Wm. Hess, Peter Kaffenberger, John Kaffenberger, Calvin Ceim, Edward Crist, Samuel Trafford, F. A. Given and G. A. Kreidler, that they personally and at different times *saw* the ram in at Kissinger's, in the year 1876; by the testimony of Henry Gamber, Theo. Fenn, Edward Krist, G. C. Strine, S. H. Morley and Samuel Trafford, that they personally *saw* the ram at Kissinger's at different times in the year 1877; and by the testimony of Amos L. Clendennin, that the ram was in, and in operation, in 1878, and prior to the last of August of that year.

All of these witnesses are persons of unimpeachable character, brought from different parts of the country, and having no interest whatever in the result of the controversy, and it is to the last degree improbable—nay, in the nature of things, impossible—that all or any considerable number of them are mistaken as to the facts, dates and circumstances in regard to which they testify. The full force of their testimony cannot be gathered from the mere reference to it here given, and it is hoped that the court will have time to read each deposition from beginning to end, in order that its full force and strength may be appreciated.

Besides this overwhelming mass of oral testimony, there is record evidence tending most strongly to confirm defendants' theory that the ram was put in in the year 1876.

It appears that for the years 1874, 1875, 1876 and 1877, and up to the 1st of April, 1878, Mr. Kissinger paid, or rather contracted to pay, Mr. Draper a money-rent of $200 a year; while from the 1st of April, 1878, till the 1st of April, 1880, he paid as rent a share of the produce raised on the farm (Draper, D. S. rej. 181).

The accounts between Mr. Draper and Mr. Kissinger for the years 1874 to 1878 were kept by the former in his pocket-diary, and are spread upon record at pages 177 and 178 D. S. rej.

The account for the year beginning April 1, 1876, and ending April 1, 1877 (D. S. rej. 184, X. Q. 60), is as follows:

Apl., '76.			
125 bus. lime	$15.62	Rent	$200.00
250 bus. "	31.25		54.18
Nob and key	.31		———
	———		$145.82
Expenses of ram	$60.00	Tax pd. Simon Kreiser...	24.00
Cash	7.00		———
	———		$121.82
	$114.18		

Here we have the charge against Mr. Draper for the expenses of putting in the ram set down in the account for 1876, *just where it belongs, according to the defendants' theory*. The genuineness of the entry is not questioned. It was not put there for the purposes of this case, but for reasons perfectly satisfactory to Mr. Draper and Mr. Kissinger at the time it was done. This both Mr. Draper (Draper, D. S. rej. 185, X Q. 67) and Mr. Kissinger (C. Vol. 3, 2414, Q. 97), and even complainants' counsel (D. S. rej. 202) admit.

When was it put there? Mr. Draper is not sure whether it was put there when he was in Marysville in 1877 or when he was there in 1878 (D. S. rej. 181, Q. 48), but he inclines to the opinion that it was entered when he was there in November, 1878, and made the settlement with Mr. Kissinger (Ibid., Q. 49). Mr. Kissinger thinks it was done in 1878 (C. Vol. 3, 2413, Q. 93).

It is very evident from an inspection of the book itself. that the entry originally stood as follows:

Apl., '76.			
125 bus. lime	$15.62	Rent	$200.00
250 bus. "	31.25		
Nob and key	.31		
	———		

Then the $7 entry was evidently made on the left side of the account, and both sides of the account were added up, and one footing substracted from the other, thus:

Apl., '76.			
125 bus. lime	$15.62	Rent	$200.00
250 bus. "	31.25		54.18
Nob and key	.31		
			$145.82
Cash	$7.		
	$54.18		

Afterwards the footing, $54.18, of the left-hand side of the account was rubbed out; the item "Expenses of Ram, $60.00," entered on that side of the column and again footed up, while on the other side of the account the item "Tax pd. Simon Kreiser, $24.00," was entered and deducted from the previous footing of that side, leaving the account just as it now stands.

Now what is Mr. Draper's explanation?

He says the items of the account were presented to him by Mr. Kissinger in the form of bills, and that he entered them in his diary as they were presented (D. S. rej. 181, Q. 48); that Mr. Kissinger did not bring in all his accounts at once, but would bring in first one of them and then another, and his recollection is that after the account in the diary was first made out, Mr. Kissinger came in and said he had forgotten about the cash item of $7, the item of $60 for the expenses of the ram, and the tax item of $24; and that all these items were then put down. No payment of money was made by Mr. Kissinger at the time, and so the matter was left (Draper D. S. rej. 185, X Q. 64). There cannot be the slightest doubt but that the charge for the ram was placed on the 1876 account because it belonged there. In the absence of any satisfactory explanation to the contrary, the fact of its being there conclusively proves that it was meant to be there, but not a shadow of doubt is left in the mind that it was intentionally and rightly placed there when we come to consider the character of the other items that were in like manner added to the account after it had first been drawn up, namely: the cash item of $7 and the tax item of $24. The first of these we recognize as the credit for the seven dollars which Mr. Kissinger paid Mr. Draper Feb. 22, 1877, as testified to by both Draper and Kissinger (Draper, D. S. rej. 175, Q. 41). (Kissinger, C. Vol. 3, 2421, X Q. 158; ibid. 2423.)

But why was not this item put into the 1877 account?

Simply because the 1876 account extended from Apl. 1, 1876, to Apl. 1, 1877, and this payment happening in Feb., 1877, fell within the 1876 account (D. S. rej. 184, X Q. 60). It was entered there because it was properly an item of that year's account, and belonged there.

Then as to the tax item: The original tax receipt is put in evidence, and is dated Dec. 18, 1877 (D. S. rej. 187). Why also should this not go into the 1877 account? The reason is plain. The explanation is found on the face of the receipt. It purports to be payment in full for the county tax *for the year* 1876! It is not included in the account for 1877 because it does not belong there, no more than the cash item for $7 and the ram item for $60 belong there.

There is no escape from such evidence as this. It speaks volumes. Though it were rebutted by a dozen witnesses it would still have great force, and could not be easily explained away.

The complainants early saw this, but realized they must make an attempt of some kind. As usual, when in a tight place, they called upon Kissinger, and this is the way he did it. That any weight may not be lost we quote what he says (C. Vol. 3, 2413):

"Q. 93. There is an entry in this account book, 'Ex-
"penses of ram, 60'; do you remember whether he made
"that entry at Marysville in the fall of 1878, or whether
"it had been made before?

"A. If I am right, it was made in the fall of 1878.

"Q. 94. When you and he settled at that time, do
"you remember how much was found due from you to
"him for balance of the last year's rent?

"A. Yes, sir, or very near it.

"Q. 95. About how much?

"A. Fifty some dollars.

"Q. 96. In this book the sixty dollars for the ram does
"not now appear deducted from the balance of that last
"year's rent, but was written into the previous year; do
"you remember why that was done?

"A. *I suppose because he couldn't take sixty dollars off*
"*of fifty odd dollars, and it was set back on that account.*"

We venture to say a more imbecile effort to explain away a damaging piece of evidence was never made than this. In the first place, there is not a word of truth in Mr. Kissinger's statement that the balance due from him to Mr. Draper for the year 1877 was only "fifty some dollars." Mr. Draper's book shows that balance to have been $155.41. But suppose the balance had been only "fifty some dollars," there was no necessity nor propriety in getting the ram charge back into the wrong year by reason of that merely; for while it is undoubtedly true, as Kissinger says, that "he couldn't take sixty dollars off of fifty odd dollars," it is equally true that fifty odd dollars might, by a very simple process, have been taken from sixty dollars and the balance noted, without violating the account of another year. This, however, doesn't seem to have occurred to the active mind of Mr. Kissinger.

But what business did a charge for a ram have even in an account for 1877, if the complainants' theory is correct? They contend that the ram was not procured till November, 1878. If that was so, it could not be charged into the 1877 account, because that ended April 1, 1878.

The whole fabric of the attempted explanation thus goes under, and leaves the important testimony of the book only the stronger.

In addition to all the foregoing evidence offered by defendants in support of their theory, there yet remains to be considered the testimony of a number of other witnesses, who were first called by defendants, but who, subsequently, after being worked upon by the agents of complainants in the most disgraceful manner, were recalled by the complainants for the purpose of getting them to retract or modify their previous testimony.

While we believe that the whole testimony of these recalled witnesses, notwithstanding the strenuous efforts of complainants' agents to persuade them out of their memories and recollections, still strongly supports defendants' theory, we have thought best in this brief to separately treat them.

The first of them to be considered are those who gave testimony for defendants in regard to the borrowing of the auger by Kissinger for use in boring his log pipes, namely, Emanuel Keller, Peter J. Heisley, Christian I. Heisley, Joseph S. Heisley.

Kissinger and his son Cyrus, in their original depositions, both referred to the fact that the auger which they used in boring their pipes was borrowed of Emanuel Keller.

Keller was called by defendants (D. S. reb. 619), and testified that Kissinger came to him, he could not say when, and asked him to lend his auger. He told Kissinger he might have it, but that it was at Peter Heisley's; that subsequently he, Keller, got the auger from Heisley's and gave it to Kissinger.

He further testifies that the Heisleys had the auger twice, and it was after the second time they had it that Kissinger borrowed it.

The witness's statement in regard to these facts is corroborated by his son, David A. Keller (D. S. reb. 620.)

When recalled by complainants, Keller testified, in substance (C. Vol. 3, 2382), that he thought, though was not positive, that Kissinger borrowed the auger of him in the fall of '77, and his reason for thinking so was because complainants' agent, Brooks, and Mr. Kissinger and Squire Foulk's son-in-law, Wallace, had, shortly before his examination, told him so.

To corroborate the Kellers the defendants called Peter J., Christian I., and Joseph F. Heisley.

All three of these persons testified that log pipes, for carrying water from the spring to the spring-house, were bored on their father's farm in Rye township on two separate occasions—once when the pipes were first put in, and once when some new sections were made to replace a number of old ones that leaked and had become worthless. Peter said the first boring was in 1874, and that the auger used was obtained from Mr. Dice (D. S. reb. 627, Q. 13). All three testified that the auger used at the second boring was obtained from Mr. Keller, and Peter said that he personally went to Keller's for it; and that it was given him by Mrs. Keller, after some difficulty expeienced in finding the bit (678, Q. 25).

Peter said the second boring took place in the spring of '75; that he was sure of the date, because it was the spring after the pipes were first put in (629, Q. 23).

Christian said he knew the second boring was in the spring of '75, from the fact that when he came home, in September, '74, complaint was made that the pipes did not carry the water properly, and they tried to fix them by pitching them: but that not answering, in the following spring new pipes were bored and put in (667, Q. 47).

Joseph also testified to the efforts to repair the old pipes with pitch and tow before the second pipes were bored (681, Q. 26), and said that both borings took place beween the beginning of '74 and the beginning of '76. Peter and Joseph both testified that the auger was kept but a short time on the occasion of the second boring while Christian was more definite, and said that they had the auger at that time but two weeks (667, Q. 49).

Both Christian and Joseph testified, positively, that while they had the auger the second time, Mr. Kissinger came to them and wanted to borrow the auger to bore some pipes for himself. Joseph testified that he told him the auger was Keller's, and directed him to one of the family (682, Q. 36), while Christian said that Kissinger came to him, and he told him they were through with the auger, but that it belonged to Mr. Keller, and that the latter's permission would have to be obtained before he, Kissinger, could take it (667, Q. 49).

All these Heisley boys were subsequently recalled by complainants, and said they believed they had made a mistake in stating in their former testimony that the second boring of their pipes was in 1875; that while it was their recollection and belief, when they first gave their testimony, that such second boring was in '75, the finding of a reamer, which was used in reaming the pipes at the second boring, and which the books of the blacksmith, W. C. Patterson, who made it, showed to have been made in the spring of '76, had influenced them to believe that the second boring was in 1876.

Patterson was then called to the stand, the reamer was produced, and also the book containing the alleged charge for making it. The entry is as follows (C. Vol. 3, 1748):

P. Heisley, 1876.

Mc 22, fixing boring machine........	.35
Making bit........................	.10

It is quite possible that Mr. Patterson did, at some period of time, make a reamer for old Philip Heisley. The testimony of Peter, Christian and Joseph Heisley, on their recall, of their mother, Margaret Heisley, and of their brothers, Charles, William and Philip, would seem to establish this; but as to the precise date when that reamer was made dependence has to be placed solely upon Patterson and the entry in his book, inasmuch as old Philip Heisley, against whom the charge for the reamer was made, and who, Patterson testifies, personally brought him the reamer job, is dead, and unable to offer any contradictory evidence.

The book itself appears to have been kept in a very slovenly manner, successive accounts appearing to be dated 1872, 1874, 1872 again, and so on, in irregular order.

Moreover, the book is very much mutilated, a large number of leaves having been torn out, and the stubs remaining bearing evidence of writing upon them. In one instance, between two remaining pages dated 1875, a number of leaves have been torn out. In fact, the whole appearance of the book is suspicious. It is especially significant that pages evidently bearing 1875 accounts should be missing, in view of the fact that Patterson seems to have at some time made a reamer for old Mr. Heisley, and the entry of 1876, above quoted, relied upon to show the making of the reamer in that year, does not contain a charge for making a *reamer* at all, but a charge for making a *bit*—quite a different thing. Defendants' theory about this entry is that at some time in '76 old Mr. Heisley got Patterson to made a bit for an ordinary boring-brace, such as most every farmer has, and this view is strengthened from two circumstances: first, from the fact that the accompanying charge is 35 cents for fixing a boring-machine, which would describe quite accurately such an implement; and, secondly, from the exceedingly small amount charged for making the bit, viz: ten cents. The reamer put in evidence is scarcely a thing that could be made for ten cents.

Patterson's testimony in regard to how it was made is substantially as follows: He says that old Mr. Heisley brought to his forge a piece of saw-blade about six inches long, having a number of teeth upon it; that he (Patterson) heated this piece of saw-blade to a red heat, and then, after first scratching off the shape he desired to cut it into, dotted it with a center punch, then reheated it and cut it off with a chisel and sledge, following the marks previously made. Two sides, and perhaps one end of the piece of steel, were thus cut off. The edges were then sharpened by hammering on the anvil and afterwards by filing, while held in a vise; the blade was bent, the iron shank was made; the blade and shank were punched; the holes in the blade were counter-sunk; the rivets made and inserted and headed-up on the anvil with a riveting hammer, after which the shank was heated again and inserted in the wooden handle. All this work, which must have taken considerable time and labor, for ten cents! A charge so small for such a piece of work seems incredible.

It may be that it was when the Heisleys *first* bored the logs that Patterson made the reamer. The evidence shows that when the logs were first put in they were reamed out by P. H. Heisley (C. Vol. 3, 1866), and Patterson does not undertake to testify positively that he never did any work on any bit or boring-machine for Mr. Heisley prior to March 22, 1876, the date of the entry in controversy, but he don't remember to have done so.

But let it be assumed for the purposes of argument that the three Heisley boys were wrong in their original testimony when they stated that they bored their second pipes in 1875, and that as a matter of fact the second boring took place in 1876, and that the reamer was made and used at that second boring; can any advantage result to the complainants, and is not the defendants' theory still supported? Christian Heisley and Joseph Heisley, as we have seen, testified positively in their original depositions that while they had the auger the second time Kissinger came to them to borrow it, and they told him it was Keller's, and that the latter must be seen about it. According to this, Kissinger was trying to borrow an auger in '76, nearly two years before the complainants contend any boring was done by him, and at least 18 months before they contend Kissinger's ram was ordered and there was any occasion for his inquiry for an auger. In his second deposition, to be sure, complainants got Christian Heisley to say that he was not certain about Kissinger's inquiring for the auger while it was there at his place the second time (C. Vol. 3, 1794, Q. 14), but he nevertheless admits that Kissinger did, at some time, inquire for the augur. His brother Joseph, in his second deposition, makes no variation from his original testimony in this respect, and it stands by him proved, aided by Christian's clear recollection of the fact, but not of the exact time that Kissinger did, as early as 1876, make inquiry of them for the auger.

That he made such an inquiry in 1876 does not overcome the positive testimony of defendants' witnesses that he was boring in 1875; and, indeed, from the fact that it appears from complainants' testimony that Kissinger himself borrowed Keller's auger on one occasion, and that Cyrus Kissinger borrowed it on another occasion (C. Vol. 1, 573, X. Q. 215), it is consistent with defendants' theory to suppose that Cyrus borrowed it first in 1875, and that afterwards, in 1876, Kissinger himself borrowed it.

David Cowen is another recalled witness. He testified in the first place for defendants (D. S. reb. 695), that he resided in the borough of Marysville, on a farm next but one to the Draper farm; that he had lived there forty-one years; that in the years 1875 and 1876, Mr. Leonard Swartz farmed his farm; that in the spring of 1875, while Swartz farmed for him, he concluded to put in wooden pipes to convey water from his spring to his milk-house; that hearing that Kissinger was at that time having some pipes bored on his place, he went down to Kissinger's to see them; that he found that Kissinger had drawn together some logs out of the woods, and was boring them with a pipe auger, which he said he had gotten from Mr. Keller, and which he said witness could get to bore his pipes with; that he, witness, went back home, and finding no proper timber on his own land to bore for piping, concluded to make pipes out of boards; that he procured material for his board pipes and made them; that he got a man named Webb to dig the ditch, and that he put the pipes in, all in the spring of '75. He testified further that it was in the fore part of March, 1875, before he put in his own pipes, that he saw Kissinger boring logs, and he produced a book containing an account of Webb's work on the ditching, showing such work to have been done in May, 1875 (ibid., 699).

He further said that at the time he put in his own pipes Leonard Swartz was plowing for corn in the field through which the pipe ran, and that Swartz opened the ditch for him with the plow; and that David Webb completed the ditch (697, Q. 19). Swartz corroborates him in this (Ibid. 684); and so also does David Webb (Ibid. 711).

He further testified that in the spring of 1876 he and Kissinger went down to Milltown to see Drawbaugh about putting in the ram; that Kissinger told him Drawbaugh had promised to come up and put the ram in, but he hadn't come, and he wanted to go down and see when he would come (Ibid. 702); that when they got to Drawbaugh's shop, the latter said he would try to bring the ram up as soon as he could; that he was busy, and had some little fixing to do to it yet (Ibid. 702); that he formed the opinion at the time that Drawbaugh didn't care much whether he furnished the ram or not, as he was afraid he would not get paid for it, Kissinger being so slow in paying (Ibid. 702).

He further testified that he knew this visit to Drawbaugh's shop was in 1876, because Drawbaugh at that time showed them both his talking machine and his large electric clock, and said he was going to get the latter ready to take down to the Centennial Exposition in the fall (704); further, that he never was at Drawbaugh's shop except on the occasion of his visit to it with Kissinger (Ibid, 701). He said that the first time he saw the ram in at Kissinger's, working, he thought was in the fall of 1876, though he was not certain about it (704).

Between the time of giving this testimony and the time of his recall by complainants, the agents of the latter had gone to witness and so worked upon him by arguments and misrepresentations of the testimony of other witnesses examined on behalf of complainants as to actually lead him to doubt whether it was at the time when he first put in his own pipe or at the time when he opened those pipes to clean them out, that he saw Kissinger boring pipes.

After getting him in this frame of mind they put him on the stand, and he testified that after he put in his board pipes in 1875, *and he supposed* a couple of years after, roots grew into them and choked them so as to prevent the free flow of water (C. Vol. 3, 2149), and that he opened up the pipes and took out the roots; and that he thought it must have been that the idea of putting in log pipes occurred to him at that time, and that it was then that he went to see Kissinger and found him boring pipes. But his cross-examination shows that the idea of associating the taking out of the roots from his pipes with the boring of the pipes by Kissinger was suggested to him bodily by complainants' agents, and was not the result of his own reflections and recollection at all (Ibid., 2157, X. Q. 89), and the fact that he was right in his first testimony was conspicuously developed by questions bearing upon the time of the year when he opened his pipes, and the time of the year when he saw Kissinger boring.

He was asked when it was that he opened his pipes to take out the roots, and he stated that it was *soon after harvest, after the wheat was cut* (2167, X. Q. 187; 2168, X. Q. 190), and he was also asked what time of year it was when he saw Kissinger boring pipes, and he replied that *it was early in the spring* (2167, X. Q. 188), giving the same answer that he had given in reply to a similar question in his first deposition when called by defendants (D. S. reb. 697, Q. 16; Ibid, 705, X. Q. 70.)

It was evident from these answers on recall that his unbiased recollection was that the cleaning of his pipes and the boring of Kissinger's pipes were in no way associated with one another, and took place on two separate and entirely different occasions, and when this was brought to his attention, his eyes were opened to the fact, and he admitted it (C. Vol. 3, 2168, X. Q. 191.)

On his recall, the complainants also got him to say that he thought the first time he saw Kissinger's ram Wagner was stoning up the pit.

In his first deposition for defendants he did not undertake to say positively when it was he first saw Kissinger's ram in operation, nor did he attempt to positively fix the time, and it may be that Wagner was stoning up the pit when he first saw it, though it is more than likely that the idea of Wagner's being there was also put into his head by complainants' agents, who seemed to have scrupled at nothing, since it appears they had the assurance to tell him that Wagner had testified that Kissinger's ram was put in in 1878 (2154, X. Q. 57; 2156, X. Q. 54), when in point of fact Wagner had testified to no such thing, but only that he had put a wall around the ram in 1878, and that the ram was in and in operation at the time he did it (Wagner, C. Vol. 2, 1259, X. Q. 27.)

It is confidently believed that the careful reading of both of Mr. Cowen's depositions will convince the court that when he gave the first one he testified according to his own independent recollection and belief, and that the uncertainty found in his second deposition is merely the result of the subtle arguments of complainants' agents, made with a view to mislead and deceive him. It will be noticed that no attempt is made to explain away the witness' visit with Kissinger to Drawbaugh's shop for the purpose of hurrying up the latter about the ram. That visit was so indelibly fixed in the witness' mind as being before the Centennial Exposition that he could not be persuaded that he was wrong in regard to it. The fact that he did make such a visit to Milltown is admitted by even Kissinger himself (C. Vol. 3, 2417), though the latter doesn't recollect going to Drawbaugh's shop on that occasion.

Considered by themselves, the two depositions of this witness tend strongly to strengthen defendants' theory, but taken in connection with the testimony of other of defendants' witnesses who swear substantially to the same facts, their force is greatly increased.

Leonard Swartz is another recalled witness. In his original deposition given for defendants (D. S. reb. 682) he testified that in the years 1875-76 he farmed Mr. David Cowen's farm; that during the year 1875, while he was plowing for corn-planting on said farm, Mr. Cowen put down some pipes between his spring and milk-house; that these pipes ran through the field that he, Swartz, was plowing at that time, and that Mr. David Webb dug the ditch in which these pipes were placed. In all this he is corroborated by David Cowen, John W. Cowen, David Webb and W. H. Swartz.

He further testified that he first heard of Mr. Kissinger's boring pipes about the time Mr. Cowen's pipes were put in; that Mr. Cowen went down to Kissinger's to see the latter's pipe, but concluded not to adopt pipe like them, but instead to employ square pipes, made of boards nailed together; that he got pipes such as last described, and laid them.

He didn't pretend to know when Kissinger's ram was put in, but was sure that the boring of the pipes took place at Kissinger's as early as the spring of '75, when Cowen's pipes were put in (Ibid. 687, Q. 60).

On his recall by complainants (C. Vol. 3, 2298), he admitted that complainants had sent Mr. Cowen and Mr. Kissinger to convince him that he was wrong about the date of the boring at Kissinger's, and that complainants' agents and counsel had also been arguing the case to him, showing him parts of the testimony most likely to influence him to change his former testimony. He also confessed that his independent recollection and belief at the time he first testified was that Kissinger's pipes were bored in 1875, but said he had been so far shaken by the arguments and evidence that complainants' agents had laid before him as to think he must have been mistaken.

Of course his original testimony was valuable only in so far as it embodied his own independent recollection of events and dates, uninfluenced by outside considerations, and his new testimony founded upon what complainants' agents had told him, was not his testimony, but theirs. His recall, indeed, does far more injury to complainants than defendants, since it exhibits to the court another example of their abominable methods in persuading and influencing witnesses.

John W. Cowen, another recalled witness, testified originally for defendants (D.-S. reb. 714), that he was the son of David Cowen; that Mr. Leonard Swartz farmed his father's farm during 1875 and '76; that prior to Mr. Swartz taking the farm his father had a sale of his stock, and sold all of his horses, except one, a young bay mare, which he retained; that in the month of September, 1876, he plowed two days and a half for Mr. Kissinger on the Draper farm, preparatory to sowing a wheat crop; that the team he used at that job of plowing consisted of his father's horse and one of Mr. Kissinger's horses; that while he was working there at that job he got his meals at Mr. Kissinger's house, and watered his horses below the spring-house; that one day when he was coming up to dinner he saw wooden pipes lying along a ditch, between the spring and the present location of the ram, which pipes were partly covered at the point where he took the horses to water (716); that Mr. Kissinger was fixing the pipe, assisted by old Mr. Meals, now dead.

He further testified that in the same fall, after that job of plowing, and some time in November, he visited the Centennial Exposition at Philadelphia, and that afterwards, and within a week of his return, he went on Kissinger's place to get a shovel which Kissinger had borrowed, and that he saw water running out of an iron pipe up near the house; that this pipe stood about 2 or 3 feet above the ground, and was curved over (718).

He also testified that in the fall of 1878 he saw Mr. Zimmerman, Kissinger's son-in-law, hauling, with a two-horse team and a large wagon, a lot of new iron pipe from the Marysville station, and that he afterwards learned that the new pipe was procured because the old ones had bursted.

This witness was positive in his testimony, and his whole first deposition shows that his memory is good, and that the circumstances about which he testified were fresh in his mind.

When it became apparent to defendants' counsel that complainants' agents were using every means in their power to get defendants' witnesses to come in and change or modify their testimony, or to at least express a doubt about its correctness, they sent for this witness, and upon examining him found that he had been approached on a number of occasions by Mr. Brooks and Mr. Beers, and that he had withstood all their arguments, and refused to give for them testimony different from that given in his first deposition; but, on the contrary, insisted that his first deposition was correct. Nevertheless, it appears that only a day or two after this interview with defendants' counsel, complainants' agents secured him, and got him to come in and testify as follows.

We give the only question put to him on the subject, and his answer thereto:

"Q. 5. In your former deposition you testified that you saw wooden pipes for the ram, and also saw the water running out of an iron pipe near the house on Mr. Kissinger's place, and you testified that you saw these things there in 1876; will you state now whether it was in 1876 or not that you saw those things there?

"A. I was positive at the time that it was in 1876, but since I have changed my mind; having conversation with others about the same thing, I found that I had made a mistake."

From this it appears that as the result of complainants' agents' arguments, or from some more reprehensible procedure on their part, he had been at last persuaded to come in and express a doubt about his former testimony.

No new or different recollection appears to have influenced him, but he admits to have been controlled merely by what others had told him since first testifying.

Eli W. Wise, another recalled witness, testified originally for defendants (D. S. reb. 926) that he was a member of the Chestnut Grove Cemetery Association, and had been secretary of the association since 1872. He testified to being present at the meeting of the association, when the subject of putting in a hydraulic ram at the cemetery was discussed; said that at that meeting he was instructed to get an estimate of the cost of putting in a ram; and that some time in the July following Mr. Drawbaugh came over and went up to the cemetery with him, and made an estimate.

He further testified that he did not specially get Mr. Drawbaugh to come up to Marysville to make the estimate, but that the latter happened to be there on business with Mr. Kissinger concerning a hydraulic ram which the latter had; and that at that time Drawbaugh left with the witness a bill for $19.80 against Kissinger, growing out of the ram matter, which he, witness, tried to collect, but failed.

He further testified that the fact that there was then a ram on the Draper farm was instrumental in causing the subject of procuring a ram for the cemetery to be brought up at that particular meeting of the association, June 4, 1877; that prior to said meeting, and he thought about May, 1877, he was on the Draper farm and saw the ram, that it was boxed over with boards, and, so far as he recollected, there were stones placed about it very ruggedly.

On his recall he testified that Mr. Brooks and Mr. Beers had been to see him, and had laid before him the evidence of Wagner and others of complainants' witnesses, and he testified that since Wagner's book showed the ram to have been walled in '78, it appeared to him that there could have been no wall about it in '77 (C. Vol. 3, 2330); and that while his recollection was that Drawbaugh went with him to the cemetery in the summer of '77 to make the estimate, and also that he did on some occasion leave a bill against Kissinger concerning the ram, yet it appeared to him that the bill could not have been handed him in '77, because the ram was shown by Wagner to have been walled up at a subsequent date. In other words, in response to complainants' agents' arguments, he concluded that because the ram appeared to have been walled by Wagner in '78, it could not by any possibility have been in without a wall, or with another and different wall, or protection, before that time.

But here again it is apparent that, so far as the witness has any personal recollection on the subject, it accords precisely with his first testimony for defendants, and his statement of his alleged mistake is simply a repetition of complainants' arguments, and not his own testimony at all.

If the court should find him to be in any real doubt about the date there is other evidence to show he is correct, for both Brabson (D. S. reb. 973) and Funk (Ibid. 911) testify that they were present with Wise at the meeting of the Cemetery Association on June 4, 1877, when the Kissinger ram was under discussion, and the minutes of the association of that date show conclusively that all of them were present at that time (Ibid. 927).

The effort on the part of the complainants' agents to induce Abraham C. Dissinger, one of the three assessors who made the triennial assessment at the Kissinger place in '76, to change his testimony was even more abortive.

The most they could get him to say was (C. Vol. 3, p. 2346), that while his impression was that he was on the Draper farm on the occasion of the assessment of '76, and had the conversation about the ram at that time, he would not say positively that it was at that time, because he had been assessor two terms. But since, in his first deposition, he testified that he never was on the Draper farm together with Mr. Morley and Dr. Traver, except on the occasion of the assessment in '76, and that Morley was sick and unable to take part in the assessment in '79, and since Mr. Morley and Dr. Traver both testify to the same effect, there cannot be the slightest doubt that the conversation which he remembers having had with Kissinger about the ram occurred in 1876 and not in 1879.

The extraordinary and unprofessional conduct of complainants' counsel in permitting their hired agents to thus go around and persuade defendants' witnesses to change their testimony, not by reason of any new facts within the witness' own memory, but by arguing to them the case upon the testimony of other witnesses upon whom they had been similarly working, and then trying to influence them by the conduct of such other witnesses, is, to say the least, highly discreditable to them, and, we think, will not be passed over by the court without censure.

Those witnesses who were actually recalled were by no means the only ones they endeavored to influence, but only those with whom they had any success. The assessors, Dr. Traver and Mr. Morley, and the log-pipe witness, John H. Harper, were so vigorously pressed—though without the slightest result—that defendants deemed it their duty to put them again on the stand for the purpose of further exposing to the court the complainants' methods.

Their depositions will be found at pages 152, 211, and 237, respectively, of defendants' testimony in sur-rejoinder.

While Mr. Harper was standing firm against their persuasions the argument was advanced by complainants' agents that he had nothing at stake and they had, but his reply, "that nothing but his principle was involved," was a fitting rebuke, and appears to have silenced them (D. S. rej. 239).

THE EVIDENCE OFFERED BY COMPLAINANTS IN SUPPORT OF THEIR THEORY

We will now turn to the evidence offered by complainants in support of their position in regard to the putting in of the ram, and as we proceed, request the court to note how effectually the most material parts of it harmonize with and fill out and complete the theory of defendants.

First, we have Mr. George W. Kissinger again. He evidently has no sort of an idea when the ram was ordered; let us see what he knows about its being delivered and put in, and about the preparations for it.

He testifies that, between the spring and the ram, wooden pipe was used, with the exception of two joints of iron pipe, which were next the ram to keep it from bursting (575, X. Q. 204); that the pipe between the ram and the house was all iron pipe (Ibid., 205); that the logs used for the wooden pipes were obtained on the farm, and that he bored them himself, assisted by his boys; that the boring was commenced *early in the spring, after he had been to Drawbaugh's with Draper;* in other words, according to complainants' theory, in the spring of '78 (553, Q. 17). He cannot say which of his boys helped him to bore (553, Q. 15).

His son, George Franklin, gives no testimony about the boring, but his sons, John and Cyrus, and his son-in-law, Zimmerman, all contradict him, the two former most flatly. John testifies that when he came from Chicago, about December 20, 1877, they were already at work boring the logs; that he helped finish them, and that they were all bored when he left, May 27, 1878 (C. Vol. 1, 575). Cyrus says that the wooden pipes were bored, put in the ground, and covered up in the fall of '77 (C. Vol. 2, 1478); and Zimmerman testifies that they commenced boring in 1877 (C. Vol 1, 651, X. Q. 307), but he cannot say whether before the 1st of September, 1877, or not (Ibid).

Notwithstanding these contradictions of him as to the year the boring was done, Mr. Kissinger's statement that he commenced boring the pipe for the ram in *the spring of the year after his visit to Drawbaugh's* has some significance, since it corroborates a number of defendants' witnesses who saw him boring in the spring of '75, which was the first spring after Draper swears the ram was ordered.

Another point in Mr. Kissinger's testimony deserves notice. He testifies that the auger with which the logs were bored for the wooden piping was obtained from Mr. Keller (572, X. Q. 211); that he personally went to Keller's for it, and asked him what he would charge for the use of it; that Keller replied that he didn't know, and thought that it ought to be worth a dollar; that he took the auger, used it, and took it back; that he never paid Keller; and that the latter has said nothing about it to him since (573, X. Q. 215). Cyrus contradicts himself flatly on this point by testifying, with equal particularity, that he himself got the auger from Keller's; that Mr. Keller and one of his boys were there when he got it (C. Vol. 2, 264, X. Q. 264); and he details the conversation which he says took place (Ibid., 1508). Either one or the other testifies falsely, or the auger was obtained from Keller's twice, viz.: once for boring the logs in the spring of 1875, as testified to by defendants' witnesses, and again at some subsequent period for boring more logs. Support to the latter view is found in the testimony of the Heisley boys, Christian and Joseph.

The next point in Mr. Kissinger's testimony deserving notice is what he says in regard to the bringing of the ram from Drawbaugh's shop. He says that he himself brought it over in a wagon (555, Q. 27), and that he brought along with it some pieces of pipe. But here again Cyrus contradicts him squarely by testifying that he himself brought the ram and some tools, but no pipe, from Drawbaugh's shop, in his father's wagon, and stopped at his father-in-law's to get his horse fed (C. Vol. 2, 1470), and his father-in-law and his mother-in-law, Mr. and Mrs. Boyer, testify that they remember of his stopping at their house, and seeing the ram and some tools in his wagon, and that Cyrus told them he had gotten them from Drawbaugh's (Mr. Boyer, Vol. 2, 1547; Mrs. Boyer, Ibid, 1542-3). Cyrus says that it was some time after Oct. 22, 1878, that he brought the ram and tools over (C. Vol. 2, 1470).

Either Mr. Kissinger or Cyrus is wrong, or both are right, and the ram was brought from Drawbaugh's on two separate occasions. If the ram was brought over but once, and Cyrus is right and Mr. Kissinger is wrong, then we have another proof of the latter's want of memory and utter unreliability. But if, on the other hand, Mr. Kissinger is right and Cyrus is wrong, the value of Cyrus' testimony on other points is destroyed. It is more than likely, however, that both of them are right, as in the case of the auger. We know that Mr. Kissinger brought the ram over once in the fall of '76, between harvest and corn-cutting time, because John Kaffenberger saw him bringing it (John Kaffenberger, D. S. reb. 953, Q. 16). And the probability is that when, in the fall of '78, the new iron pipes were purchased and the new wall built in the ram-pit by Jesse Wagner, the ram was sent to Drawbaugh's and brought back by Cyrus after being cleaned and fixed.

Zimmerman also thinks Mr. Kissinger, and not Cyrus, brought the ram over when it was brought (C. Vol. 1, p. 650, X. Q. 292).

A most transparent attempt was made by complainants in their closing testimony to straighten out and reconcile these conflicting and contradictory statements of Mr. Kissinger and his son Cyrus, in respect to getting of the auger from Keller and the bringing of the ram from Drawbaugh's shop. They recalled Mr. Kissinger, and got him to admit that he was wrong about having brought the ram, and to say that it was Cyrus who brought it, and that he brought something else, viz: Drawbaugh's tools (C. Vol. 3, 2408, Q. 43); and, on the other hand, to say that Cyrus was wrong about getting the auger from Keller, and that it was he, Kissinger, who got it.

They had evidently waked up to the fact that the auger and the ram had been making too many trips to suit their theory, and they called in this old man, whose recollection about everything is almost *nil*, but who would swear to anything for them, with the idea of trying, at least, to shade off the damaging effect of the original testimony. But they forgot their man, and overdid it, for Kissinger, while letting himself down in taking back his former testimony about bringing the ram, said it was *Drawbaugh's tools* and not the ram that he brought. Now it so happens that Cyrus in his testimony swears that when he brought the ram *he also brought the tools* (Cyrus, C. Vol. 2, 1471, Q. 80); and Mrs. Boyer, his mother-in-law, testifies that she saw both the ram and the tools in Cyrus' wagon (C. Vol. 2, 1543, Q. 17) when the latter stopped at her house on his way back from Drawbaugh's. So, notwithstanding Mr. Kissinger's assertion that he brought Drawbaugh's tools and not the ram, it stands proved that Cyrus also brought the tools, and defendants' position that the ram, as well as the tools, was brought over from Drawbaugh's shop on two distinct and separate occasions, is thereby materially strengthened.

In his first deposition, Mr. Kissinger does not undertake to say just when the ram was put in. All that he says is, that it was put in the year after he and Draper were at Drawbaugh's shop; adding this qualification, however: "As near as I can recollect, if my mind carries me right" (574, Q. 227).

John says he never saw the ram (C. Vol. 1, 576); George Franklin thinks that the ram came after the new pipe was delivered, in Sept., 1878 (C. Vol. 1, 582); and Cyrus says that the ram was put in, he thinks, in the fall of '78, just prior to the visit of Mr. Draper in that fall.

Zimmerman, the son-in-law, gives more particulars. He says that Mr. Drawbaugh came over for the purpose of putting in the ram Monday, Nov. 4, 1878; that on the morning of the following day, which was election-day (Nov. 5, 1878), he voted early at Marysville, and then took his wife and children over to visit relations at Landisburg; that before they left, Mr. Drawbaugh was there getting the iron pipe ready to put in (C. Vol. 1, 645); that he came home on the following Monday; and that the ram was then in and running (658).

The gist of the testimony given by all the members of the Kissinger family is, that there was no hydraulic ram on the Draper farm prior to the fall of 1878, and no preparations made for a ram prior to the fall of 1877; but in view of the overwhelming mass of positive evidence to the contrary of this, the conclusion is inevitable that they are all certainly wrong, and have either wilfully perjured themselves, or else have been argued into the proper frame of mind by complainants' agents, and then put on the stand in that condition to give out as testimony not their own independent recollections and memories, but that which has been forced upon them by others.

The operations of complainants' agents upon them began at a very early day. They were there to see the

Kissingers before the existence of Mr. Draper was known to defendants. In fact, the very same man who first interviewed Mr. Draper in January, 1882, went directly from Dover to Easton to see Mr. Kissinger, as the latter himself testifies (C. Vol. 1, 573, X. Q. 226), and from that time on the record shows the frequent visitation of other of complainants' agents, especially Mr. John C. Comfort.

We have seen what pressure was brought to bear upon those of defendants' witnesses who were recalled by complainants, notably David Cowens, and upon those also who refused to be influenced, such as Dr. Traver, Mr. Thomas W. Morley and Mr. Harper, and from this can judge how far witnesses could be persuaded to go who were not at all embarrassed by any previous sworn statements honestly given and based solely upon their own independent recollections.

Aside from this well-founded criticism, the testimony of the Kissingers is of negative character. They say that things did not exist at times at which a greatly preponderating number of witnesses for defendants most positively testify they did exist. We have elsewhere discovered evidence of this character, and shown its utter worthlessness.

The character of Mr. Kissinger, as given by his neighbors, is that he is slow, procrastinating, careless, negligent, dilatory, always hard up, never paying his debts, and forever borrowing (David Cowens, D. S. reb. 703; I. H. Harper, Id. 658; Leonard Swartz, Id. 689; John W. Cowen, Id. 724-5; Brabson, Id. 971; Strine, Id. 799-1005). He rented the farm of Mr. Draper, but was always behind with his rents, and is to this day indebted to him (Draper, D. S. rej. 181). As an example of his thrift, we find the appraised value of his horse when he lived at Milltown to have been $5! His unreliable memory and confessed perjury we have hereinbefore commented on.

Zimmerman's character and memory have also been criticised. If he could swear positively that Mr. Draper was not at the farm prior to the fall of 1877 (Vol. 1, 661, X. Q. 416), when the latter is proven conclusively to have been there in Feb., 1877, for a number of days, and could, with equal positiveness, swear that Mrs. Draper was never up to the farm with her husband, when she was, in fact, there for a week at the time of the alleged occurrence of other events about which he testifies, he certainly could be easily mistaken in his facts and dates abous the ram.

John Kissinger, as we have seen, never saw the ram, and don't pretend to know much about it.

George Franklin admits having told complainants' agents, after a previous interview with them, that he and his father and brothers had talked the matter over and had "fixed upon" the dates (C. Vol. 1, 586, X. Q. 42).

Cyrus' memory for dates is bad. He cannot even say whether his father moved from Marysville to Easton, Maryland, in 1880 or 1881, though that was a recent event and likely to make an impression upon his mind (C. Vol. 2, 1479, X. Q. 172), but he can with positiveness testify that Mr. Draper was up to the farm in the fall of 1876 (Ibid. 1484, X. Q. 235), and that he was not here in the fall of 1877 (Ibid. 1481, X. Q. 197), while the proof is absolute that Mr. Draper did not go near the farm in 1876, and that he was there in the fall of 1877. His account about getting the auger from Keller is very detailed and circumstantial (Ibid. 1508, Q. 523), yet, if his father's testimony be true, it is all a miserable lie from beginning to end.

Other witnesses, outside of the Kissinger family, relied upon by complainants to show that there was no ram in prior to 1878, are George W. Boyer and his wife, George E. Zehner, J. J. Kerr, Mrs. Thos. Draper, Miss Virginia M. E. Draper, Henry Foulk, Benj. Franklin Zimmerman, Mrs. Louisa Crouse, John M. Vink, Mrs. Sarah Moore, Robert O. Moore, John J. Wenrich, Simon G. Eppler, Herman J. Eppler.

Mrs. George Boyer is a witness of a purely negative character. She testifies (C. Vol. 2, 1543) that she went up to the Draper farm in peach season of 1878, and at that time helped fetch some water, and got it out of the spring itself. She says she didn't see any ram on the place; neither did she see the wooden feed-pipe that led from the spring (C. Vol. 2, 1545, X. Q. 44) where she got the water; though the testimony of Mr. Kissinger and his boys' shows that that pipe was in at that time, and had been since the spring of 1878, while defendants' witnesses prove it to have been there as early as 1876. This does not speak well for her observation of things on the farm, but is a good illustration of the value of negative testimony.

The ram itself was an inconspicuous-looking object, and below the surface of the ground (see Exbt. Photo of Kissinger Place, Nos. 4, 5, 6), and was not a thing to attract her attention.

It is not singular that they had to bring water at that time from the spring by hand, because Zimmerman, who lived on the place, testifies that the ram didn't work in dry weather when the spring was low (J. Zimmerman, C. Vol. 1, 650, X Q. 401). Peach season is a dry time of the year, and the spring when she was there was probably too low to work the ram, or else the ram was not running because of some of the various disorders with which it seems to have been frequently affected. If they wanted drinking water the spring was the place to get it, for the evidence is that that which passed to the house by way of the ram was too warm to drink.

Geo. W. Boyer, another negative witness, says he, also, was up at Kissinger's in the peach season of '78, and *didn't* see any ram, though they told him they were going to put one in (C. Vol. 2, 1548). What they told him, if anything, was, probably, that they were going to *re*-put the ram in or repair it.

G. E. Zehner, a preacher, is another negative witness (C. Vol. 3, 1840). He says he also was at Kissinger's in peach harvest in August or September, 1878; that he took a meal there; that he heard complaints of the difficulty of getting water. He didn't see the ram; wasn't told there was not one there; wasn't told they were going to get one there, but is "*morally positive*" that there was none there *in successful operation*, or there would have been water, and no complaints about the difficulty of getting water.

He didn't remember to have seen pipes nor logs, nor horses, nor the dry-house, nor the bake-oven, nor other objects proven to have been on the place at the time, and about the only things he does remember seeing, and in regard to which he is more than "*morally positive*," were peaches, and of these he seems to have gotten plenty.

J. J. Kerr, also a preacher, is another negative witness. He was called (C. Vol. 3, 1873) to prove that while he made several pastoral visits to Mr. Kissinger's family in 1878, he didn't see any hydraulic ram nor any pipes there. On cross-examination the fact was developed that when he called he always went in at the front door, and from there to the parlor, and never at any time went around back of the house, or to any point where the position of the ram or pipes could be observed. It was never contended that there was a ram at the front door or in the parlor. The most he can say is that Kissinger one day in the fall of '78 came in, in his shirt sleeves, apologized for his appearance and said he was getting ready for the ram. It is quite probable that at this time the repairing and reconstruction of the ram was taking place.

William Ross, another of complainants' witnesses, testifies (C. Vol. 3, 1811) that he worked for Mr. Kissinger from the spring of '76 till August of that year. He attempts to fix the date by the circumstance that at that time his father was living in Henry Eichelberger's house. But this proves nothing, especially in view of the fact that he says, upon cross-examination, that he don't know when his father moved in that house, nor when he moved out of it (1825, X. Q. 130, 131).

He alleges that while he was working at Kissinger's the water was carried up from the spring; that there was no ram on the place; that no preparations were being made, or had been made, for a ram; that there were no logs that had been bored for pipe, though there were some fence-posts for a post and rail fence, which he says were lying east of the barn, near the pale fence, and which he also says, in answer to a leading question putting the precise words in his mouth (1814, Q. 28), were near the *cherry trees.*

He further says, that after he left Kissinger's, in August, 1876, and in the peach season of that year, he noticed two drains or ditches, which had been dug on each side of the road, which led from the house to the barn to drain the water down from the house.

The object in calling this witness was evidently, therefore, first to disprove that there was a ram on the farm in 1876; secondly, to contradict defendants' witnesses, Mr. and Mrs. Champion and Mrs. McFarland, who had testified to seeing, in 1876, the pile of bored logs lying east of the barn, by showing that what they must have seen was the pile of fence-posts that this witness refers to; and, thirdly, to contradict those of defendants' witnesses who testify to seeing trenches for the ram-pipes between the house and the ram, and to show by this witness that what they saw were the little drains alongside the road between the house and the barn.

We have seen that the witness is not able to satisfactorily fix the time when he was working for Kissinger as being in 1876. If he ever worked for him, which is exceedingly doubtful, as no one corroborates him in this, it might have been before '76, or some other time. As to the fence-posts, while he is able to say posi ively that there was a pile of fence-posts lying at the place he describes, he can't say whether they were in one pile or two piles, nor how long or how thick the posts were, nor how high nor how broad the pile was, nor any particulars, or any approximation to particulars, about it. He says, however, he was never within thirty yards of the posts, which is a sufficient reason for his not being able to testify more particularly about them, and also perhaps a reason for his not knowing whether they were fence-posts or log pipes.

Concerning the drains along the road between the house and the barn, he admits in his cross-examination that he didn't see them in the peach season in 1876, as he testified to in his examination-in-chief, but that it was about two years after he left the Kissinger farm that he saw them (1823, X. Q. 113); or, in other words, in 1878.

It is more than doubtful if there were *ever* any drains at the place he speaks of. The hill is a very steep and even one, and there is no necessity for them. What the complainants were endeavoring to exaggerate into ditches, and have even placed on the "Ives Survey" (C. Vol. 3, 2450) as such, are nothing more or less than the ruts of the old road, which is faintly seen in Defendants' Exhibit Photo. Kissinger Place, No. 5.

The vague, indefinite and negative testimony of this witness, if believed, would not be sufficient to overcome the positive testimony of the witnesses he was called to rebut; but whatever probative force it might otherwise have, it so completely vanished before facts developed in his cross-examination, that we have not the slightest idea the court will give his testimony a particle of credit; on the contrary, we believe that the calling of him will react upon the complainants, and lead the court to believe that in their extremity he was procured to swear falsely. In the first place he appears to have been sworn and examined under an assumed name, for he admits (X. Q., 154) that his true name is not "Ross," but "Forkenross." And while he denies that he is not commonly known in and about Marysville as "Chicken Ross" (X. Q. 149), the fact that he is known in that neighborhood by such euphonious title is abundantly proven by three respectable citizens of Marysville, namely: Francis S. Strasbaugh (D. S. rej., 114), Ephraim P. Brenneman (Ibid., 115), and Aaron H. Coel (Ibid., 115).

He admits that he has not been in Marysville for two years, though he protests that there is no particular reason for his having stayed away, but when pressed confesses that during that period there was a charge of fornication and bastardy lodged against him, which he after settled by paying the prosecutrix (X. Q., 142, 143). He also swears that this was the only charge of a criminal nature ever made against him (X. Q., 144); but afterwards, not being able to stand up under the cross-examination, admits that he was at one time charged with stealing pigeons, and at another time with stealing chestnuts, and with disorderly conduct. As to the chestnut charge, he says he was released upon paying for the chestnuts and the cost of the proceedings, the recollection of which upright course of conduct tempts him to certify to his own character by the remark: "We were honest, that's the reason we paid it; other ones slipped."

But this burst comes too early, for he afterwards admits being discharged by Mr. Al. Seidel because of being caught in improper relations with a colored woman in Mr. Seidel's employ (X. Q., 165), and also confesses to having stolen corn from Mr. Seidel's corn-field, and being caught at it by Mr. Harry Seidel, adding, most honestly: "*I never deny the truth*" (X. Q., 179).

All these, and other irregularities in his conduct, show him to be a low-lived fellow and a petty thief, to have well earned his title "Chicken Ross," and to be a person who could be made to swear to most anything for a trip to Philadelphia, and his "witness fees" of five dollars a day and expenses, the usual rates paid by complainants (see Cowen, C. Vol. 3, X. Q. 47).

Mrs. Thomas Draper and Miss Draper were both called by complainants, the former to prove that she was at Kissinger's with her husband in November, 1877, and didn't see the ram, and the latter to prove that she was there with her father in November, 1878, and did see the ram. Mrs. Draper only says she doesn't think there was any ram there (C. Vol. 3, 1882). But, as she was there but four or five days, and was only at the Kissinger house mornings and evenings (X. Q., 31), and didn't go about the farm much (X. Q., 45), her opportunities for noticing whether the ram was in or not were not very good. As an illustration of how little she observed, she testifies, when asked if she noticed any improvements on the building since she was last there, that she did not, though it is proven most conclusively that just previous to that time the new front porch had been built and the large observatory had been put on top of the house. She says several things, however, in her cross-examination, that tend to strengthen defendants' theory; for instance, that her husband visited the farm about once a year while Kissinger lived on it, and that prior to that visit of hers to Marysville she had heard talk about the putting in of a ram on the place.

Miss Draper says that she arrived at the farm Monday, Nov. 11, 1878, and remained until the following Friday evening, and she *judges* that the work on the ram, which was then in, was not all completed, because the end of the discharge pipe was propped up on boards, and there was no upright piece on it to throw the water out (C. Vol. 3, 1887, Q. 10); but her recollection about this must either be faulty or else Jesse Wagner, the stone-mason, another of complainants' witnesses, cannot be relied upon, because, he says that when he was there, walling in the ram, on the 6th and 7th days of Nov. 1878, four days before Miss Draper got to Marysville, according to her testimony, the discharge pipe was then in place; that it rose up about three feet from the ground, and was bent over and downward, and discharged into a tub or barrel placed beneath it (C. Vol. 2, 1260, X. Q. 41 and 36).

Defendants' theory is strengthened by her cross-examination also, as she testifies that it was the habit of her father to visit the farm about every year, after Kissinger moved on it (1890, X Q. 39), and that she thinks her father was up there at least twice previous to 1876 (1892, X Q. 53), thus corroborating Mr. Draper, who says he was there once in the summer or fall of 1874, and again in the spring of 1875.

Henry Foulk testifies that one time his son-in-law Reuben Wallace, thought of renting the Draper farm, but did not because he thought the farm too small, and also because the water supply was inconvenient.

He further says that after this, on an occasion when Mr. Draper was up at Marysville with his wife, Mr. Draper told him that he had intended to get a ram put in to carry the water up to the house (1850, C. Vol. 3, Q. 17), and that on another occasion, when Draper was up with his daughter Jennie, he saw the ram in operation but not working satisfactorily (1852).

The value of this witness' testimony centers about the time when Wallace made the objection to occupying the Draper farm, and the time of the witness' talk to Draper about it. The fact that Mrs. Draper, on one occasion, and that Miss Jennie Draper, on another occasion, accompanied Mr. Draper to Marysville, is one admitted by both complainants and defendants, and is proved by witnesses on both sides.

Now inasmuch as the witness says Wallace made *two* objections to occupying the farm, to wit: that respecting its smallness and that in regard to the water supply, it is quite possible that, as a matter of fact, he made but one of these objections, to wit: that in regard to size; and the other objection the witness has, perhaps, unconsciously supplied himself, thinking from his pretended knowledge of the matter that Wallace must have made that objection also. Wallace is still living, and it is a significant fact that he was not called by the complainants to put the matter beyond question.

Then as to the time when the alleged objections were made by Wallace. The witness says that Wallace at that time was living on Mr. Keller's farm, and that he lived there from the spring of 1877 till the spring of 1878. This does not intimately concern the witness' own business. Wallace may have lived somewhere else at that time. The witness says that Wallace at different times lived on John Rose's farm, Mr. Rinehart's farm and two different farms of Keller's, and the date when Wallace moved on either of these farms is not positively fixed by any evidence, nor is the length of time he lived on either of them positively fixed.

But suppose the fact to be admitted that in 1877, say, Wallace objected to going on the Draper farm because of the inconvenience of the water supply, does that militate against defendants' theory? Certainly not. The testimony of a score of defendants' witnesses is to the effect that though the ram was on the farm in 1876 and 1877, it was most of the time out of order from breakage, freezing, leaky pipes, or because of low water, and the testimony of the Kissinger family shows that even after the improvements wrought by the putting in of the new iron pipes and the stoning up of the pit by Wagner, in 1878, the ram did not work well nor satisfactorily, and all agree that it stands at the present time useless and impotent to perform its functions, and has been in the same condition for years.

It cannot, therefore, with truth be said that at any time, either before or since the ram was put in—whenever that was—the Draper farm has not been objectionable because of the inconvenience of the water supply; and if, in fact, it be true that Wallace at one time told this witness that he could not occupy the Draper farm because of the inconvenience of the water supply, it by no means follows that he must have so told him prior to the putting in of the ram, for the same remark could with truth have been made at any time from the clearing of that farm down to the present day.

In respect to the alleged declaration of Mr. Draper that he intended to put in a ram on the farm, it is clear that the witness may be mistaken as to the time when it was made, if ever. He testifies that he had known Mr. Draper for eighteen years, that when the latter lived in Marysville they frequently visited; that when Mr. Draper came up to Marysville from Delaware he always came to see him (1856, X Q. 57), and that he so came up once nr twice a year (Ibid. X Q. 59), and that he thinks he came up twice the first year after Kissinger moved on the place (1857, X Q. 62).

From this it will be seen that it may have been on the occasion of some other visit than that of the fall of 1877, that Draper made this declaration to him. He is certainly wrong about going over to Bloomfield with Draper at the time that Draper was up with his daughter, as he testifies (1853, Q. 35), if the daughter herself is to be credited, for, while he says that on that occasion he went to Bloomfield with Draper on Saturday, and that returning Draper stayed over Sunday with him, Miss Draper testifies that she and her father were only at Marysville between Monday and Friday night of the same week (Miss Draper, 1889, X Q. 24). About the Bloomfield trip, he has evidenntly confounded Draper's visit with his daughter with some other visit, and it is fair to presume that, in like manner, he has confounded Draper's visit with his wife with some other visit.

This reasoning strikes one with additional force in view of the fact that the witness is about 70 years old, and admits that his memory is bad (1856, X Q. 56).

John J. Wenrich was called by complainants (C. Vol. 3, 2376) to rebut, in a rambling and indefinite way, the testimony of those of defendants' witnesses who had seen Kissinger boring logs in 1875. His testimony is to the effect that during the summer of 1875 he was engaged in chopping wood, building a pig-pen and a shed near the dwelling house, on the Draper farm, and that while this work was going on there were timbers lying about the place. These timbers complainants hope the court will conclude were the identical timbers defendants' witnesses saw. But we think there is no liability of the court going wrong about this. None of the timbers are shown to be of a size or kind suitable for piping, and none of them appear to have been bored in any manner. If defendants' witnesses had merely testified to seeing timbers on the Kissinger place without remembering how they looked, or what was being done with them or to them, or where they were, testimony of the nature offered by this witness might have some slight weight; but when defendants' witnesses testify with particularity to having seen Kissinger boring logs with a pipe-auger, and to having sat on the logs and conversed about the work being done upon them, and the purpose for which they were intended (see, for instance, testimony of John H. Harper, D. S. reb. 654, and Joseph Gensinger, Ibid. 770), there is not the slightest probability that they can be mistaken.

Robert O. Moore (C. Vol. 3, 2371) testifies to having seen timbers lying on trestles near the barn on the Kissinger place while passing along the Valley Road about June, 1878 (2372), and to have afterward inquired of Mr. David Cowens what Kissinger was doing with those logs, and to have been informed that they were going to put a ram in to throw water up to the house.

It is highly improbable that this witness, or any one else, would have noticed, or could have been able to distinguish, such an object as a log lying on trestles at a point so far from the Valley Road as the enclosure east of Mr. Kissinger's barn was.

Two photographs, taken with powerful magnifiers, were put in evidence by complainants to show that this enclosure could be seen from the Valley Road; but the photographer, James K. Cotterel, produced to prove the photographs, was obliged to admit that he could not distinguish with his naked eye a cart or wagon within that enclosure from the point where the photograph was taken (C. Vol. 3, 2403, X. Q. 26). Moreover, the witness, in saying that he saw Kissinger boring logs in June, 1878, contradicts Cyrus Kissinger, who says the logs were all bored and laid in the ground in the fall of 1877, and also contradicts John M. Kissinger, who testifies the logs were all finished when he left home, in May, 1878.

Attention is especially called to the vague and indefinite manner in which Moore testifies. He "thinks" Mr. Cowen told him; he "thinks" it was about June, 1878; he "thinks" he was hauling stone for Jesse Wagner, etc.; he "supposes" he was on the wagon; and he "thinks" the logs and trestles were on the bank, between the fence and the ram.

Mrs. Sarah Moore (C. Vol. 3, 2369), the wife of Robert O. Moore, testifies to having been on the Kissinger place in the spring of 1878, and when she is asked how the Kissinger family got their water during that spring and summer, she ventures the very unsatisfactory opinion that they "carried it up that hill, so far as I know."

She also testifies to having seen, on a later occasion, a barrel in which the ram-pipe discharged, and that her father bought that barrel at Kissinger's sale in 1880, and has it yet; but this does not, by any means, prove that that barrel, or that the ram, was not at Kissinger's when she was there in the spring of 1878, and before that time.

Mrs. Louisa Crouse and John Vink (C. Vol. 3, 2467; Ibid. 2480) were two witnesses called by complainants for the purpose of corroborating the Kissinger family about the bursting of the iron pipes, and to contradict two of defendants' witnesses, viz.: John H. and Joseph W. Rhoads, who had testified to seeing a screen on the end of a wooden pipe in the spring on the Draper farm in the fall of 1876.

Mrs. Crouse's former name appears to have been Mrs. Stotter, and between the years of 1874 and '80 she kept a tin shop in Marysville, and between Jan'y, 1878, and March, 1879, employed Vink as one of her workmen. She produces a book in which there appears an entry under date of Nov. 4, 1878, of a charge against George Kissinger, reading as follows: "To funnel and soldering pipe, .75."

Both of them pretend to remember particularly about the items contained in this charge, and the circumstances under which the charge was made, but so apt are their memories in regard to this particular charge, and so very poor are they in regard to other charges against Kissinger in the same book, that the conclusion is irresistible that they had been considerably coached.

Both of them undertake to say that the "funnel" referred to in the item was not a funnel at all, but, according to Mrs. Crouse, a screen, and according to Vink, a strainer, which Kissinger said he intended to use on a pipe to prevent dirt and leaves from flowing into such pipe from his spring.

They also both say that the pipe, which appears by the entry to have been soldered, was one of Kissinger's iron ram-pipes. Her testimony is that, on the morning of Nov. 4, 1878, Mr. Kissinger came to her shop, brought a piece of pipe to be soldered, which he said had been frozen and bursted shortly before, and ordered the funnel to be made; that the funnel was made and the pipe mended the same day, and she thinks somebody else than Kissinger came for them and took thme away.

Vink, on the other hand, testifies that Kissinger came down and ordered the funnel made, and came back the same afternoon and got it, and that on the following day he came down about 7:30 o'clock in the morning and brought the pipe, which was bursted, and which, he said, he wanted mended; that he charged both jobs under one entry.

Both of them and the book entry contradict James Zimmerman, who testifies that there was no pipe at all in before Drawbaugh came, Nov. 4, '78 (C. Vol. 1, 658, X. Q. 78), and that Drawbaugh was only getting ready to put in the pipe Tuesday morning, Nov. 5, '78, when he left home (Ibid. 645, X. Q. 232), and that it bursted after he came home, Nov. 11, '78 (Ibid. 658). If Mrs. Crouse and her book are correct, the pipe which Kissinger brought to her shop Nov. 4, must have burst before that time; and it could not have burst the night before, as, according to Vink, the pipe was brought about 7 o'clock in the morning, and it was dry, and there was no ice nor frost in it, as there would have been had it burst so recently from freezing.

Mr. Kissinger, on his recall, tried to straighten out this matter of the bursting of the pipes, and testified (C. Vol. 3, 2411) that *one* pipe burst from freezing the first night it was laid, and that two joints burst again about four weeks afterwards (Ibid. 2412).

But, as usual, he contradicts Cyrus, who testifies positively that the first night the ram was put in the *two joints* of pipe burst (C. Vol. 2, 1487, X Q. 275).

If Vink's testimony about the conversation with Mr. Kissinger when he made the funnel for him on the 4th of Nov., 1878, be true, certain it is that the wooden pipes had been used, and that the ram had been in operation long prior to that date, for he says that Mr. Kissinger complained to him about having had a great deal of trouble with the leaves and dirt getting into his wooden pipe and clogging it up, and that he, Vink, after the difficulty had been described to him, got up this screen for him (C. Vol. 3, 2486).

The positive testimony of defendants' witnesses, John H. and Joseph W. Rhoads, that they saw a screen on the end of the pipe in the spring in 1876, is not overcome by any evidence, however positive, that a screen was made for the pipe in '78, for it is quite likely that the one first put on, being in an exposed place and liable to be knocked off every time a pail of water was dipped from the spring, had become lost or damaged by accident or age, and the the pipe clogged up, so that when the general renovation of the ram took place in the fall of '78, it became necessary to provide a new screen.

Herman J. Eppler and his brother, Simon G. Eppler, both give testimony as to the preparatory work for the ram in the Kissinger place.

Herman says (C. Vol. 3, 2180-1) that in the latter part of 1877 he and his brother Simon were out hunting, and in passing up through the woods on the Draper farm, noticed that some chestnut timber had been cut; that they went down and inquired of Mr. Kissinger, whom they found at the barn, what the timber had been cut for, and that Mr. Kissinger said he had cut them for pipes or spouting for the ram. He further says that the first time he ever saw the ram was in the fall of 1878, when Miss Draper was there, and he produces a letter from Mr. Draper to himself, dated Dec. 18, 1877, in which mention is made of the ram, and says that at the date of that letter the ram was not in.

It is not necessary at this point to reiterate our remarks upon the untruthfulness, unreliability and bias of this witness, made in considering his testimony on the subject of the ordering of the ram, but refer the court back to the former discussion of him (Ante, p. 7).

As against the clear and positive testimony of Mr. Draper in regard to the ordering of the ram, the testimony of such a man as this cannot stand, nor can what he says about the cutting of the timber for the log pipes overcome the positive testimony of the numerous unimpeachable and unassailed witnesses for the defendants who swore to the boring of such pipes in 1875. From the fact that he was at one time Mr. Draper's agent it does not follow that he was in a position to know more about the ram than Mr. Kissinger's neighbors, who testify for defendants about the existence of the ram in 1876–7, but quite the reverse. He lived in the village of Marysville, and attended to his shoe store. They were close by the Draper farm, and their opportunities for knowing what was going on there were better. In point of fact, he admits that he had nothing to do with the ram nor the ordering of it, but that it was purely a matter of arrangement between Mr. Draper and Mr. Kissinger (C. Vol 3, p. 2263).

Indeed, so far as the cutting of the timber for the pipes is concerned, this witness testifies that his brother, Simon G. Eppler, had a dispute with him, prior to being called to the stand, as to when such cutting took place, Simon insisting that it occurred in 1876, and that at that time they went down to Mr. Kissinger's, and that he, Simon, went and looked at the ram (X. Q. 726), and Simon himself, when called to the stand (C. Vol. 3, 2325), does not venture to swear on his own recollection when the occurrence took place, but only says that it was after his brother Herman became Mr. Draper's agent, and he knows it was then from the fact *that Herman told him so!*

Attempt, no doubt, will be made by complainants to construe the passage in the letter of Mr. Draper to Mr. Eppler, dated Dec. 18, 1877, referring to the ram, to mean that at that time the ram had not been put in. Let us see if such a construction be a fair one. Here is the letter:

MAGNOLIA, Decem. 1, 1877.

MR. HERMAN EPPLER.

Dear Sir,—Inclosed I return the agreement for Kissinger with the stock claus entirely left out. The understanding between him and me was, that I was to find one-half the young stock and one-half the corn to feed them. My only object was to feed the grain on the farm, so as to improve it. But if Kissinger don't like that, all right with me; and if He won't sign this agreement, He can stay under the old agreement and pay a certain Rint; and if he don't like that I think the Farm can be Rented to Esqr. Foulk's son-in-law, Mr. Wallace. Kissinger could pay all his Rents in improvements if he would. The Ram to throw up the water he was to put in, and the Barn wants repairing. There needs a back Poarch and smoke-house and Privy. He could haul the stone, do the carpenter-work, and change around so as to have but little money to pay; but I must have my rents in some way. I can't afford to keep the property and get nothing for it. I think I am as easy satisfied as anybody could be, but I must have my rents somehow. Write to me at once and let me here what he does.

The calculation is now that my vessel will go to Philadelphia next trip. If she does, you may look for the Oysters about the middle of next week.

We are all well as usual.

Ever truly,
THOMAS DRAPER.

To properly construe this letter one must put himself in the writer's place. The old agreement between Mr. Draper and Mr. Kissinger has evidently not been satisfactory, and there has apparently been trouble about the payment of the rent. Mr. Draper makes out a new lease, and sends it to Mr. Eppler for Mr. Kissinger's approval. In his letter of transmittal he desires to indicate to Mr. Eppler how easy "Kissinger could pay all his Rents in improvements if he would." Of the barn, porch and smoke-house, etc., he speaks in the present tense, "the Barn wants repairing," now, presently, "There needs a back Poarch, and smoke-house and Privy," etc., but when he comes to allude to the ram, his mind turns from the present to the past, and he says, "The Ram to throw up the water he *was* to put in," using the past tense. He is thus careful in the use of his language to distinguish between what is yet to be done and what *has been* done.

The great preponderance of evidence shows that Mr.

Kissinger had, as early as 1876, put in the ram at his own labor and expense, and was to be allowed for it. No settlement had been made at the date of the letter, and none was in fact made till November, 1878 (Draper, D. S. rej. 177), nearly a year afterward, and then, as we have seen, the charge for the ram *was put back into the account for 1876, where it belonged* (D. S. rej. 178).

The whole tenor of the letter shows that Mr. Draper appreciated that the quickest way to get anything out of Mr. Kissinger was to have him put improvements on the farm and be allowed for it, and he indicates to Mr. Eppler that the barn wants repairing, and that a back porch, smoke-house, etc., are needed, and cites the ram merely as an instance where Mr. Kissinger had earned a credit on the rent account by reason of an improvement made by him.

He says that the barn wants repairing, and that the porch, etc., are needed, but it will be carefully noticed he does not say the *ram wants to be put in!*

The complainants appear to have long doubted the propriety of putting this letter in evidence, as they had it a year in their possession before producing it.

Benjamin Franklin Zimmerman, another purely negative witness, testifies that in the spring of '77 he visited his brother, J. C. Zimmerman, on the Kissinger place, and at that time the family brought water from the spring in buckets, and that he, too, brought some in that way. He says he didn't see any ram there; but, as a matter of fact, if he had he would not have known it, because he admits that up to that time he had never seen a hydraulic ram, nor anything said to be a ram (C. Vol. 3, X. Q. 82). The fact that they were bringing water from the spring in buckets does not prove that there was no ram on the place, because his brother, James, tells us that after the ram was there it was often out of order and would not work, and that they then had to carry water up in buckets (C. Vol. 1, 659–660) at such times.

Besides the foregoing testimony offered by complainants we have the evidence of the railroad books (C. Vol. 1, 554 and 555; C. Vol. 3, 2491) which show that two bundles of iron pipe were received at Marysville, from Philadelphia, consigned to Mr. Drawbaugh, and were delivered to Zimmerman on Mr. Kissinger's order some time in September, '78. We have further the testimony of defendants' witness Strine (D. S. reb. 1007, X. Q. 77), to the effect that in the latter part of the summer—but what year he could not recollect—he heard Mr. Kissinger complain in Mr. Morley's store about the non-arrival of some pipe which he expected by rail (Ibid, 1001, Q. 40), and the testimony of three others of defendants' witnesses, namely, Henry Shaffer (D. S. reb. 874, Q. 20), G. W. Rhoads (Ibid, 1051), and John W. Cowen (Ibid, 718), and of Zimmerman himself (C. Vol. 1, 630, X. Q. 86), to the effect that Zimmerman some time in the fall of '78, and probably in September, hauled those pipes from the Marysville station out to Mr. Kissinger's, and we have, in addition, the testimony of complainants' witness, Jesse Wagner, supplemented by a book entry, to the effect that on the 6th and 7th days of November, 1878, he built a stone wall around the ram, which was in at that time (C. Vol. 2, 1258).

The evidence offered by both complainants and defendants concerning what was done to the ram in 1878 tends simply to establish the fact that at that time steps were taken by the Kissinger family to make the ram what it had not up to that time been—a practically operating and serviceable contrivance; and the establishment of that fact is not only not in conflict with defendants' theory, but is in entire harmony and accord therewith. A glance back at defendants' testimony will demonstrate this. Their witnesses, Theo. Fenn, Peter Kaffenberger, Gault, Fesler, Strine, W. W. Meals, James Champion, the carpenters (Brabson & Taylor) who worked on the porch and observatory job, the Board of Triennial Assessors for 1876 —*i. e.*, Dr. Traver, Mr. Dissinger, and Mr. Morley—and the members of the Cemetery Association (see Brabson), all testify that the operation of the ram during the years 1876 and '77, at the times they respectively saw it, was intermittent, uncertain and unsatisfactory; that sometimes it would run and sometimes it would not; and when it did, it delivered a sluggish stream, which, according to Theo. Fenn, was about the size of a goose-quill (D. S. reb. 781); according to Strine, was about the size of a rye-straw (Ibid. 1001); according to Peter Kaffenberger, was so meagre and came so slow as to discourage him from putting in a ram like it on his own place (Ibid. 919); and which, according to Brabson, Taylor & Clendennin, when it reached the point of discharge in the summer season was so warm as to be unfit for drinking purposes (Ibid. 972).

Not only does the supply appear to have been deficient, but the ram itself appears to have been continually getting out of order, as testified to by Champion, Strine, and the triennial assessors, among others, while the wooden pipes were leaky at the joints (Strine, Ibid. 1000), and the metal pipes were old, rusty, imperfectly joined, and constantly bursting (Strine, Ibid. 1001; Theo. Fenn, Ibid. 781, Q. 39; Henry Shaffer, 873; Gault, 863, Q. 45; Funk, 913, Q. 18). The testimony of the unsatisfactory character of the ram and its pipes is not based solely upon the opinions formed by the witnesses when they saw them, but they testify to declarations made by Mr. Kissinger himself to the same effect (Theo. Fenn, Ibid. 781, Q. 39; Brabson, 972, Q. 19; Strine, 1000, Q. 34), and also to similar declarations made by Zimmerman (James Champion, 602). From this it appears there was necessity enough for repairing the ram and putting new iron pipes in in the fall of 1878.

Those of defendants' witnesses who testify to seeing the ram in 1876 and '77 do not describe it as having a stone wall about it, such as Wagner testifies he built in 1878, but some say that there were some loose stones about the hole (Kreidler, D. S. rej. 131, Q. 16; John Kaffenberger, D. S. reb. 955, Q. 36), while others say it was boxed in with planking (Gamber, 742, D. S. reb. Q. 37; Givens, D. S. rej. 126, X. Q. 102; Trafford, D. S. rej. 75, Q. 23). The boxing in of the ram with planking was probably the first and most obvious way suggested to Mr. Kissinger's mind of protecting it. He is a carpenter by trade (C. Vol. 1, 556, Q. 42), and it is only natural that he should have contrived with reference to his knowledge of that craft. The loose stones may have supplemented the boxing that he made. The displacement of the wooden, and probably at that time rotten, protection by the stone wall by the stone-mason, Jesse Wagner, in the fall of '78, was but another part of the improvements made at that time.

Stress is laid by complainants upon the fact as testified to by Wagner that when he went to Kissinger to lay that wall he found a square hole dug and the ground around the hole looking as though the latter was freshly dug. But there is nothing remarkable in this circumstance. If the ram had been there for ten years boxed in by boards, or by boards and loose stone, and it was desired to displace these protections by a neatly and regularly laid stone wall, such as Wagner constructed, the hole would have had to be dug out, squared and trimmed up, and, as the result of this work of preparation, there would of necessity be left evidences of freshly-turned earth about the hole.

Wagner does not pretend to say that anything that was in the way of digging or squaring the hole after he got done there. When he arrived he found the pit all squared and ready for him, and the ram was in it in operation, and he does not know how long it had been there. Even the stones with which he built the wall were lying there waiting for him.

The whole evidence about what transpired at Kissinger's in the fall of '78 indicates plainly that what was done at that time, so far as the whole water-supplying apparatus was concerned, was to simply fix it so that it would work; and to that end the old, rusted, bursted and leaky iron pipes were replaced by the new ones ordered from Philadelphia; the ram itself was taken to Drawbaugh's shop, cleaned, put in order, and brought back by Cyrus, as he testifies; the old curbing to the pit was taken out and a neat and solid wall laid by Wagner, a skilled stonemason, and, to insure the completeness and success of the whole job, Drawbaugh was brought over from Milltown to superintend it, which accounts for his presence at Mr. Kissinger's again.

The complainants, in endeavoring to prove by a half-dozen negative witnesses that the ram was not put in at all prior to November, 1878, ask the court to entirely disregard the clear and unimpeached testimony of scores of defendants' disinterested witnesses, who testify most positively to having seen it there, and the preparations for it at many different times during the two preceding years.

Were the witnesses equal in point of numbers, the testimony of those called by defendants must prevail, according to well-settled rules of law respecting the value of affirmative and negative evidence; but the number of defendants' witnesses testifying to the existence of the ram prior to '78 is so much greater than the number of those who assert the contrary, that there can be no doubt of their preponderating weight.

But not alone by the oral testimony of witnesses is defendants' theory supported. Every book, every letter, every writing of any description that has been produced by either defendants or complainants containing the slightest reference to the ram or the pipes therefor, strongly sustains it. The letter from Mr. Kissinger to Mr. Draper, dated May 30, 1875, (D. S. rej. 169), indicates that prior to that date Mr. Kissinger had been looking about for piping for the ram, and had been told that only iron pipe would do to go from the ram up the hill to the house; the Draper-Kissinger account (D. S. rej. 178) shows that the charge of $60 for the expenses of the ram is entered in the account for 1876, among other items of charge proved to properly belong in that year's account; the letter of Mr. Draper to Mr. Eppler, dated Dec. 18, 1877, (Eppler, C. Vol. 3), speaks of the putting in of the ram as a matter already accomplished, a thing of the past, while the bill for the pipes procured in Philadelphia in July, 1878, shows that new pipes were obtained at that time to replace the old, rusted and worn-out ones first put in. All these writings are in harmony with each other, and in exact accord with defendants' theory.

Can they, too, be mistaken, as complainants contend the forty or fifty witnesses called for defendants are? In the nature of things it is impossible. They were prepared at different times by different persons, and without reference to each other. It is no mere coincidence that they all point in the same direction. They all tend to establish defendants' theory, because the latter is undoubtedly the true one.

It was not until near the close of the taking of testimony in this case that the letter of Mr. Kissinger to Mr. Draper, dated May 30, 1875, containing a reference to the old iron pipe for use in connection with the ram, was discovered by defendants.

A photo-lithograph copy of it is found in Defendants' Exhibits at page 138. It reads as follows:

"May 30, '75.

"MARYSVILL

"MR. DRAPER.

"*Dear Sir*,—i received you Letter about the pipse
"now they sey non will do but iorn pipe to go up hil
"now i can get som god ole pipe here now i want you
"to com up soon we got the pech tres al trimd and lok
"nice what sho you som farmin this year rite sone no
"more

"Yours truly
"GEO KISSINGER."

This letter was accidentally found by Mr. Draper in an old day book at his home in Delaware some time after his wife and daughter had been called to Philadelphia by complainants to give testimony in their behalf (Draper, D. S. rej., 168). Its important bearing upon the ram controversy was, of course, at once appreciated.

It had always been a part of defendants' theory that before the ram was first put in, in 1876, Mr. Kissinger had procured somewhere, probably very cheaply, a lot of old iron piping for use in conveying the water from the ram up the hill to the dwelling-house, and while several of their witnesses, notably Strine (D. S. reb. 1001) and Theo. Fenn (D. S. reb. 781), had testified that the pipes which they saw connected to the ram in 1876–7 were old, rusted and leaky second-hand iron pipes, the amount of evidence in regard to those pipes did not begin to compare with that relating to the wooden piping.

Mr. Draper's recollection is, as we have seen, that when he was up to the farm, in the spring of 1875, he saw the logs that Mr. Kissinger had cut for the ram-pipes; saw the auger that the logs were to be bored with; discussed the feasibility of terra-cotta piping, and agreed to write to Kissinger about the latter on his return home from that trip (D. S. rej., 169). From the fact that Mr. Kissinger's letter speaks of Mr. Draper having written previously about the pipes, it is evident that he did write as he promised, and from the further fact that in the letter Mr. Kissinger states that "now they sey non will do but iorn pipe to go up hil," it is apparent that Mr. Kissinger had, like Mr. Draper, learned that the terra-cotta piping they had discussed would not answer, because it would not stand the pressure.

So important, indeed, did this letter appear to defendants that, fearing its genuineness might be questioned, they thought it prudent to endeavor to get Mr. Kissinger to acknowledge it to be his. Mr. Draper was quite sure the letter was in Mr. Kissinger's handwriting, and the fact that he had found it among his own effects went far to prove its genuineness. Yet since he knew that Mr. Kissinger's handwriting was not always the same, and since so long a time had elapsed since the letter was written, he preferred to leave the matter to Mr. Kissinger (Ibid). Accordingly, Mr. Draper, Mr. W. K. Fenn and Mr. Melville Church went down to Easton with this and a number of other letters, and laid them before Mr. Kissinger. He acknowledged them all to be his, and also admitted that the iron pipes mentioned in the letter of May 30, 1875, were intended for the ram. Draper (D. S. rej. 192, Q. 86; Fenn, Ibid., 217, Q. 10; Church, Ibid., 257).

Afterwards, and as soon as complainants had found out that the whole fabric of their theory had been swept away by this letter and Mr. Kissinger's admission concerning it, they called Mr. Kissinger to the stand, got him to deny having made the admission (C. Vol. 3, 2406, Q. 21), and to gravely swear that the pipes referred to in the letter was not for the ram, but for the purpose of conveying water to the house by gravity from a small spring that came out of the opposite hill up back of the barn at a point higher than the spring which fed the ram; and they got David Cowens and Leonard Swartz, two of defendants' witnesses, whom they had previously tampered with and recalled, as we have seen, to come in and testify that they remembered that at some period of time which they cannot definitely fix it was proposed to take water from that upper spring. Cowens says he "thinks" it was in the year 1875 (C. Vol. 3, 2459, Q. 4), while Swartz says it was "*about* a year after he (Kissinger) moved back the second time" (C. Vol. 3, 2389, Q. 1). Cowens says he heard of the matter on an occasion when he was on the farm, and when Mr. Kissinger and Mr. Draper were both present; while Swartz testifies only to a conversation he had with Mr. Kissinger about what the latter and Mr. Draper had previously discussed (Ibid., 2392, Q. 15). Since neither of them swear positively it was the intention to get the water from this upper spring to the house by gravity, it is possible that when Mr. Draper and Mr. Kissinger were talking about putting in the ram in 1874 and 1875, the upper spring was referred to as a possible source of supply for the ram.

Mr. Draper swears that, to his recollection, no such thing as the gravity project for getting water to the house was ever even talked about (D. S. rej. 203), and it is apparent that it could never have been previously considered, since all admit the spring itself was a poor one, and only ran a part of the year (Draper, D. S. rej. 203, Q. 144; Cowens, C. Vol. 3, 2459, Q. 3).

Mr. Draper does say, however, that when the stone house was built, in 1867, he talked some of trying to open up the upper spring farther up the hill, and of laying a pipe from it to a trough in the barn-yard *on the same hill*, so that the stock might be watered more conveniently and their manure saved (D. S. rej. 203, Q. 145); and this was the only use to which the upper spring was ever thought of being put.

But it needs not Mr. Draper nor any other living witness to contradict Mr. Kissinger's story about what the pipes referred to in the letter were intended to be used for. The letter itself is sufficient. It says that "none will do but iron pipe *to go up hill.*"

This implies that other kinds of pipe could be used in a different place, as, for example, between the spring and the ram, but that only iron pipes would serve to go up hill. If other pipes than those intended for going up the hill had not been in Mr. Kissinger's mind, and previously discussed with Mr. Draper, it would have sufficed, and been more natural for him, to have simply stated "that none will do but iron pipe," without any reference at all to the hill.

Again, if the bringing of water from the upper spring were in contemplation, there would have been the same necessity for using iron pipe down one hill from the spring as up the other hill to the house, as the pressure in the pipes on both hills would have been the same. But nothing whatever is said of two hills nor of the use of iron pipes *down a hill.*

Mr. Kissinger's explanation of this letter is just about as satisfactory as that which he offers in regard to the entry of the $60 for the cost of the ram in the Draper-Kissinger account of 1876, and when it is contrasted with his admission to the exact contrary, as testified to by Messrs. Draper, Fenn, and Church, and with the conclusive testimony of Mr. Draper on the subject, we think the court will give it no weight whatever, but, on the contrary, will regard the letter as but another strong corroboration of defendant's theory, and a complete confirmation of Mr. Draper's testimony in regard to the ordering of the ram in 1874. And this conclusion will be further justified when it is borne in mind that the testimony shows that Mr. Kissinger did, subsequently to the date of the letter, get old iron pipes for the ram and put them in in connection with the ram, while, as he in cross-examination is forced to admit, he never procured or contracted for a bit of piping of any kind for conveying the water from the upper spring, nor did he ever dig a trench, deepen the spring, or, in fact, do a single stroke of work towards bringing the water by pipes from that upper spring towards the house or anywhere else (Kissinger, C. Vol. 3, p. 2447, X Q. 319-326).

This attempt on the part of the complainants to thus connect the iron pipes referred to in the letter with the bringing of a supply of water from the upper spring, after fully fifteen hundred printed pages of testimony had been taken, covering almost every conceivable feature of the water supply on the Draper farm, without a single word having been said about an upper spring, or the slightest reference of any kind having been made to it, is so weak and transparent as to impress one with nothing but the idea that in their extremity they are catching at straws. Its sublime audacity, however, perhaps eclipses anything else they have attempted in the whole case. Mr. Kissinger was not the originator of it. It was far too deep and ingenious for him, and was planned by an abler mind. We cannot perhaps point out the precise individual to whom the credit (?) of its conception is to be attributed, but this we do know, that nearly a month prior to defendants' first knowledge of it the contents of the particular letter in question were made known to complainants' agents and counsel, at Philadelphia, by Mr. Draper's younger son, John B. Draper (D. S. rej. 251), who had had previous instructions from Mr. Comfort to inform him of any newly-discovered evidence (D. S. rej. 252), and hence quite a sufficient time elapsed, before defendants knew anything about it, to enable the "upper spring" business to be set in motion, and to enable complainants' agents to again operate upon Kissinger, Cowens, and Swartz, and work them up to the proper frame of mind for testifying about it, so as, if possible, to be prepared to break the force of the letter when it should turn up, as they knew it ultimately must.

Kissinger, Cowens, and Swartz were all at Philadelphia after young John Draper had been there and told about the finding of the letter. Mr. Kissinger was not examined then on any subject, and though Mr. Cowens and Mr. Swartz were examined at that time upon other subjects (C. Vol. 3) nothing was asked them about the upper spring. Why were they not all examined about it? Because there lingered in complainants' breasts the hope that the letter, which up to that time had not been seen by defendants, might yet be lost, destroyed, or perhaps get into their own possession, and never come to light.

There was ample opportunity for "preparing" Kissinger, Cowens, and Swartz.

Mr. Kissinger was brought to Philadelphia to see Mr. Cowens (C. Vol. 3, 2441), and Mr. Cowens and Mr. Kissinger were both together sent down to Easton to see Mr. Swartz (C. Vol. 3, p. 2464.) Though it was out of Mr. Cowens' way to go to Easton, he explains why he went, as follows: "*Mr. Brooks* (complainants' agent) *said that if I wanted to go around that way he'd pay my way; it would cost a little more to go around that way, but if I wanted to go and see Swartz, he wouldn't mind having me go that way*" (Cowen, C. Vol. 3, p. 2464, X. A. 32.)

Neither the additional expenses of the trip nor the amount of time consumed, and to be paid for, weighed with complainants, however, though the former were considerable, and for the latter the witness was paid five dollars a day (Ibid, 2466, X. Q. 47).

It was doubtless a part of the programme to have Mr. Kissinger deny the genuineness of his letter, and had not Mr. Draper himself confronted him with it he would probably not have admitted it to be his. Even after his written acknowledgment of it had been made, it would seem from the rigor with which Mr. W. K. Fenn (D. S. rej., 215) was cross examined when called to prove Mr. Kissinger's signature to the letter, that complainants were still inclined to attack the genuineness of both the letter and of the acknowledgment; but finding the proof of the signature to the letter so fully made out, they shifted their ground, and concluded to call Mr. Kissinger, and have him admit the letter, but deny that the pipes referred to in it were for the ram.

More upon the subject of this letter we will not say, except to ask the court to carefully compare the testimony of Mr. Draper with that of Mr. Kissinger about the purpose of the pipes referred to in the letter, and to compare the testimony of the three gentlemen—Mr. Draper, Mr. Fenn and Mr. Church—with that of Mr. Kissinger concerning the latter's admission as to what those pipes were really intended for, feeling satisfied that the statements of Mr. Kissinger, by reason, as well of their loose and contradictory character, as of the previously admitted perjury of their author on other subjects, will not be allowed to prevail.

APPENDIX B.

THE FLOOD AND BRIDGE CONTROVERSY.

Another collateral controversy arose in this case, namely, with regard to the flood of August, 1873, and the carrying away of bridges along the Yellow Breeches Creek. Its origin was as follows:

E. B. Hoffman (D. Vol. 1, p. 481; recalled *Id.*, p. 660), a witness called by defendants, testified, among other things, as follows: That in 1873 there was a freshet along the Yellow Breeches Creek in the latter part of the summer—the exact time he could not remember—which "washed away a foot-bridge at a mill known as Ditler's Mill at that time, and also the Red Bridge up at Heck's;" that he was along the creek at that time for four days, fishing for fish and turtle; that during those four days he was at Drawbaugh's shop once or twice, and then and there saw talking machines. He identified "Exhibit I" as one that he saw there at that time. (Ans. 9-13.)

The rest of his testimony related to other visits and other talking machines.

In contradiction of him, complainants called Samuel M. Emminger (C, Vol. 1, 928), Clerk of the County Commissioners of Cumberland County, who testified that there was no such bridge along Yellow Breeches Creek as the Red Bridge at Heck's; that at the date of his deposition there was no mill in the county known as Ditlow's or Ditler's Mill. (Ans. 6.) He fixes the fact, however, which has been conceded on both sides, in the subsequent stages of the case, that the Ditler's Mill referred to by the witness Hoffman could have been no other than a mill near which several families named Ditlow lived in 1873, and had lived for many years (see Danner D. S.-reb. 405, Ans. 18 and 20, 407, Ans. 40 and 408, Ans. 48 and 49; Mrs. McCleaf, *Id.* 445, Ans. 3-6 and 31-34; J. Ditlow, C, Vol. 1, 959, Ans. 4-6; George Ditlow, *Id.* 2123, Ans.

3–5; J. Evans, *Id.* 975, Ans. 15–17), and which is now owned by Etter and Shanklin, known by the name of Etter and Shanklin's Mill, and is situated a short distance below Milltown. (Ans. 8.)

A very ingenious attempt was made by complainants, by means of this witness, to make it appear to the court that the foot-bridge at Etter and Shanklin's Mill was not carried away by the freshet of 1873. The witness was a clerk to the County Commissioners, and produced and read as a part of his deposition a statement which he claimed to have written out from the records of the county, and which was ostensibly a full account of the damage done to, rebuilding and repairs of, all the bridges across the Yellow Breeches Creek from its mouth to a point twenty miles (by stream) above Eberly's Mills, from 1860 down to the date of his deposition.

In it he set forth (Ans. 6) that the foot-bridge at Etter and Shanklin's Mill "was carried away by the ice and high water in the spring of 1875. Not long afterwards a petition was filed in the Court of Cumberland County for a wagon bridge at that place. The bridge was not built, and the foot-bridge was rebuilt in the winter of 1877–8, when the foot-bridge at Liberty Forge, which was removed on account of the new wagon bridge, was carried to Etter and Shanklin's Mill and put up. That bridge is still standing."

The statement contained no allusion to any other time when the Etter and Shanklin foot-bridge was either destroyed or damaged, rebuilt or repaired. He testified that the petition spoken of in his statement was "started" soon after the foot-bridge was carried away, and was presented to the court at the August sessions of the same year. A certified copy of said petition was produced and spread upon the record as a part of his deposition, which showed that the petition was filed August 23, 1875, and viewers were appointed by the Court August 25, 1875.

The inference naturally to be drawn from this testimony, and the one which undoubtedly complainants intended the court to draw, was that the foot-bridge referred to was not washed away, rebuilt or repaired at any other time than that stated. Upon cross-examination, however, the witness admitted that the county had nothing to do with it, and that the records in his office related only to county bridges (*i. e.*, large wagon bridges too expensive for townships to build or keep in repair), and did not show anything with regard to township bridges; and further (Ans. 36), that "the county does not build foot-bridges; they are built by the township or by the citizens of the localities where they are erected."

Complainants followed up this testimony by calling Jacob Evans (C. Vol. 1, p. 974), who testified that he began to work at Etter & Shanklin's mill on the 1st of November, 1874 (Ans. 15), and worked there until some time in September, 1875, when he moved away (Ans. 19); that during the winter he worked there (1874-75) the foot-bridge was taken away by high water and ice. (Ans. 20.)

To meet the inferences which complainants undoubtedly intended to draw from this testimony, and to demonstrate that the witness Hoffman was correct in the date which he fixed, as well as to show to the Court the flagrancy of this attempt to make the truth appear a lie, and to furnish another illustration of the peculiar methods pursued by the complainants in attempting to answer defendant's proofs, defendants called a large number of witnesses.

It must be here remarked, that in order to relieve complainants of suspicion of having acted in bad faith with the Court, and boldly attempted to practice deceit upon it, it is necessary to assume their entire ignorance of the law respecting the re-building and repairing of foot-bridges—ignorance which would have been dispelled by inquiry of any intelligent citizen of any of the rural districts of Pennsylvania. And, moreover, however ignorant complainant's counsel may themselves have been on the subject, it is clear that their chosen confidential agent and procurer of evidence, John C. Comfort, could not have been so, inasmuch as he resided in Lower Allen township, as appears by the evidence, and on the very banks of the Yellow Breeches Creek (see map in complainant's book of exhibits), and is shown to have hauled timber under Supervisor Weaver (C, Vol. 3, p. 1920), for the repair of one of the foot-bridges across said creek; and to have held office at one time in said township (D, Vol. 1. 315). Furthermore, the duty of the township supervisors to repair foot-bridges was subsequently proved by complainants, when in their rejoinder it became necessary for them to shift their ground. (D. Smith, C, Vol. 3, 1895–6, Ans. 9–11, *et passim*; Bilner, *id.*, 1929–30, Ans 3, *et passim;* Eshelman, *id.*, 1943, Ans. 5.) The same appears by numerous other witnesses called by both complainants and respondents. It also appears that a territorial division of the work on roads and bridges, in Lower Allen township, Cumberland county, is made between the two supervisors, the districts being known as the "upper" and "lower" "ends." (D. Weaver, *ut supra;* Bitner, *id.;* Eschelman, *id.:* H. S. Rupp; D. S rej., 228, *et seq.*, and others.)

A few words are necessary with regard to the *locus in quo.* The Yellow Breeches Creek, the course of which is exceedingly tortuous for a considerable distance, forms the boundary line between Cumberland and York Counties, Pennsylvania, and empties into the Susquehanna River at New Cumberland, a few miles below Eberly's Mills. On its northern bank, at the mouth of Cedar Run, stands the shop of Daniel Drawbaugh. The creek is crossed by numerious wagon and foot bridges, the character and location of which are stated with substantial accuracy by complainant's witness, Emminger (C. Vol. 1, 930–1, Ans. 6). Of the wagon bridges it is unnecessary to speak. Of the foot-bridges we have to do with five, which in 1873 connected Lower Allen township, Cumberland County, with Fairview township, York County, in the following order, beginning with the lowest down: First, that at Etter & Shanklin's mill, ¼ (Maglaughlin, D. S.-reb., 741, Ans. 11) to ½ (Emminger, *ut supra*) of a mile below Eberly's Mills. Second, Zinn's clover mill, about four miles by road and eight by stream, above the same place (Emminger, *ut supra*). Third, Zinn's fulling mill. Fourth, Liberty Forge. All of these were below the town of Lisburn, which stands on the Cumberland bank of the creek about six miles by road, and, probably, over twice as far by stream above Eberly's Mills; and, fifth, the Andersontown crossing.

The map of the vicinity of Eberly's Mill, contained in complainants' book of exhibits, shows the course of the creek from Zinn's clover mill to its mouth. It appears throughout the testimony that the clover mill, fulling mill, forge and Andersontown foot-bridges were included in the "upper end" (of supervisors' district) of Lower Allen township, Cumberland County, and that the Etter and Shanklin foot-bridge was in the "lower end." A similar division, both of territory and foot-bridges, was made in Fairview township, York County.

THE FLOOD OF AUGUST, 1873.

If there is one thing in this case established more unquestionably and overwhelmingly than all others, it is that there was a freshet or flood along the Yellow Breeches Creek in August, 1873. The contemporaneous newspaper accounts (D. S.-reb., 348–360) show that during the week preceding Monday, August 18, extraordinarily heavy rains prevailed throughout the entire Middle States, swelling the streams, sweeping away bridges and railroad tracks, and causing landslides, destruction of crops and general devastation. In the neighborhood of Harrisburg (about two miles from the mouth of the Yellow Breeches) the rain was unprecedented. The *Daily Telegraph* of that city of Friday evening, August 15th, contains the following:

"*High Water.*

The late heavy rains have swollen the mountain streams much beyond their usual limits, and considerable damage has been sustained by those living in the low lands. The Yellow Breeches, Conodoguinet (also a Cumberland county stream), and other creeks have been on the rampage for the last forty-eight hours, sweeping away fences and bridges, and filling the Susquehanna with floating debris and driftwood. We learn that some injury has been sustained by the lower dam of Mosser and Shoop, at the mouth of the Yellow Breeches, but the exact extent of the injury we have not yet been able to learn. The Susquehanna is about 12 feet above low water mark and is still rising."

And of Monday evening, August 18th, the following:

"*The Rain.*

Six and a quarter inches of rain fell in this city between Monday of last week and noon to-day; this quantity is unprecedented for so short a time, as the average yearly fall is from eleven to twelve inches."

However, the proof that the effects of these violent rain storms extended to the Yellow Breeches Creek and caused a heavy rise in it, does not rest upon mere newspaper reports, but upon the positive testimony of upwards of thirty witnesses called by the defendants in rebuttal. Into the details of their testimony it is unnecessary to enter, in view of the admission of the complainants. It is sufficient to point out that the flood was a very extraordinary one for that creek. Charles I. Boyer testifies that he took charge of Liberty Forge, on the banks of that creek, in 1872, and was there from that time to the date of his deposition (November 7, 1883), with the exception of less than a year (April, 1877, to February, 1878), and that during that time the water in the creek was never so high to his knowledge as it was in August, 1873 (D. S-reb. 206, Ans. 2, 31 and 35–36). Samuel M. Deckman testifies that the creek has never been as high as in August, 1873, since he moved to it in March, 1873 (*Id.* 248, Ans. 9–11); Jacob Kunkel, since he moved there in 1868 (*Id.* 252, Ans. 2); John F. Wire, for eighteen years (*Id.* 274, Ans. 18–20); Barbara Ann Wire, since she was married, in 1868 (*Id.* 278, Ans. 16–17); John Sprenkell, that he has lived within sight of the creek since 1851 or 1852 (*Id.* 281, Ans. 2), and that, except the flood of 1863, the watermelon flood (1873) has been the greatest flood in that time (Ans. 4–8); Isaac Gray, that the flood of August, 1873, was the highest, so far as he can recollect, in thirty-two years, during which time he has lived along the creek. Besides the extraordinary character of it, another fact serves to impress the flood of August, 1873, upon the memory of many of the witnesses, namely, that its rising waters swept away a large number of watermelons from the patch belonging to George S. Sipe and John F. Wire on "Kunkel's Island," on the Yellow Breeches Creek, at Lisburn (Boyer, *Id.* 207, Ans. 22; Deckman, *Id.* 248, Ans. 12, 13, and 20, 21; Kunkel, *Id.* 252, Ans. 3–12; Sipe, *Id.* 267, Ans. 5–12; Mrs. Sipe, *Id.* 272, Ans. 11, 12; Wire, *Id.* 274, Ans. 8–13; Mrs. Wire, *Id.* 278, Ans. 9–14; Atticks, *Id.* 300, Ans. 6, 7; Gher, *Id.* 318, Ans. 8–27; Grissinger, *Id.* 388, Ans. 7, 11, 15, 16;

Hart, *Id.* 394, Ans. 13–17, and many others). These melons were seen and caught at various points along the creek (Boyer, *Id.* 211, Ans. 51; Deckman, *Id.* 248, Ans. 12; Kunkel, *Id.* 253, Ans. 12; Martin, *Id.* 308, Ans. 8–11; Grissinger, *Id.* 388, Ans. 11; Hart, *Id.* 394, Ans. 13, and others), and gave to the flood the name of "the watermelon flood." (Boyer, *Id.* 211, Ans. 47–50; Kunkel, *Id.* 253, Ans. 4, 5; Atticks, *Id.* 300, Ans. 1; Martin, *Id.* 308, Ans. 5, 6, and others.)

In the face of this great array of evidence, complainants were forced, upon the record, to "formally admit that there was a flood along the Yellow Breeches Creek in August, 1873, and that that flood carried away some of Sipe and Wire's watermelons" (C. Vol. 3, top of p. 1925); not, however, until additional evidence had been drawn on cross-examination from their own witnesses in rejoinder (D. Smith, C. Vol. 3, 1901, Ans. 46–51, and 1904, Ans. 64–71; D. Weaver, *Id.* 1924, Ans. 48–50).

THE ETTER AND SHANKLIN FOOT-BRIDGE.

The witness Hoffman testifies that the foot-bridge at Ditler's, or, which we have seen to be the same, Etter and Shanklin's Mill, was washed away by the freshet of 1873, but does not say how much of it.

David Spangler, who lived from April, 1873, to April, 1875, upon what is known as the Studebaker farm (D. Spangler, D. S.-reb. 425, Ans. 1–6 and 21–23; H. Miller, *Id.* 441, Ans. 2–11; Mrs. E. Spangler, *Id.* 452, Ans. 2–5; D. Spangler, Jr., *Id.* 454, Ans. 2–3), which lay along the Yellow Breeches on the York County side, at the Etter and Shanklin foot-bridge, the farm building being close to the bridge (D. Spangler, Ans. 6), and the dwelling-house only about two hundred yards from it (H. Miller, Ans. 12), testifies that while he lived there said bridge was twice damaged—once entirely swept away—in February, 1875, and at another time partially carried away, the latter occasion being "*in the after part of the summer—after harvest*" (which in that neighborhood occurs in July)—when the York County end was carried away (Ans. 8–10). He further explains that the end referred to was the inclined platform (Ans. 18–21), which rested partly on land and partly on trestles. (*Id.* and H. Miller, *Id.*

443, Ans. 21; D. Spangler, Jr., *Id.* 454, Ans. 20, and others.)

Henry Miller, who lived with Spangler during the entire two years he was at the Studebaker farm, testifies to the same effect (*Id.* 442, Ans. 15-24), and further, that the York County end, the length of which, according to his recollection, was about sixty feet (Ans. 20), was carried away *by a flood*, which occurred in August, 1873, and that when the bridge was carried away in February, 1875, the damage was done *by ice*.

Mrs. Elizabeth Spangler, who lived in his family from May or June, 1873, to March 4, 1875, and who was married to his son, D. Spangler, Jr., in October, 1874, testifies that the platform at the York County end was carried away *by water* in 1873—"in the fall, some time—some time after harvest; I could not tell you the exact time;"—and the whole bridge by ice in the spring of 1875. "It was some time that spring, before I had moved away" (Ans. 6-9). She further testifies that she had occasion to cross that foot-bridge frequently (Ans. 10), and that Mr. Spangler replaced the lost platform a few days after it was carried away by a temporary plank walk. (Ans. 11-13.)

Her husband, David Spangler, Jr., testifies that he lived with his father on the Studebaker farm from the time the latter moved there, in April, 1873, until the beginning of March, 1875, moving away with his wife about a month before his father did; that during that time the Etter and Shanklin foot-bridge was twice damaged, first, "in the fall of 1873, by water," *Id.* 455 (Ans. 14). "It was some time in August (Ans. 15) when the York County end, which, according to his recollection, was about 50 feet in length (Ans. 19), was swept away, and the Cumberland end swung around" (Ans. 16-18). And afterwards in February, 1875, by ice (Ans. 24) entirely carried away.

Amos Zimmerman, who lived along the creek on the next farm below the Studebaker farm, testifies that York County end or platform of the Etter and Shanklin bridge was torn away by *high water*, in the middle of August, 1873 (*Id.* 450 Ans. 8-14), and that the bridge was subsequently carried away *by ice* in 1875, about the latter part of February. (Ans. 15-16.)

There certainly can be no pretense that these witnesses have confounded the ice flood of February, 1875, with the freshet or flood of August, 1873. They remember both, and distinguish accurately between them, both as to the character of the floods and the damage done to the bridge by them.

Mrs. Annie McCleaf, whose maiden name was Ditlow, and who lived close by Etter & Shanklin's Mill up to the spring of 1875, testifies that a flood in August, 1873, "took a part of the bridge away, to the first pier on the York County side." (*Id.* 446, ans. 12–15.)

Several other witnesses testified from their own personal observation that the Etter & Shanklin bridge was gone in August, 1873, to wit: Danner (*Id.* 402) and Solomon Zimmerman (*Id.* 421), but as their recollection seems to be at fault with regard to the extent of the damage, we do not think it proper to rely upon them. Although they testify clearly enough as to the fact that the bridge was carried away in August, 1873, yet they have probably confounded the extent of the damage done at that time with the damage done at some other time,—probably in 1875.

That the bridge was carried away in August, 1873, was a well-known fact in the community, and a number of witnesses testify that they heard it talked about at that time. (Samuel M. Deckman *Id.* 249, Ans. 17 and 30–33; Mrs. Ellen Shaffer, *Id.* 295, Ans. 13 and 31; Atticks, *Id.* 301, Ans. 11, 12; Snell, *Id.* 415, Ans. 31, 32; Grissinger, *Id.* 388, Ans. 14; W. W. Hart, *Id.* 395, Ans. 18–20; Anderson, *Id.* 535, ans. 13.)

William W. Hart worked as farm-hand for Jeremiah Grissinger during the year 1873 (Grisinger, *Id.* 387, Ans. 5–7; Hart, *Id.* 394, ans. 5–7), and at the time of the watermelon flood (Grissinger, Ans. 8–12; Hart, Ans. 13), which Hart fixes as in August, 1873 (Ans. 9 and 20), they went together to the Yellow Breeches Creek, to a point about a mile below Etter & Shanklin's Mill, and whilst there saw a part of a foot-bridge floating down the creek (Grissinger Ans. 11; Hart, Ans. 13). Grissinger says it was about one-third of a foot-bridge. (Ans. 17.)

Henry Anderson testifies that a part of a foot-bridge came down the creek on the August, 1873, flood—the date of which he fixes by book entries—and lodged on his bottom land (*Id.*, 535, Ans. 11), on the York County side, about a mile above New Cumberland (Ans. 4); and that "Charles Sweeney, the supervisor, came to me and told me that it was a part of a foot-bridge that had been swept away up around Milltown, or in there somewhere, and he would take it away, or would have to take it away, to fix the bridge up with." (Ans. 13.)

The Etter and Shanklin foot-bridge was the only foot-bridge across the Yellow Breeches Creek in Sweeney's district, inasmuch as there were none below it (see Emminger, Ans. 6), and the next above, at Zinn's clover mill, was in the district of Adam Baker. (D. Smith, C. Vol. 3, 1896, Ans. 11; D. Weaver, *Id.*, 1919, Ans. 10, 11.) That Charles Sweeney and Adam Baker were supervisors of Fairview township in 1873 (see *Id.*, *p.* 2080), and that Sweeney is now dead. (See statement of complainants' counsel, *Id.*, *p.* 2081.)

Henry S. Magonell testifies that he helped Charles Sweeney, the supervisor, to repair the Etter and Shanklin foot-bridge in September or October, 1873 (D. S.-reb, 964, Ans. 2-10) that the part of the bridge repairkd was the York County end, about fifty-five or sixty feet long, which had been carried away by high water in August, 1873 (Ans. 12-16); that witness was married November 3, 1873 (Ans. 6), and the repairing was done just before that event occurred (Ans. 5), and when fall wheat was very nicely up (Ans. 22); and that, with the exception of a few new boards, they used old lumber—or stems and boards—which had been in the bridge before (Ans. 17-21); and, further, that a temporary plank platform had been put up before the repairing was done. (Ans. 47.)

He is corroborated by George W. Atticks, who testifies (*id.*, 302, ans. 12) as follows: "Charles Sweeney was supervisor that year (1873) of our township, or rather that end of it which the bridge belonged to. In the fall, I think it was in November, he asked me to help put up this bridge at Etter and Shanklin's"; and by David Spangler, Jr., who testifies that the bridge was repaired "between the time it was swept away and the holidays." (*Id.*, p. 455, Ans. 21.)

Moreover, not only did defendants show that a part of the Etter and Shanklin foot-bridge was carried away by the flood of August, 1873, but they proved by persons who were present with him, that E. B. Hoffman was present at the foot-bridge at the time when the accident happened.

William J. Maglaughlin testifies that in August, 1873, he, his son Jacob J. Maglaughlin (Ans. 15, 16), and E. B. Hoffman went together on a fishing expedition along the Yellow Breeches Creek (*id.*, 751, Ans. 1-7) to catch fish and turtles (752, Ans. 18); that they encamped along the Yellow Breeches Creek opposite the Studebaker farm, and just below the Etter and Shanklin Mill (Ans. 10), from Monday dinner-time until Friday morning (Ans. 17), during which time the creek rose very high. "It rose high enough to bring down all the wood and stuff that was lying along the creek; it fetched down one foot-bridge that I seen, and part of another." (Ans. 9.) "There was a big tree and a foot-bridge coming down over the dam, and *we could see them from where we were encamped.* I think it was striking the foot-bridge at Shanklin's Mill that caused one-half of that to go, because it went just after it was under it. I can't tell what foot-bridge the other was, as I can't tell where it came from, but it came down the creek." (Ans. 12.) "Q. 13. What part of the foot-bridge at Etter and Shanklin's Mill, or Shanklin's Mill, as you call it, was carried away at that time? Ans. It was the half on the left hand side of the creek going up, on the York county side—right at the Studebaker farm." He further testifies that he never went up the creek with Hoffman at any other time, as it was very seldom that the latter could get off. (Ans. 31.)

Jacob J. McLaughlin (*id.* 763) fully corroborates his father. He testifies to the fishing expedition along the Yellow Breeches Creek with Hoffman in 1873, and although he cannot name the month, he fixes the time time with sufficient definiteness by the fact that the corn was in roasting ears at the time (*id.* 765, Ans. 18). He testifies that the party encamped just below the flouring mill and the foot-bridge (Ans. 11), and that he saw "part of the foot-bridge that was right below the flour mill taken away by part of another foot-bridge that came down from some place" (Ans. 16). He further testifies that he never went fishing on the Yellow Breeches after 1873. (Ans. 24.)

To this testimony with regard to the carrying away and repairing of the Etter and Shanklin foot-bridge, the complainants attempted no reply beyond a superficial attack upon a statement made by one of defendant's witnesses, Amos Zimmerman, with regard to the time when the repairs were made.

But we are not quite done with the testimony of William J. Maglaughlin. He further testifies that whilst he and Hoffman were thus encamped at Etter and Shanklin's mill, they went together to Drawbaugh's shop to get a net with which to catch bait fish (*id.* 752, Ans. 19–22), and that Drawbaugh then and there showed them and talked to them through his talking machines (Ans. 22–25), and the witness identifies "Exhibit I," as one of the instruments which he saw there at that time. (Ans. 26.)

Thus, then, the defendants proved: 1st, that there was a flood or freshet along the Yellow Breeches Creek, on August 18, '73; 2d, that the witness, Hoffman, was there at the time; 3d, that the foot-bridge (or at least a part of it) at Etter and Shanklin's (or Ditler's) mill was washed away by said flood; as was, 4th, another bridge; 5th, that Hoffman was at Daniel Drawbaugh's shop, and saw talking machines there, at the time of said flood, and 6th, among which was "Exhibit I."

This was certainly as complete and satisfactory a vindication of the accuracy of the memory of Hoffman as could be desired. But we have not yet exhausted defendant's proofs.

OTHER BRIDGES.

It may be admitted that Hoffman was in error in regard to the "red bridge up at Heck's." But it must be noted that he does not pretend to have any personal knowledge of the carrying away of any such bridge. He merely states that his visit to Drawbaugh's shop was at the time of a freshet, which carried away said bridge, without, however, claiming to have been present *when* it was carried away, or to have been at its former site *after-*

wards, or, indeed, to have any personal knowledge of its location. The very fact of his having called the Etter and Shanklin mill by a name by which it was *not* commonly known, as he supposed, demonstrates his unfamiliarity with the names of localities along the creek. The flood was an extraordinary one, and great damage was done by it; bridges were swept away to his personal knowledge; several bridges above Etter and Shanklin's were reported to have been carried away, and were actually carried away, as will appear further on. These reports Hoffman may have heard at the time, and in what exaggerated form it is impossible to tell. So that it is easy to see how he may have been wrong with regard to the "red bridge up at Heck's," without detracting anything from the general accuracy of his memory or the honesty of his testimony.

We will now discuss as briefly as possible the testimony in the case bearing on the carrying away of bridges above Etter and Shanklin's mill.

1, *The Andersontown Foot-bridge.* — The foot-bridge highest up the creek, with which we have to do, at the Andersontown fording was in 1873, about three-quarters of a mile above Lisburn. (J. F. Wire, D. S.-reb. 277, Ans. 53.)

Mrs. Barbara Ann Wire testifies that a couple of days after the flood which carried away the watermelons belonging to her husband and George S. Sipe (*id.* 279, Ans. 22), and which she fixes as in August, 1873 (Ans. 7–13), she started to visit some friends living at Siddonstown (Ans. 31–34), and when she went down to the creek to cross "the bridge above Lisburn, toward Andersontown," it was gone. (Ans. 20-21.)

John F. Wire testifies that the flood of August, 1873, which took away his watermelons, also carried away the foot-bridge at the Andersontown fording, above Lisburn (*id.* 275, Ans. 22–24). He does not state his means of knowledge, but it is highly probable that he had personal knowledge of it, as the bridge was only "about half a mile" from his house. (Ans. 54). George W. Atticks corroborates. (*Id.* 301, Ans. 11.)

This bridge could not have been carried away later than 1873, as in that year a wagon-bridge was built to replace it (Emminger, C. Vol. 1, 931; Atticks, D. S.-reb., 304, Ans. 32); and it is submitted as highly probable, although there is no evidence in the case bearing direct on the point, that the wagon-bridge was built in that year *because* the foot-bridge had been washed away, the attention of those residing in the vicinity of the bridge being thus drawn afresh to the need of a substantial and permanent crossing at that point, just as the carrying away of the Etter and Shanklin's foot-bridge by the ice flood of 1875 led to the circulation among the neighhors and the presentation to the court of a petition asking for a county bridge at that point.

The testimony of the defendants with regard to the carrying away of the Andersontown foot-bridge in August, 1873, is entirely uncontradicted, the general denial of the Supervisor, Bitner, being rendered inapplicable to it by the fact of the building of the county bridge with which he had nothing to do in the same year.

2. *Liberty Forge Foot-bridge.* The next foot-bridge, down the creek, in 1873, was that at Liberty Forge. The testimony regarding it was as follows:

George W. Atticks, referring to the watermelon flood of 1873, which he had special reason to remember, and the date of which he fixes with great positiveness and accuracy (D. S.-reb., 300. Ans. 1-8), testifies (Ans. 10), "yes, sir, it did take away foot-bridges; it carried away the clover mill, the fulling mill, and the forge foot-bridges to my own knowledge—my own sight—meaning that I seen them after they were carried away. I didn't see the water carrying them away; I seen the places where they were, rather."

To contradict this testimony, complainants called two witnesses:

(*a*) Charles I. Boyer, who is unwilling to say positively that the flood of August, 1873, did not carry away the forge foot-bridge, but testifies merely, "I think it did not" (C. Vol. 3, 1942, Ans. 3). Whether this is evidence at all seems at least very doubtful, but certainly no probative force can attach to it when opposed to the testimony of a witness who swears to his own positive knowledge.

(*b*) Jacob E. Mumma, who testified that he lived for seven years, beginning April, 1873, at the Liberty Forge, being one of its proprietors, and that during that time the foot-bridge there was carried away only once, to wit: in 1877. (C. Vol. 3, 2001, Ans. 1, 9.) But his testimony is rendered worthless, as he goes to pieces on cross-examination, both as to dates and events. He fails entirely to remember that there was a flood in August, 1873 (Ans. 21), or the watermelon flood (Ans. 46), or that Sipe and Wise's watermelons were ever carried away by any flood (Ans. 49-51), or that there ever was an ice flood along the creek whilst he lived at the forge (Ans. 52). These were facts well known in his neighborhood, and testified to by both defendants' and complainants' witnesses, and that he should not remember them demonstrates untrustworthiness of his memory. He testifies, however, that he does remember a flood in 1873, which he has reason to remember was "before harvest—in the fore part of the summer" (Ans. 10-18, 21, 22); he does not remember that it did any damage along the creek, and it did not do any at the forge (Ans. 18). He admits that there may have been another flood that year, but does not recollect it (Ans. 23). He does not appear to have been in the habit of crossing the creek at the forge foot-bridge (Ans. 33-44), his post-office being at Lisburn (on the same side of the creek as that on which he lived), where also he purchased his household supplies (Ans. 37-39); and when he had occasion to drive across the creek, he usually crossed at Lisburn by the wagon-bridge. (Ans. 41-44.)

4. *Zinn's Fulling Mill foot-bridge.*

George S. Sipe testifies that a couple of days after the flood which carried away his watermelons (D. S.-reb. 268, Ans. 18) which he fixes as a week or ten days after he quit work at the forge (Ans. 6-7). He quit August 5, 1873. (See Boyer *Id.* 207, Ans. 13 and entry on Boyer's time book *Id.* 210): that he had an errand down the creek and went to Zinn's falling mill, intending to cross the creek by the foot-bridge, but could not do as the bridge was gone (Ans. 15-18), and he was compelled to cross by wading "right at the place where the bridge had left—at the fulling mill" (Ans. 41, 42). That this must have occurred in warm weather is reasonably certain, and that it could not have occurred after 1873 is

Third—That David Smith, who is not shown to have any special means of knowledge, does not remember that the bridge was carried away in 1873. (*Id.*, 1899, Ans. 35.)

No further contradiction or impeachment of defendants' witnesses with regard to this bridge was attempted, except by the general statement of Henry M. Bitner with regard to all of the bridges in the "Upper End" of Lower Allen township, which statement will be discussed hereafter.

4. *Zinn's Clover Mill Foot-bridge.*—By far the greatest amount of testimony taken respecting the bridges related to this foot-bridge, which was the next above Eberly's Mills and the Etter and Shanklin mill. We will find it most convenient to consider this testimony in the following order, namely: testimony of (*a*) defendants on sur-rebuttal, (*b*) complainants in rejoinder, and (*c*) of defendants in sur-rejoinder,—first premising a few explanations with regard to the location of the bridge and the residences of some of the witnesses.

On the map of the vicinity of Eberly's mills, contained in complainants' book of exhibits, Zinn's clover mill appears. It is the building marked "Clover Mill," highest up the creek shown on said map, and stands on the west bank of the same, near several buildings marked "A Zinn."

The foot-bridge is not shown on the map, but it stood in 1873 and stands to-day a very short distance below the clover mill, and between the road which appears to cross the creek and the road which does *not appear* to, but in point of fact *does*, cross the creek.

Following the course of the stream, these houses appear on the Cumberland bank, namely: First, A. Zinn, occupied in 1873 by Adam Henry Zinn (Hess, D. S-rej., 61, Ans. 41). Second, Dr. Whitman, occupied in 1873 by Samuel M. Deckman (*Id.*, Ans. 40, and Deckman, *Id.*, 83, Ans. 37). Third, "E. Worley," occupied in the same year by Ezekiel Worley, opposite which is a point in the creek known as "Worley's Ripples" (Deckman, *Id.*, 17, Ans. 80). Below Worley's and around the bend of the stream on the York County bank, at the point where the road crosses the creek, by a bridge, is Miller's mill, at which, during the summer of 1873, lived Samuel C. Weber (Weber, *Id.*, 148, Ans. 1–3). Still farther down, but on the Cumberland County bank, is the house of John C. Comfort, the confidential agent of and procurer of evidence for the complainants below.

South of Miller's mill, and in a straight line between it and the clover mill, is a house marked "C. Hess," occupied in 1873 by Peter Hess (Hess, *Id.* 59, Ans. 7); directly west of which, and on the same road with it, is a house marked "Jas." or "Jac. W. Moser," occupied in 1873 by Jacob W. Moser (Hess, *Id.*, 60, Ans. 35). The house south of the last-named and marked "H. G. Moser," was occupied during the same year by Jacob Collins. (*Id.*, Ans. 38.)

It is well to keep in mind these names and localities, as they are referred to more or less frequently, and a knowledge of them will enable us to better understand the force of the testimony.

(*a.*) *Testimony of defendants in sur-rebuttal:*

Samuel M. Deckman moved to the place on the Cumberland bank of the Yellow Breeches (marked on complainants' map "Dr. Whitman"), March 4, 1873, which date he positively fixes by the deed of conveyance which he received for said place (S.-reb. 248, Ans. 7–9; see also Hess D. S.-rej. 60, Ans. 40). He testifies that between the latter part of July and the 15th of August of said year, the watermelon flood occurred (Deckman S.-reb. 258, Ans. 10–14). After giving the details of the flood at some length, he testifies further that it took away one-half of the clover mill bridge (Ans. 17); [This he further explains in his subsequent deposition in sur-rejoinder, in which he gives fuller details]; and that he had occasiod to visit the site of the bridge directly after the freshet. (Ans. 36.)

"*Question* 42. When you were at Zinn's clover mill immediately after the flood of 1873, did you notice that the foot-bridge had been carried away?

"*Ans.* Yes, sir; that is what I had went for. I was told by my nearest neighbor, Andrew Shell—now dead and gone—that the half of the bridge had been carried away, and I went up to see."

George W. Atticks testifies, after fixing the date of the

Third—That David Smith, who is not shown to have any special means of knowledge, does not remember that the bridge was carried away in 1873. (*Id.*, 1899, Ans. 35.)

No further contradiction or impeachment of defendants' witnesses with regard to this bridge was attempted, except by the general statement of Henry M. Bitner with regard to all of the bridges in the "Upper End" of Lower Allen township, which statement will be discussed hereafter.

4. *Zinn's Clover Mill Foot-bridge.*—By far the greatest amount of testimony taken respecting the bridges related to this foot-bridge, which was the next above Eberly's Mills and the Etter and Shanklin mill. We will find it most convenient to consider this testimony in the following order, namely: testimony of (*a*) defendants on sur-rebuttal, (*b*) complainants in rejoinder, and (*c*) of defendants in sur-rejoinder,—first premising a few explanations with regard to the location of the bridge and the residences of some of the witnesses.

On the map of the vicinity of Eberly's mills, contained in complainants' book of exhibits, Zinn's clover mill appears. It is the building marked "Clover Mill," highest up the creek shown on said map, and stands on the west bank of the same, near several buildings marked "A Zinn."

The foot-bridge is not shown on the map, but it stood in 1873 and stands to-day a very short distance below the clover mill, and between the road which appears to cross the creek and the road which does *not appear* to, but in point of fact *does*, cross the creek.

Following the course of the stream, these houses appear on the Cumberland bank, namely: First, A. Zinn, occupied in 1873 by Adam Henry Zinn (Hess, D. S-rej., 61, Ans. 41). Second, Dr. Whitman, occupied in 1873 by Samuel M. Deckman (*Id.*, Ans. 40, and Deckman, *Id.*, 83, Ans. 37). Third, "E. Worley," occupied in the same year by Ezekiel Worley, opposite which is a point in the creek known as "Worley's Ripples" (Deckman, *Id.*, 17, Ans. 80). Below Worley's and around the bend of the stream on the York County bank, at the point where the road crosses the creek, by a bridge, is Miller's mill, at which, during the summer of 1873, lived Samuel C. Weber (Weber, *Id.*, 148, Ans. 1–3). Still farther down, but on the Cumberland County bank, is the house of John C. Comfort, the confidential agent of and procurer of evidence for the complainants below.

South of Miller's mill, and in a straight line between it and the clover mill, is a house marked "C. Hess," occupied in 1873 by Peter Hess (Hess, *Id.* 59, Ans. 7); directly west of which, and on the same road with it, is a house marked "Jas." or "Jac. W. Moser," occupied in 1873 by Jacob W. Moser (Hess, *Id.*, 60, Ans. 35). The house south of the last-named and marked "H. G. Moser," was occupied during the same year by Jacob Collins. (*Id.*; Ans. 38.)

It is well to keep in mind these names and localities, as they are referred to more or less frequently, and a knowledge of them will enable us to better understand the force of the testimony.

(*a.*) *Testimony of defendants in sur-rebuttal:*

Samuel M. Deckman moved to the place on the Cumberland bank of the Yellow Breeches (marked on complainants' map "Dr. Whitman"), March 4, 1873, which date he positively fixes by the deed of conveyance which he received for said place (S.-reb. 248, Ans. 7–9; see also Hess D. S.-rej. 60, Ans. 40). He testifies that between the latter part of July and the 15th of August of said year, the watermelon flood occurred (Deckman S.-reb. 258, Ans. 10–14). After giving the details of the flood at some length, he testifies further that it took away one-half of the clover mill bridge (Ans. 17); [This he further explains in his subsequent deposition in sur-rejoinder, in which he gives fuller details]; and that he had occasiod to visit the site of the bridge directly after the freshet. (Ans. 36.)

"*Question* 42. When you were at Zinn's clover mill immediately after the flood of 1873, did you notice that the foot-bridge had been carried away?

"*Ans.* Yes, sir; that is what I had went for. I was told by my nearest neighbor, Andrew Shell—now dead and gone—that the half of the bridge had been carried away, and I went up to see."

George W. Atticks testifies, after fixing the date of the watermelon flood, that he was at the site of the clover mill bridge after the flood, and saw that it was gone. (See Ans. 10, cited above, in connection with the forge foot-bridge.)

Mrs. Ellen Shaffer, a daughter of Andrew Shell (*Id.* 294, Ans. 2), who lived in 1873, near the clover mill in Cumberland County, not far from the creek (see supra and also map), whilst she lived two miles away, on the York County side of the creek (Ans. 8–18), testifies that she was in the habit of visiting her parents about every two weeks (Ans. 19 and 21), crossing the creek at the clover mill bridge; that she visited home about a week after the watermelon flood (Ans. 21, 22), and had to be taken across the creek in a boat by her father (Ans. 23), because the bridge at the clover mill was gone (Ans. 26). That it was gone she does not testify from mere rumor, but from personal observation (Ans. 70). She does not remember how long it was down, but when it was rebuilt she used it again (Ans. 27–29), crossing by boat only so long as the bridge was down. (Ans. 30.)

Isaac Gray, who lived about half a mile above the clover mill, between it and the fulling mill, at a point not shown on the map, testifies that the watermelon flood, the the date of which he fixes as in August, 1873, carried away the clover mill foot-bridge (*Id.* 311, Ans. 9), and that he went to the site of the bridge an evening or two after it was carried away, and saw that it was gone (Ans. 55-59), although he cannot remember the exact extent of the damage. (Ans. 58, 59.)

James Shaffer (*Id.* 284) testifies that the clover mill bridge was carried away by the watermelon flood in 1873 (Ans. 7), and remained down until May or June, 1874, when it was rebuilt by boss David Smith, John Greenfield being one of the laborers, and witness himself assisting. (Cross-ans. 44, 45 and 88–90.)

That witness was right with regard to the carrying away of the bridge in 1873, is abundantly shown by the testimony of the witnesses above cited, and was overwhelmingly shown by defendants in sur-rejoinder, but it is quite apparent that, with regard to the repairs of the bridge, he confounded different floods.

Jeremiah Grissinger testifies that at the time of the watermelon flood it was reported that the clover mill bridge was carried away by said flood. (*Id.* 388, Ans. 14.)

(*b.*) *Complainants' testimony in rejoinder.*

To this testimony the complainants replied *first* by attacking the date fixed by James Shaffer for the repairing of the bridge. They showed by a numher of witnesses (D. Smith, C. Vol. 3, 1894; D. Weaver, *Id.* 1917; A. H. Zinn, *Id.* 1955; W. Umbergher, *Id.* 1951; John Greenfield, 2014, and John Macallister, *Id.* 2082), that the repairing concerning which Shaffer testified, and in which Smith and Greenfield took part, was done in June, 1875, the bridge having been taken away the previous spring by the ice flood. Attention must be here called to the somewhat adroit but certainly unfair attempt to induce the Court to believe that defendants had set up the theory that the clover mill bridge, after being carried away by the August, 1873, flood, was not repaired until it was repaired by Smith and Greenfield, as follows: C. Vol. 3, 1961, A. H. Zinn.

"Q. 53. It has been suggested that that bridge was carried away in August, 1873, and was down until David Smith and John Greenfield put it up at the time you sent James Shaffer to help them; is that the fact or not?" And *Id.* 1975, W. Umberger.

"Q. 12. It has been alleged that the Zinn bridge was carried away by high water in the summer of 1873, and staid down until it was put up by Daniel Weaver and David Smith; is that the fact or not?"

No such thing has been alleged or suggested by any one except James Shaffer, and by him only in reply to questions put to him by complainants' counsel on cross-examination. It is of no great importance, but it illustrates the characteristic want of candor prevading the whole of complainants' proofs.

Second, by calling three negative witnesses:

(*a*) David Smith. (*Id.*, 1899.)

"Q. 35. It has been alleged that Zinn's clover mill bridge and Zinn's fulling mill bridge were carried away by a flood in August, 1873. Do you remember any such occurrence?" "A. No, sir." A mere want of recollection; and, besides, it is not shown that the witness had any special opportunities for knowing whether or not they were carried away in that year.

But they succeeded no better with

(*b*) A. H. Zinn. (*Id.*, 1961.)

"Q. 52. It has been suggested that that bridge was carried away in August, 1873, and was down during a considerable portion of that summer and fall; is that the fact or not?"

"A. No, sir."

* * * * * * * *

"C. Q. 103. I suppose you don't remember any flood in the Yellow Breeches Creek in the year 1873?"

"A. No, sir."

* * * * * * * *

"C. Q. 107. Counsel for complainants, in view of the testimony that has been given on the subject, formally admitted upon the record, after cross-question 50 of Daniel Weaver, that there was a flood on the Yellow Breeches Creek in August, 1873. Now, will you please explain how it is that although you were living on the banks of the creek, and although you had fields on both sides of the creek, yet you have no recollection whatever of that flood?"

"*A. My memory don't teach me so far back as that, unless I have something particularly to remind me of it.*"

Nor with (*c*) William Umberger. (*Id.*, 1975.)

"Q. 17. It has been alleged that the Zinn bridge was carried away by high water in August, 1873; is that the fact or not?

"A. To the best of my knowledge it was not.

"Q. 19. Could that bridge have been carried away so that people had to cross there in boats, or wade, after the flood went down, without your knowing it?

"A. I think not.

* * * * * * *

"Cross-Q. 43. In direct question 19 you were asked, 'Could that bridge have been carried away, etc., without your knowing it?' and you answered 'I think not.' To what flood had you reference in giving your answer?

"A. To the flood of 1875.

* * * * * * *

"Cross-Q. 107. In your 40th, 41st and 42d answers you say that you saw the clover mill bridge down in the spring of 1875, and also in the spring of 1884; are we to understand that those are the only two years in which you saw that bridge down?

"A. Yes, sir; to the best of my recollection.

"Cross-Q. 108. And you lived in the immediate neighborhood of it how many years?

"All my life, excepting two years; in all about twenty-seven years.

"Cross-Q. 109. I suppose you may have seen it down at times of which you do not recollect, may you not?

"A. Yes, sir; it is possible.

"Cross-Q. 110. And it may have been down whilst you lived near it, at times when you did not know it, may it not?

"A. Yes, sir; it might.

These are fair illustrations of the value of the negative testimony with which complainants have sought to rebut the positive proofs of defendants.

And *third.* By the general denial of the supervisor, Henry M. Bitner, that that bridge was carried away. He predicates this denial upon the fact that he received no notice to put up any foot-bridge over the Yellow Breeches Creek during his term of office.

To fully appreciate the entire worthlessness of the testimony of this witness, it would be necessary to read together his two depositions (1st dep. C. Vol. 3, p. 1929, and 2d dep., *Id.* 2350). For shuffling and evasion, looseness of statement and unreliability of memory, his testimony in this case is unique. It would be impossible, in the compass of a brief, to point out all of the discrepancies and contradictions of this witness, or the instances of his failure to understand or unwillingness to answer in a straightforward manner, questions which would have been plain to an ordinary intellect. It is not necessary to assume, and it is not here assumed, that he gave his testimony with any dishonest intent. He seemed throughout to be possessed with an idea that an attack was being made upon the honesty of his administration of the office of supervisor which must be resisted. In every question he detected a covert thrust which must be parried. It was, therefore, well nigh impossible to get information from him on cross-examination. His constant reply in his second deposition to questions when, where, and by whom certain work was done, being that "his accounts were satisfactory to the auditors and should be so to everybody else." For the statements which he did, when urged by repeated questions, make, he tells us that he relies partly upon his book and partly upon his memory. The book, however, is entirely unreliable. It is not a book of original entries made at the time the work was done. He testifies that the township work on roads and bridges during his term of office was done in the summer (2d dep. Ans. 38, 41, 44, 70; 1st dep. Ans. 61, 62 *et al.*, probably from April to October, if the month dates appearing in the book mean anything). Yet his book bears at the head of each page the year date "1874," and he testifies that the book was not "fixed up" until sometime after January 1, 1874 (2d dep., Ans. 32-37 and 53, all at one time, *Id.* 46, from four to nine months afterward). His custom was to keep the accounts of the hands employed himself, if he happened to be present; if not, to take the accounts given by themselves or "some one person that superintended" (2d dep., Ans. 56, 58, 59, 64). Some of his accounts were kept in writing (they are not produced nor is their absence accounted for), but he does not know that all were (*Id.*, Ans. 60); some of the accounts that were given him by others were in writing, and "some maybe not" (*Id.*, Ans. 68). He does not know whether or not he kept an account in writing of his cash payments. (*Id.* 62.)

After the book was fixed up in writing at the time above referred to, other accounts were handed to him and entered in the book in pencil (*Id.*, Ans. 79). Alterations of figures in the entries appear to have been made (*Id.*, Ans. 88 and 91), and after this fact came out in evidence, complainants' counsel hastened to contradict the witness, who had sworn that John C. Comfort had the book in his possession, by stating upon the record that the witness was "in error; that the book was brought from Mr. Bitner's house by the complainants' counsel and Mr. Comfort together and has been in the personal custody of complainants' counsel, exclusively ever since," evidently anticipating that the court would not form a very exalted opinion of the scrupulous honesty of their confidential agent and traveling companion. The book contains very few dates, and shows nothing as to the various places where work was done, and scarcely anything as to its character.

But the memory of the witness is even more unreliable than his book. This is shown throughout both of his depositions, and no adequate idea of the extent of his forgetfulness can be given except by quoting them entire. He has no recollection at all of the flood of 1873, which must have caused great damage to roads and bridges as well in his district as elsewhere. He recollects very little of the work that was done during his term of office, and even with his book before him, he cannot tell what work particular individuals did, nor where, nor, unless the date appears in his book, when; and as to minuter details his memory is a perfect blank.

The amount which he expended on roads and bridges during his term of office was $786.91, but when asked to look through his book and point out all the items of work at which he recollects of being present and superintending, he is able to remember only two; one item of $15.62 and another of $3.37 (second dep., Ans. 77). He seems, however, to have settled his account with the auditors, and then dismissed from his mind everything connected with the supervisorship. It appears that in 1873 he owned two farms, which occupied much of his time. (First dep., Ans. 51–54.) In his first deposition he declares that he supervised all the work on roads and bridges in the township, *except two or three times*, on wagon bridges over near Lisburn (Ans. 55). "I left very little for others to supervise—very little" (Ans. 74). He says he "supervised nearly all the road-making, both bridge-repairing, filling up mud-holes and opening drains, nearly all of it" (Ans. 75). In his second deposition, however, he admits that it did not suit him to superintend work over about Lisburn (Ans. 58 and 64), and that "a man (Joel Fetrow) superintended a few little odd jobs out there, and Michael Smyser; I don't recollect any others, if I mistake not" (*id.*, Ans. 65). But it appears from witness' book that Joel Fetrow was allowed pay for twenty days (*id.*, Ans. 66–68), or six days more than the supervisor himself. How many days Michael Smyser acted as superintendent or deputy supervisor does not appear, and the witness does not, it will be observed, say with great positiveness that there were no others.

It is quite easy to believe that bridges may have been carried away by the August, 1873, flood, and repaired by deputy supervisors without even the knowledge of Bitner, or, if he did know it at the time, without his recollecting it. If he had personally supervised all of the township work, and had been a man of reliable memory, his failure to remember the repairing of any bridges in 1873 might have been of greater value; but in view of the evidence of defendants in sur-rejoinder, it is entitled to none.

(*c*) *Testimony of defendants in sur-rejoinder.*

So far as regards the flood and bridge controversy the main attack of complainants in rejoinder was on the clover mill bridge. Whether or not it was swept away is not very material in the case. Whether it stood or fell in August, 1873, the witness, Hoffman, is amply corroborated. And with the flood formally admitted, the carrying away of the Etter & Shanklin and Andersontown bridges practically uncontradicted, and the carrying away of the forge and fulling mill bridges but feebly assailed, defendants might have rested, had they not desired to show to the court by evidence so overwhelming and conclusive that complainants would not dare to question it, the entire good faith and truthfulness of defendants' allegations with regard to the carrying away of the clover mill footbridge, and the utter groundlessness of complainants' attempts at denial of them. They, therefore, called a number of persons who were either eye-witnesses of the carrying away of the bridge in August, 1873, or resided in the immediate vicinity of it at that time. The following is an abstract of their testimony:

J. Y. Fetro (D. S.-rej. 2) testifies that he was present on one occasion when the foot-bridge at Zinn's clover mill was carried away by high water (Ans. 4); that George Haring and Frederick Deckman were with him at the time (Ans. 5–8); that they went together down to the creek to see it, having heard that it was high (Ans. 8–9);

that it was in the summer some time, but he cannot fix the year (Ans. 10–11); that he and Haring and Deckman stood near the bridge, and above it (Ans. 12 and 21); at the fording of the wagon road (Cross-ans. 32–33); and saw a tree-top, which had a branch sticking up out of the water, float down the stream, and strike and carry away the foot-bridge. (Ans. 13–19.)

On cross-examination he testifies that there were other folks present at the time, but he cannot remember who they were (Cross-ans. 29). And that it is his recollection that the foot-bridge was rebuilt the same fall that it was carried away (Cross-ans. 95–98).

Frederick Deckman (*id.* 11) testifies that he was present on one occasion in August, toward the last of it (Ans. 14), the year, however, he does not fix, in company with George Haring and John Fetro, when the foot-bridge at Zinn's clover mill was carried away (Ans. 3 and 4). He testifies that he and Haring and Fetro were standing about fifty yards or so from the bridge on the York County side (Ans. 5–7), when they saw a tree-top, or what was between a tree-top and a log (Ans. 11), with a hook on it, float down the creek and pass under the foot-bridge, which was caught and carried away by the hook (Ans. 7–9); that about a month afterwards, as nearly as he can tell, he went to the place of his brother, Samuel M. Deckman, who lived within about three hundred yards of the Yellow Breeches Creek, on the Cumberland County side, and then saw some piers similar to those belonging to the foot-bridge lying on the island at Hess's (Ans. 15–27).

George F. Haring (*id.* 27) testifies that on a certain occasion, about perhaps the last of August or beginning of September (Ans. 18), the year, however, he does not fix, he, John Fetro and Frederick Deckman went together to the Yellow Breeches Creek to see the high water (Ans. 3–7); that whilst they were standing on the York County side, just above the foot-bridge at Zinn's clover mill, they saw a tree upon which was a limb that stuck up, swimming down the creek (Ans. 8–16), and saw the foot-bridge caught and broken by the limb (Ans. 11, 12 and 21), and that the tree and the timbers of the bridge floated down the stream (Ans. 21–24). He remembers of hearing the ice flood talked about at the time it occurred, and thinks that the occasion concerning which he testifies was before the ice flood (Ans. 19, 20 and 27).

Edward P. Springer (*id.* 16), testifies that for ten years prior to 1877 he lived with Jacob K. Shell, who was his guardian, in Fairview township, York County, Pa., about a mile and a half from the foot-bridge at Zinn's clover mill (Ans. 4–8); that in the year 1873, whilst George W. Atticks lived in the tenant-house belonging to Shell, he (Springer) and Atticks owned a boat on the Yellow Breeches Creek, in partnership (Ans. 9–23); that he sold his interest in it to Atticks when the latter moved away from Shell's house (Ans. 15–17); that he never had an interest in any other boat (Ans. 10); that during that year in August, and whilst he and Atticks still owned the boat in partnership, there being a flood along the Yellow Breeches Creek, he went in company with Atticks and Shell to the creek to secure the boat (Ans. 25–29); that after having secured it Atticks went home and witness and Shell went down the creek as far as the foot-bridge at Zinn's clover mill (Ans. 31, 32); that they remained there for some time, and whilst there a tree having a limb or snag on it came down the creek, struck the foot-bridge and lifted it off (Ans. 37–39), and that the bridge and the tree then floated down the creek as far as he could see (Ans. 40); that the talk was, in the neighborhood at the time, that the bridges at the forge, the fulling mill, and Etter and Shanklin's mill were carried away by the same flood (Ans. 50–51).

Jacob K. Shell (*id.* 22) testifies that he has lived in Fairview township, York County, Pa., a mile and a quarter from Zinn's clover mill bridge, since 1852 (Ans. 1, 2); that in August, 1873 (Ans. 21), at the time of the water-melon flood (Ans. 9), whilst George Atticks was living in his (witness') tenant-house, the Yellow Breeches Creek being very high, he went in company with Edward D. Springer and George Atticks to it to secure a boat belonging to Springer and Atticks (Ans. 8–10); that having secured it, he and Springer went down the creek to the clover mill foot-bridge (Ans. 11, 12); that whilst they were at the foot-bridge they saw a tree come down top-foremost, and carry the bridge away (Ans. 15, 16), and bridge and tree went down the creek (Ans. 17) until they were out of sight (Ans. 18). He further testifies that he knew of the foot-bridge at Zinn's clover mill being carried away by the *ice flood*, but that happened a year or so afterwards. (Ans. 23, 24.)

He testifies on cross-examination that his brother, Andrew Shell, was a carpenter, and that, to his knowledge, upon one occasion, when he was not supervisor, he undertook to put up the clover mill bridge after it had been blown down in the dead of winter, and came near being killed by being caught between two logs at the time (Cross-Ans. 26, 27 and 32, 33). He further testifies, that "a lot of us neighbors put it up at that time, and we got our dinner at Adam Zinn's." (P. 25, Ans. 27.)

George W. Atticks (*id.* 35) testifies that he lived in Jacob Shell's house from April, 1873, to April, 1874, when he purchased a property near New Cumberland, and moved on to it. The date he fixes by his book account with Jacob Shell, and by the deed for the property, which he produced (Ans. 2–13); that whilst he lived in Shell's house he owned a boat in partnership with Edward D. Springer (Ans. 14–17), and that he purchased Springer's interest, when he (Atticks) moved away, and carried the boat with him to New Cumberland (Ans. 19, 20); that he has never since that time had any boat in partnership with Springer (Ans. 21); that whilst they had it in partnership they kept it in Yellow Breeches Creek, near Grindstone hill, and at the time of the watermelon flood, concerning which he testified in his former deposition (see D. S.-reb, p. 300), it was at that place (Ans. 22–24); that knowing the creek to be high he and Edward D. Springer went to secure the boat, his impression being that Jacob K. Shell was also along (Ans. 25–27); after having secured it he went home (Ans. 28, 29), and Springer and Shell did not accompany him. (Ans. 30.)

Mrs. Eliza Collins (*id.* 31) testifies that she lived with her husband Jacob Collins in York County, within a stone's throw of the Yellow Breeches Creek (Ans. 7), and 300 yards from Zinn's clover mill foot-bridge (Ans. 5), from 1868 to 1878 (Ans. 3), that during those ten years the foot-bridge was carried away four times, and was once blown down by a storm (Ans. 8); that it was first carried away in March, 1871, on a Sunday afternoon (Ans. 9); next in August, 1873, by high water (Ans. 10); the date she is enabled to fix by the birth of her youngest daughter, who was born June 22, 1873 (Ans. 11, 12);again in the latter part of February, or in March, 1875, by the ice (Ans. 13, 14), and again, the date she cannot give, by the breaking of Lantz's dam (Cross-Ans. 33, 34); and it was blown down by the storm one Sunday in October, but the year she cannot positively fix. (Ans. 40, 41.)

She testifies that the foot-bridge is not in sight from the house because of a grove of trees intervening (Ans. 6), but that it is visible from the spring where she was in the habit of getting water for the house (Ans. 23, 24). She testifies that at the time it was carried away in August, 1873); she did not see it fall, but she saw part of it going down the stream past her house (Ans. 19, 20); that it was taken away by a large tree at that time; that she did not see the tree taking the bridge, but saw the tree floating down the stream with part of the bridge timber. (Ans. 21.)

She further testifies that after being carried away by the in flood of 1875, the bridge was repaired in May or June—before hay-making—(Ans. 15), and that Daniel Weaver was supervisor, and had charge of the repairing (Ans. 16); that after it was carried away in August, 1873, it was put up "the same fall—the same season" (Ans. 17); and that "Mr. Henry Bitner was the supervisor, and Mr. Andy Shell did the work." (Ans. 18.)

Mrs. Adeline Moser (*Id.* 45) testifies that she lived in Fairview township, about a quarter of a mile below Zinn's clover mill foot-bridge for twelve years prior to 1878 (Ans. 1-9), and that she was in the habit of crossing said foot-bridge occasionally (Ans. 22, 23); that on the 14th of April, 1873, the day her daughter was born, Clara Eppley came to live with her, and remained until the next spring (Ans. 15-18); that whilst Clara Eppley was living with her in the summer of 1873, when the corn was up pretty well, there was a flood in the creek which damaged her husband's corn (Ans. 24-29), and which brought down a tree or log which knocked the foot-bridge away

(Ans. 30, 31); that she was told by the nearest neighbors that the bridge was taken away by a tree. (Ans. 44.)

Jacob W. Moser (*Id.* 50) testifies that he formerly lived on the Yellow Breeches Creek near Zinn's clover mill (Ans. 2); that there was a flood along said creek in August, 1873, in roasting-ear time (Ans. 3-6, 10); that Clara Eppley lived in his family at the time (Ans. 8), having come there in the spring of the same year (Ans. 20); that during said flood the foot-bridge at Zinn's clover mill was carried away by a tree or log (Ans. 12, 13). He remembers that said bridge was carried away by the ice flood, which happened about two years after it was carried away by a tree or log (Ans. 14, 15). He produces a book account which shows that Clara Eppley came to live in his family April 14, 1873. (Ans. 20.)

Mrs. Clara Boyer (*Id.* 54) testifies that she began to live with the family of Jacob W. Moser, in Fairview township, York County, Pennsylvania, on the day that their daughter Hattie was born, April 14, 1873, and lived there one year (Ans. 2-5); that whilst she lived there during the summer of 1873 Mr. Moser had a field of corn which was damaged by cattle getting into it, the fence having been washed away that year by a flood (Ans. 10-15); that at that time the foot-bridge at Zinn's clover mill was taken away by a tree, or a part of a tree (Ans. 16, 17); that in 1875 the clover mill bridge was again damaged by an ice flood (Ans. 18), but that she was not living at Jacob Moser's at the time. (Ans. 19, 20.)

She further testifies that her knowledge of the carrying away of the foot-bridge in 1873 was obtained by hearing people speak of it at the time. (Ans. 21.)

Peter Hess (*Id.* 56) testified that he farmed at a place (marked "C. Hess" on complainants' map) belonging to his father, in Fairview township, York County, along the Yellow Breeches Creek (Ans. 2-10), that he took possession of it in the spring of 1873, and continued to farm it until the spring of 1880 (Ans. 9-10); that Hess' Island is situated in the Yellow Breeches Creek, a short distance from, and within sight of, the place where he was accustomed to water his horses (Ans. 12 and 25); that a flood occurred along the Yellow Breeches Creek "in August, or after the 9th of August, 1873" (Ans. 23); that after the water fell, so that he could get down to the creek to water his horses, he noticed lying upon the upper end of said island "a log containing a limb, with a pier or pillar of a foot-log" (Ans. 26-34).

Minnie A. Deckman (*Id.* 63) testifies that she is a daughter of Samuel M. Deckman, and moved with him, where he now lives, on the 4th of March, 1873 (Ans. 1-3); that she remembers a flood in the Yellow Breeches Creek in August, 1873 (Ans. 4). She testifies that the water was very high at that time, and that the foot-bridge at Zinn's clover mill was carried away by a "large stub of a tree" (Ans. 5, 6), which she saw at Hess' Island about three or four days after the bridge was carried away (Ans. 7-10); that "there was bridge timber on the one part of the tree" at that time (Ans. 11); that about four or five weeks after that stub of a tree came down in front of her father's meadow, and lodged there (Ans. 12, 13); that she saw the tree a good many times after it took the bridge away, and remembers it with sufficient distinctness to make a sketch of it (Ans. 14-16), which is offered in evidence (Ans. 65); that the tree subsequently floated down to "Worley's Ripples," and the top being cut off of it there, the root part was afterwards carried off by high water (Ans. 17, 18). She remembers an ice flood in the Yellow Breeches, which, she testifies, was after the flood of 1873 (Ans. 19, 20). She further testifies that during the first summer that her father lived on the farm which he now occupies, he did some work on the roads, working under Andrew Shell, Henry Bitner being the supervisor at the time. (Ans. 21, 24.)

George Martin (*Id.* 65) testifies that the tree having bridge timber entangled with it, which he before testified he had seen coming down on the flood (see D. S.-reb., p. 309, Ans. 13), he first saw "a little above Hess' Island coming down" (Ans 1); that he was at the time going up along the Cumberland side in a boat (Ans. 2); that he saw the tree lodge at the island (Ans. 3, 4), where it remained for some time, he cannot tell how long, as he didn't take particular notice when it went away (Ans. 5), and afterward floated down and lodged in front of Samuel Deckman's house (Ans. 6, 7). When he saw it lodged at the upper end of Hess' Island the bridge timber was still entangled with it (Ans. 8 and 10), but that he never saw the bridge timber down at Deckman's. (Ans. 9, 10.)

Samuel M. Deckman (*Id.* 78) testifies that he first saw the tree which is said to have carried away Zinn's clover mill bridge in August, 1873, "lodged against a little island, sometimes called Hess' Island, a short distance below the foot-bridge—about five hundred yards—three or four days after the water went down so that a body could get up along the shore, I saw it first." (Ans. 6.)

He further testifies the time when he saw it was "in 1873." As near as I can get at it, between the latter part of July and the 15th of August" (Ans. 9); that a part of the bridge timber, a pier, was then hanging to it. (Ans. 11, 12.)

He testifies that "it lay there for some time—probably three or four weeks—and then it became loose after the bridge timber was taken off, from the creek having raised a little, and it then floated down to my place, lodged there against the shore on the Cumberland side till in '75—the ice flood—then it floated to my next neighbor below, Ezekiel Worley, hooked fast there on the York County side against a buttonwood tree that leaned over the creek; sometime during that summer that upright limb that caught the foot-bridge had been chopped off by some one of Worley's family there; after the creek raised again after that the tree went away; that was the last I ever saw of it." (Ans. 16.)

He further testifies that the York County bank of the creek at the foot-bridge "is very high, probably twenty-five feet," whilst the Cumberland bank is low, only from four to six feet high (Ans. 286); that the foot-bridge was composed of six logs or stretches (explanation and Ans. 77), which appear to have been arranged in three pairs (*passim e. g.* Ans. 174); that York County end rested upon the high bank (Ans. 172), whilst a tree and a post formed the abutment on the Cumberland side (Ans. 158 and 164), and the bridge was supported in the middle by two piers. (Ans. 80.)

He further testifies that he was told "that the foot-bridge was knocked down by a tree." Mr. Shell, "right after the flood—the same day," within a few hours after the accident occurred—Mr. Shell remarking at the time, "a little while before the tree came down—I chained it fast—towards morning. If I hadn't a-chained it, the whole business would a-went away" (Ans. 74); that he, Deckman, thereupon went up to the clover mill to see the damage that had been done, and found that none of the foot-bridge remained standing except the pier next to the Cumberland County bank, and the post on said bank (Ans. 166 and 272), with these exceptions, the whole bridge being thrown down (Ans. 70 and 166), and one-half of it, three logs and one pier, having been carried away, and the other three logs being chained fast to the tree on the Cumberland County bank. (Ans. 70 and 173-4.)

He further testifies that he had frequent occasion to cross the creek by the fording at the clover mill bridge (Ans. 85), and that he saw it down a couple of dozen times (Ans. 85 and 69); that it did not remain down very long, but was rebuilt in the fall of 1873, either in September or October. (Ans. 65-67.)

He further testifies that he worked on the roads in Lower Allen township in 1873 (Ans. 21); that Andrew Shell engaged him to do the work (Ans. 22); that Henry M. Bitner, who was the supervisor that year (Ans. 24, 25), was not present when he did the work (Ans. 30), but subsequently paid him for it (Ans. 26-29); that in the fall of 1873 Andrew Shell asked him (witness) to help him put up the foot-bridge at Zinn's clover mill, but that he declined doing so on account of rheumatism. (Ans. 32-34.)

Samuel C. Weber (*Id.* 148) testifies that he lived at Miller's Mill, Fairview township, York County, from the first week in February to the first day of October, 1873 (Ans. 1-3); that there was a flood along the Yellow Breeches Creek whilst he lived there, between the 10th and 15th of August (Ans. 11 and 12); that he saw two logs—apparently nailed side by side—come down the creek on that flood, and go over the dam (Ans. 13); that about a week after the flood he had occasion to go up to Zinn's clover mill to see Mr. Adam Zinn (Ans. 14); that he could not cross the creek there because the bridge was gone (Ans. 16 and 17); that the York County side was gone, and the other side hung apparently fastened to a tree (Ans. 18); and that the pier on the York County side was gone, and the other left. (Ans. 19.)

It appears from the deposition of HENRY S. RUPP (D. S.-rej., p. 227), the township clerk of Lower Allen township, and from the township book produced, that Henry M. Bitner, the Supervisor for the upper end of Lower Allen township, was allowed for township work $786.91, and for his own time, 14 days, at $1.50 per day, $21.00. It further appears that from the year 1866, down to the present time, with the exception of the year 1877 ($878.-27), the amount expended by Henry M. Bitner was larger than the amount expended by any other supervisor in the "upper end." It also appears that from the year 1866, down to the present time, the allowance to Henry M. Bitner, for his personal services as supervisor, was less than the amount allowed any other supervisor for similar services in the same district.

In explanation of this state of facts, Mr. Rupp, who, in addition to being township clerk, had been during almost all that period one of the township Auditors, and who was one of the Auditors who settled Bitner's account, testifies that "Mr. Bitner gave most of the work out by contract, and did not look after it himself as the other supervisors had done before."

It is easy to see, therefore, how foot-bridges might have been carried away in August, 1873, and repaired soon afterwards without the knowledge of Bitner, and how, even if he knew of the fact at the time, he may have forgotten it. His book furnishes no information with regard to the location or character of the work done and seldom even its date; his memory is poor and his custom of committing the township work to others instead of superintending it himself, deprived him of the means of knowledge necessary to render him competent to negative the testimony of so many witnesses. We have already seen that his testimony cannot affect the Andersontown bridge, as a county bridge was built there in 1873.

We have thus five eye-witnesses to the carrying away of the clover mill bridge in August, 1873, two of whom, Springer and Shell, fix not only the season of the year, but the year itself, and they are corroborated by Atticks.

It is true that Fetro, Haring 2nd Frederick Dickman are not able directly to fix the year, but the circumstances they relate are the same as those given by Springer and Shell, and this, together with the fact to which Fetro testified, namely, that others were present; that Haring testifies to, namely, that it was before the ice flood of 1875; that Deckman testifies to, namely, that he soon afterwards saw the bridge timber on "Hess Island," and the further fact that all three concur in fixing the occurrence in the summer time, clearly show all five witnessed the same destruction of the bridge. Moreover, the subsequent fate of the tree which did the damage is traced. Martin and Mrs. Collins saw it float down the creek with bridge timber sticking to it; Martin saw it lodge on Hess Island, whilst Samuel M. Deckman, George Martin, Minnie A. Deckman and Peter Hess saw it with the timber still sticking to it after it had lodged there, and witnesses saw it still further down the creek.

Furthermore, we have the testimony of seven persons who lived in the immediate neighborhood, and who were accustomed frequently to cross the bridge, that it was swept down at the time of the flood of August, 1873, to wit: Mrs. Collins, Mrs. Moser, Jacob W. Moser, Mrs. Boyer, Minnie A. Deckman, Samuel M. Deckman and Samuel C. Weber, and of these all but Weber testify that the bridge was thrown down by the tree.

As to the extent of the damage done to the bridge none of the witnesses in sur-rejoiner except Deckman and Weber testify definitely. According to them, whilst none of the timbers except a pier and a post remained in position, only about half of them floated away; the rest, having been chained to a tree, swung around and remained along the Cumberland shore. Those who were eye-witnesses of the accident say that the timbers, without, however, saying how many of them, floated out of sight. Possibly if questioned they might have been able to be more definite; possibly not, however. For in the excitement of the occasion, with the flood running high, they might not have noticed those which clung to the Cumberland shore, and the chaining of them, by keeping them partly under water, may have kept them partly out of sight.

As to the repairing of the bridge, Samuel M. Deckman, who was accustomed to cross the creek frequently by the fording at the bridge, and who did so a couple of dozen times, between the time it was carried away and time it was rebuilt, and was therefore well qualified to testify upon the subject, says that he did not actually see the work done, but that it was rebuilt in September or October, 1873. He says also that Andrew Shell asked him (witness), at the time it was rebuilt, to help put it up, but witness declined on account of rheumatism. His testimony shows further that Shell was, during that year, acting as a deputy supervisor under Henry M. Bitner, as witness did work on the roads at that time by direction of Andrew Shell, and was subsequently paid for that work by Bitner. In this he is corroborated by his daughter, Minnie A. Deckman.

Mrs. Collins, whose whole deposition shows her to be a woman of exceedingly clear memory, testifies positively that the bridge was put up "the same fall, the same season; that Mr. Henry Bitner was the Supervisor, and Mr. Andy Shell did the work;" and it must be remembered that the bridge was plainly in sight of the spring where where she got the water for her household use.

Andrew Shell was a carpenter (Jacob K. Shell. D. S. rej., p. 26 and 32; George S. Sipe, D. S.-rej., p. 269 and 32, Ans. 32), and had been employed to repair this same bridge on two other occasions—once in August, 1871, when David Smith worked for him (D. Smith, C. Vol. 3, p. 1895, Ans. 7), and once when the bridge had been blown down in the dead of winter, and at the time of repairing the hands were unwilling to get into the water, but were compelled to do so in order to rescue Andrew Shell from a perilous position. This, however, was a good while before the accident to the bridge at the time of the flood of 1873. (Jacob K. Shell, D. S.-rej., pp. 25, 26, Ans. 26, 27, and 32–34.) He was not supervisor at this time (*Id.* Ans. 33); nor was he in 1871, as Samuel M. Bitner held that office for the upper district of Lower Allen township in that year (see H. S. Rupp D. S.-rej., p. 229); yet he had charge of repairing the bridge, and, so far as the testimony shows, no regularly elected supervisor was present (Ans. 9). The care with which he secured the

Cumberland end of the bridge by chaining it fast "*towards morning*," is at least an indication that he felt some responsibility with regard to the township property. The result of his precaution was that all of the Cumberland side of the bridge was saved, and thus the expense for its repair falling upon his township could have been scarcely more than the cost of the necessary labor. Unfortunately, Andrew Shell is dead, and cannot give any information upon the subject. As is also his son, Abraham Shell, who is shown by Bitner's book to have worked for the township (H. M. Bitner, C. Vol. 3, p. 2360, Ans. 72), and may have been employed on this very work.

Were the question one of any great materiality, and did time and space permit, a number of other reasons might be offered in support of the testimony of Deckman and Mrs. Collins; but enough has already been said to show that that testimony is more reliable than the negative testimony of such a witness as we have seen Henry M. Bitner to have been.

Adam Baker, the York County supervisor, was not called by either side on account of his age and infirmities. (See statement of complainants' counsel, C. Vol. 3, p. 2081.) However, his son, Isaac Baker, was one of complainants' agents employed in collecting testimony, and it is fair to presume, from the desperation with which they have fought ths case throughout, that if they could have derived any information of value through Adam Baker, they would have contrived some method of using it.

But, *to conclude*. The result of the flood discussion is, that instead of the witness E. B. Hoffman being contradicted and his date shaken, he is overwhelmingly corroborated in every important particular, and the fact that he did see talking-machines at Drawbaugh's shop at the time and under the circumstances he testifies to, established by additional testimony.

APPENDIX C.

COMPLAINANTS' NEGATIVE WITNESSES.

Mr. J. Bailey (C. Vol. 2, 1095) testifies that on the 3d of March, 1878, he accompanied George W. Heiges and George W. Mumper to Drawbaugh's shop; that Daniel Drawbaugh then and there showed them his electric clock and explained it at length, but that he did not mention the subject of electric speaking telephones or talking machines. See George W. Heiges, *infra.*

Cyrus Bowman (C. Vol. 1, 666) testifies that he lived at Eberly's Mills from April 1, 1874, to March 1, 1876, during which time he ran the grist-mill owned by George Leonard; that during that time he was down at Drawbaugh's shop at various times, "sometimes on business and sometimes not." He remembers of seeing several of Drawbaugh's inventions, but denies that he ever saw or heard of Drawbaugh's talking machine while living at Eberly's Mills. "I didn't see anything of the kind, nor I didn't hear Mr. Drawbaugh say anything of the kind, or anybody else" (p. 674, Ans. 46).

On cross-examination, however, he is able to recall, of all the machines that he saw at Drawbaugh's shop, only "a clock, a nail cutter, and a bell, a machine that he had," and fails to remember a large number of Drawbaugh's machines which are testified to as being there at that time by numerous others of complainants' witnesses (*e. g.* D. A. Hauck, C. Vol. 1, p. 820; E. M. Nichols, C. Vol. 1, p. 861). He admits further that he saw there "some of his (Drawbaugh's) nicknacks that he was working at."

Cross-Q. 152. Did you know what the nick-nacks were?

Answer. No, sir. He always had different machines there that he was working.

Cross-Q. 153. And you didn't know what they were, did you?

"A. It would have been very hard for a man to understand what they were."

He is contradicted:

First—By Frank D. Hackett (D. S.-reb., 690), who testifies that he moved to Milltown with Cyrus Bowman, and worked for him there from the spring to the fall of 1874; that he heard Drawbaugh's talking machine talked of at Milltown in the mill and in the store, "in the spring of 1874, while I working for Cyrus Bowman."

He further testifies that he heard a good deal of talk about it backward and forward by the people in the neighborhood, among others, by the storekeeper, Abner Wilson (store blown up January 19, 1878, C, Exhibits 401, killed, prior to November 5, 1875, *Id.* 402) and by Cyrus Bowman himself.

Second—By his sister-in-law, Mrs. Margaret Sweigert (*Id.* 869), who testifies that she visited in Mr. Bowman's family while he resided at Eberly's Mills, and then and there heard Daniel Drawbaugh's talking machine spoken of. "I heard my sister and brother-in-law Mr. Cyrus Bowman, and his wife and their children speak of it. They said it was a talking-machine—called it a talking machine."

She further testifies that the children of Cyrus Bowman to whom she refers were his two oldest daughters, who both died in December, 1874. (See Mrs. Martha M. Bowman, C. Vol. 3, 2011, Cross-Ans. 30.)

Third—By his brother-in-law, J. Porter Harris (D. S. reb., 465), who testifies that he visited Cyrus Bowman whilst the latter resided at Eberly's Mills from April 1, 1874, to March 1, 1876; that he then heard Daniel Drawbaugh's talking machine talked about in Bowman's family by his children—he thinks by his oldest daughter, who is dead.

Complainants attempted to reply to this testimony by calling Mrs. Martha M. Bowman (C. Vol. 3, 2008), who testifies that she never heard of Drawbaugh's talking machine whilst she lived at Eberly's Mills.

And by recalling Cyrus Bowman himself (C. Vol. 3, 2013), who testifies that whilst he lived at Eberly's Mills there never was any talk in his family, by his wife, or either of his children then living, or himself, about Daniel Drawbaugh having a talking machine.

He further testifies that he never talked to or heard his wife or children talk to either J. Porter Harris or Mrs. Margaret Sweigert about Daniel Drawbaugh having a talking machine.

It is perhaps, however, significant that he does not deny having conversation with Frank D. Hackett on the subject.

Jacob Carns, C. Vol. 1, p. 883, testifies that he began to work in the machine shop at Eberly's Mills, August 10, 1868, for the Drawbaugh Manufacturing Company, and continued to work for said company until February 4, 1871, and produces a book account fixing those dates.

He further testifies, and produces book entries in corroboration, that he boarded in Daniel Drawbaugh's family from February 27, 1869, until August 7, 1869; and that between the spring of 1871 and December, 1875, he called several times at Drawbaugh's shop and house. Besides boarding in Drawbaugh's family his personal relations with the members of it seem to have been intimate, much of his leisure time being spent with them.

He further testifies that several others of the shop hands boarded at Drawbaugh's at the same time he did, and that during that period Drawbaugh had living in his family a domestic, named Maggie Darr.

In his deposition he gave a list, comprising a large number of machines and contrivances which he understood that Drawbaugh had got up or devised. (C.Vol. 1, 891, *et seq.*, Ans. 43, *et seq.*) But when shown respondent's exhibits A to Q, inclusive, he denied having seen anything like them at Milltown, either at Mr. Drawbaugh's shop or his house. (*Id.* 894, 895, Ans. 71–73.)

He further testifies as follows:

"Q. 74. Please state whether you ever heard from Mr. Drawbaugh, or any one else, while you worked at Milltown, or during any of your subsequent visits there, that he had a talking machine by which a person could transmit speech from one place to another by speaking at one end and listening at the other?

"A. I don't remember of ever having heard anything.

* * * * * *

"Q. This present controversy began in the summer of 1880, that is, about two years and a half ago. I wish to know whether or not you had ever heard from any one before that time, that Daniel Drawbaugh had invented, or claimed to have invented, a talking machine by which what a person said at one place would be transmitted to and heard at another by means of electricity?

"A. I have not."

And further, that he did not think that Mr Drawbaugh could have had talking machines, and been in the habit of showing them generally to people, between August, 1868, and February, 1871, without his knowing it; nor could Drawbaugh have had talking machines during said period without his knowing it.

And further, that judging from their personal relations, and his position in the shop as a young man of eighteen or twenty, if Drawbaugh had had occasion to experiment much by having some one to talk or sing into a talking machine, he thought he would naturally have asked him to assist in that way.

In contradiction of Jacob Carns, defendants called several witnesses, the first of whom was Mrs. Margaret Brenneman (D. S.-reb., p. 103, *et seq.*), who testifies that her maiden name was Maggie Darr; that she had lived at Milltown, or Eberly's Mills, up to some time in 1870, when she moved away; that she was never back to Milltown again except once, when she passed through without stopping, some time prior to December, 1872; that she lived in Daniel Drawbaugh's family about eight or nine weeks, whilst Jacob Carns, John Schrader and several others were boarding in it.

She testifies that at the time she saw Drawbaugh's talking machine, and that it was a good deal talked of in Drawbaugh's family and among his boarders; that she heard his wife and his boarders all talk about it, mentioning particularly Carns and Schrader; that she is positively sure she heard Jacob Carns talk about it at the time she lived in Mr. Drawbaugh's family, and he boarded there.

She is corroborated by Mrs. Mary M. Darr, her mother (*Id.* p. 109), who testifies that she heard her daughter Maggie speak of Mr. Drawbaugh's talking machine while she (Maggie) lived in Mr. Drawbaugh's family, and that prior to December, 1870, Mr. Drawbaugh's talking machine was generally known and talked about among the people at Milltown.

2. William H. Zearing (*Id.* 122 *et seq.*), who testifies that he first saw Drawbaugh's talking machine several years prior to November 35, 1873: "It was at the time that Jacob Carns was working at the shop" (*Id.* 125, Ans. 126); that Jacob Carns was present at the time in the shop, and further as follows (*Id.* 125, Q. 29): "Did you ever have any conversation with Mr. Jacob Carns about Daniel Drawbaugh's talking machine; if so, when and where?

"A. Shortly after I had seen it the first time, I met him about Shiremanstown, and spoke to him as regards to this talking machine. I considered it rather of a humbug, and asked him his opinion of it. He expressed himself as I did about it, and did not seem to think it would prove a success."

3. Samuel H. Bates (*Id.* 380), who testifies (*Id.* 382, Ans. 19 *et seq.*) that Jacob Carns told him at Shiremanstown, in 1878, when he (Carns) was home settling up the estate of his mother, that he (Carns) had seen Drawbaugh's talking machine "when he was working for Drawbaugh at the faucet business." [Carns testified (C.Vol. 1, 890) that his mother died in April, 1878, and that he was back to Shiremanstown in May, 1878.]

4. John C. Schrader (D. S.-reb., 467), who testifies that he worked for the Drawbaugh Manufacturing Company from some time in November, 1868, to some time in April, 1869; that during part of that time from some time in March, 1869, until he left Milltown in April, 1869, he boarded at Daniel Drawbaugh's, in company with Charles Umberger and Jacob Carns; that Carns was still boarding at Drawbaugh's when he left; that Maggie Darr lived in the family at the time; that during that period (November, 1868, to April, 1869) Daniel Drawbaugh showed him his talking machine in his private room at the machine shop.

He identifies "Exhibit B," and testifies with regard to its missing parts. He further testifies that he recollects of Mr. Drawbaugh speaking of it *at the table* on several occasions.

Wm. Darr (C.Vol. 1, 158) testifies that he lived at Eberly's Mills, or Milltown, for twenty years prior to the last day of March, 1870; that whilst living there he frequently went to Daniel Drawbaugh's shop; that he never saw any talking machine there, and never heard of any there.

On cross-examination, however, he admits that he did have a conversation on the subject whilst living at Eberly's Mills, with Daniel Drawbaugh, in which Drawbaugh spoke of talking across the sea; whereupon he (Darr) replied: "Oh, you had better try the Yellow Breeches first," and further said: "What is the matter with you, Dan; are you going crazy?" He shades off Drawbaugh's remark, however, to a mere suggestion, that the time was "coming when we can talk across the sea," and denies that Drawhaugh said he was going to do it, or had a machine that could do it, or anything of the kind.

He is contradicted:

First—By his wife, Mrs. Mary M. Darr (D. S.-reb. 100), who testifies (110, Ans. 12, 13): "He (Wm Darr) came in one day and said to me that Mr. Drawbaugh was speaking of making a telephone, or some sort of a talking-machine, that he could talk across the ocean with to other parts of the world; I don't remember just how he spoke it."

"Q. 13. Did he tell you what he said to Mr. Drawbaugh? if so, what was that, as you remember it?

"A. He told him he had better invent something to talk across the Yellow Breeches first."

She further testifies that this conversation was in 1866, and that prior to their removal from Milltown, Drawbaugh's talking machine was generally known and talked about among people there.

She further testifies that before they moved away from Milltown, her husband, Wm. Darr, was a man of intemperate habits, and that the use of intoxicating liquors affected his nerves a great deal; his nervous system has gradually grown worse for some years, and has affected his memory. Further that she was compelled to separate from him on account of his intemperate habits, abusive treatment, and his failure to provide for her.

Second—By his daughter, Mrs. Margaret Brenneman (*Id.* 103), who testifies that Drawbaugh's talking machine was a matter that was known and talked about in her father's family; that her father, whilst living at Milltown, drank a great deal, so much as seriously to impair his bodily health and mental condition, and that to the best of her knowledge since that time he has been a man of unsound condition; he has been afflicted with a nervous disease, which has affected his memory very much.

Third—By his son-in-law, John M. Brenneman (114) who testifies that shortly after his marriage (December 24, 1872), in 1873, he heard the talking machine spoken of at different times in Wm. Darr's family.

Fourth—By his daughter, Mrs, Jennie M. Brown (*Id.* 163), who testifies that prior to her marriage [July 7, 1868], she often heard Drawbaugh's talking-machine spoken of by her "father" (Wm. Darr), "and mother and folks that came in at home," and that it was all the tolk at Milltown for a while, she having heard many people speak about it; and further that her father has been nervous and weak-minded for two or three years; and that his memory has not been reliable for that length of time.

Fifth—By Jacob M. Peterman (*Id.* 471), who testifies that he first heard of Drawbaugh's talking machine from Wm. Darr, whilst the latter lived at Eberly's Mills, and that Darr went with him down to Drawbaugh's shop for the purpose of seeing it, but Mr. Drawbaugh was not in, and they failed to see it.

Abraham Ditlow (C. Vol. i.,967) testifies that he moved to Wheeler, Indiana, in the spring of 1876; that he returned East in the fall of the same year, going West again in the spring of 1877, and never returning to the East again until brought to Philadelphia to testify.

He is assisted by counsel for complainants in fixing the date when he last went out West as about March 19, 1877, by means of a railroad shipping receipt, commented upon in the discussion of the testimony of Joseph Ditlow.

It appears from his testimony, and that of his brother, Joseph Ditlow (*Id.* 958, *et seq.*), that the witness, prior to the spring of 1876, lived in the neighborhood of Eberly's Mills. He testifies that he had known Daniel Drawbaugh before that time, and had been in the habit of going to his shop a good deal; that he was intimate with Daniel

Drawbaugh's nephew, George Drawbaugh, and was in the habit of seeing, at the shop of the former, the things which he, Daniel Drawbaugh, had gotten up, or invented, of which he names a number.

He further testifies that whilst in the East, during the winter of 1876-77, he spent part of his time at Milltown; that whilst there in the spring of 1877, he heard George Drawbaugh speak of Daniel Drawbaugh's talking machine; that George Drawbaugh spoke of it as if it were a new thing, and said his uncle was going to make a fortune out of it if he could get it working all right; that it impressed him (witness) as a new thing, that he had never heard of it before, and "couldn't believe it very handy."

He further testifies that he has never seen at Drawbaugh's shop a talking machine, or anything of the kind, and, upon examining exhibits "A" to "J," inclusive, denies ever having seen any of them.

Upon cross-examination he repeats his testimony, given on direct examination, and denies with the utmost emphasis, not only all knowledge of Drawbaugh's talking machine prior to the spring of 1877, but also the possibility that Drawbaugh could have had a talking machine at his shop before that time without his knowing it.

He is contradicted:

First—By his sister, Mrs. Mary A. Evans (S.-reb., 61), who testifies (67) that prior to the death of her father, Abraham Ditlow (which happened February 21, 1873), Drawbaugh's talking machine was spoken of in his family in a conversation in which her father took part; and that her brother, Abraham Ditlow, was present at the time.

Second—By Alexander Milner (*Id.* 512), who testified that he became acquainted with Abraham Ditlow in Wheeler, Porter County, Indiana, soon after the latter went out there in the spring of 1876; that some time in the spring of 1876, whilst Abraham Ditlow was working under him, the latter, in a conversation about the progress of invention, told him about Daniel Drawbaugh's talking machine, and, further, told him that he had seen and talked through it at the time when he (Ditlow) went to Drawbaugh's shop to see about getting a stove made to go trapping with.

He further testifies that Abraham Ditlow told him at that time that Drawbaugh had not taken out a patent on his talking machine, because he was too poor to do so.

Third—By C. B. Clifford, who testifies (*Id.* 515) that he became acquainted with Abraham Ditlow in 1876, near Wheeler, Porter County, Indiana; that in May or June of that year, Ditlow told him that a man in the East, by the name of Daniel Drawbaugh, had invented a talking machine with which he could talk through the shop. He remembers that Ditlow said there was a glass tumbler attached to one end of it; and he understood, from what Ditlow said, that the latter had seen it some time before that, but how long he (Ditlow) did not say.

He further testifies that Ditlow told him that Drawbaugh had said he was too poor to have it patented.

And, *finally*, Abraham Ditlow himself was recalled by defendants (D. S.-reb., p. 876), when he testified that since giving his depositions for complainants, he had reflected further, and remembered to have seen and heard Daniel Drawbaugh talk through the talking machines as early as the fall of 1874 (Ans. 11–45 and Cross-Ans. 63, *seq.*), and that he was satisfied that he had seen it before that time (Ans. 46). He relates in detail the circumstances under which he saw and heard Drawbaugh talk through the talking machine in the fall of 1874.

Joseph Ditlow, of Wheeler, Porter County, Indiana (C. Vol. i., 958), testifies that he formerly lived at or near Eberly's Mills before he went West; that he went West the last time in 1877, which date he fixes by a railroad receipt for the shipment of "two boxes H. H. goods from Marysville, March 19, 1877, from Joseph Ditlow, marked Joseph Ditlow, Wheeler, Porter County, Indiana;" that he has lived near Wheeler ever since, and has not been East since that time; that he had been in the habit of going West for the farming season before that time from 1869 or 1870; that during that time he spent his winters East, principally trapping in winter time, and considered his home East, and in the neighborhood of Milltown; that when so East in the winter, he was in the habit of frequenting the store at Eberly's Mills, and of going to Daniel Drawbaugh's shop from time to time.

He mentions a number of Drawbaugh's inventions which he had seen there, but testifies that he first heard that Daniel Drawbaugh had a talking machine, or anything that was claimed to be a talking machine, in the store at Milltown from George Drawbaugh, who came in laughing, and said: "I had lots of fun with Dan, talking on a wire," and that George listened at one end whilst Dan talked at the other, and then changed positions; that this occurred in the winter of 1876–77, and witness thinks it was in the latter part of the winter; that when he heard George Drawbaugh's remarks, the talking machine struck him as something new, which he had never heard of before in his life.

He further testifies that he never saw any machine at Milltown at any time which he understood was a talking machine, or which he was told was a talking machine, and beyond the magnet on "C reproduced" he fails to identify any of the exhibits which are shown him. On cross-examination he testifies that he thinks he did his first work on the farm of Harmon Hardesty in Indiana in 1873; that he spent the winter of 1873–74 East, and thinks he was trapping in the East in the winter of 1874–75; that he spent the winter of 1875–76 in Indiana, and 1876–77 in Pennsylvania; that he thought Drawbaugh's talking machine a very wonderful invention, the most interesting and wonderful of all Daniel Drawbaugh's inventions, and that although he never went to the shop to see it, yet he told Mr. and Mrs. Hardesty about it after he went West in the spring of 1877, and whilst he was living with them.

He is contradicted by Sidney S. Reed (D. S.-reb., 476), who testifies that Joseph Ditlow boarded with him at Wheeler, Indiana, from the 17th of May until some time in June, 1870, which date he fixes by book entries, and that at that time Ditlow told him about Drawbaugh's talking machine.

Reed is the station agent at Wheeler, on the Pittsburg, Fort Wayne and Chicago railroad, and produces the freight receipt book kept by him at that station, upon which appear two entries of freight received for Joseph Ditlow, the first being dated September 25, 1874, and the second March 30, 1877.

It appears further that in both cases the boxes were billed to Wheeler from Pittsburg, and that in addition to the freight from Pittsburg to Wheeler there were charges showing that they had come from a point beyond Pittsburg.

He recollects that the goods received September 25, 1874, were contained in a box, and that Ditlow told him at the time that the box contained steel traps, with which he and a man who worked for Porter Congdon were going off up the Kankakee river to trap that winter.

S. G. Geib (D. S.-reb. 1134), station agent at Marysville, Perry County, Pa., produces the record of freight forwarded by the Pennsylvania railroad from that station, upon which appear two entries of goods consigned to Joseph Ditlow, billed to Pittsburgh transfer, aud marked for Wheeler, Porter County, Indiana. The date of the first being September 19, 1874, and of the second March 30, 1877.

Mrs. Isabella Hardesty (D. S.-reb. 483) testifies that Joseph Ditlow commenced to work for her husband, Harmon Hardesty, at Wheeler, Porter County, Ind., in the spring of 1874; that he and Cyrus Kissinger, who then lived with Porter Congdon, went trapping in the fall of that year; that previous to starting on said expedition, Ditlow had been for some time expecting his trapping kit from Pennsylvania, and was particularly anxious about a stove which belonged to it, and which he told her he wanted, because Mr. Drawbaugh made it for him; and that he at the same time told her that Mr. Drawbaugh was an ingenious man who had been making a talking machine, as he called it, and that he (Drawbaugh) had a talking machine to talk through the house.

She remembers that the kit arrived afterwards, and that it was sent to him a second time in 1877, but that the conversation about the talking machine occurred whilst he was expecting it the first time—in 1874.

3. Saloma Hardesty (*Id.* 489), the daughter of Harmon Hardesty, testifies that she remembers of Joseph Ditlow going trapping with Cyrus Kissinger in the fall of 1874; that they used a trapping kit belonging to Joseph Ditlow, which he had received from the East a short time before; that the kit was packed in a chest when it came, and was brought to her father's house, and there opened;

that at the time it was opened Ditlow told those who were present, among whom she was, about Mr. Drawbaugh "making his stove for him, and about him inventing a talking machine," which he told them was in Drawbaugh's shop, and was so arranged that he could talk upstairs with it.

She further testifies that Ditlow mentioned Drawbaugh's talking machine on more than one occasion.

4. Harmon Hardesty (*Id.* 493) testifies that Joseph Ditlow began to work for him in the latter part of May, 1874, and worked five summer seasons successively; that in the fall of 1874 Ditlow received, by the Pennsylvania railroad, a pine box or chest, containing traps and trapping utensils; that he (Hardesty) brought the box from the railroad station at Wheeler to his house; that whilst they were opening the box and unpacking it, Ditlow told him about Mr. Drawbaugh. "He said he was a very ingenious man; he told about fixing up the stove for him; he said he had made a talking machine, by which he could talk through his buildings;" that Ditlow further told him that he himself had seen it, and that he described it as an old tumbler at one end and an oyster can at the other end, which were connected with wire.

He further testifies that he (witness) took Cyrus Kissinger and Joseph Ditlow, having with them Ditlow's trapping kit, to Crooked Creek, which empties into the Kankakee River, for the purpose of trapping; that when that expedition was over, the trapping kit was brought back to his house, and that he (witness) shipped it back to Pennsylvania in the latter part of September, 1875; that it came out to Indiana again in the spring of 1877; and that Ditlow spoke about Drawbaugh's talking machine again, about a week or ten days after his box was opened.

He further testifies that he was taken to Philadelphia, in April, 1883, before complainants had closed their testimony, as a witness for the Bell Telephone Company in this suit by a man named Tompkins, an agent of complainants; that he was taken to the Hotel Lafayette, Philadelphia, and was asked to sign a statement which was written by complainants' counsel, and that he signed it; that he and Tompkins had quite a talk about the arrival of the kit, and as to the dates, as Tompkins informed him that it arrived in 1877, and that he, witness, was not "in shape to know any different at that time without reference to earlier dates at home;" that he was thus induced to say, in said written statement, that Joseph Ditlow spoke to him about Drawbaugh's talking machine for the first time in the spring of 1877; that immediately after the statement was signed—the same evening—he told Tompkins that he didn't think he was right, whereupon Tompkins showed him a memorandum, which set forth the date of the arrival of the kit at Wheeler as in 1877, and which he (Tompkins) claimed to have made from a railroad receipt; that he (witness) still expressed his doubt with regard to the date, and upon his return home to Indiana he looked up the matter, and discovered that the kit had arrived at Wheeler September 25, 1874, and was then satisfied that that was the time when Joseph Ditlow first told him about Drawbaugh's talking machine.

5. Hamlin Hardesty (*Id.*, 509), a son of Harmon Hardesty, testifies that he was present when Joseph Ditlow's trapping kit arrived and was unpacked at his father's house in the fall of 1874; at the time Ditlow stated that Mr. Drawbaugh was the man who made the stove for him, that he was an ingenious man and had invented a talking machine; that Ditlow said "he had seen it in the shop, and it talked up-stairs to a man." He testifies that the kit arrived at Wheeler twice, the second time in 1877, but that the conversation about the talking machine took place at the time of its first arrival.

6. Joseph Ditlow, himself, is recalled (*Id.*, 521) and testifies that after having had nearly a year's time for reflection on the subject, and for refreshing his memory, he still believes that he first heard of Daniel Drawbaugh's talking machine in the Milltown store from George Drawbaugh; that he can't fix the date when he first heard of it, but is satisfied that the date given in his former deposition—between the fall of 1876 and spring of 1877—when Jeremiah Fry kept the store—was not correct, and that he heard of it and saw it before that time.

He testifies that he has no recollection of having told Reed about Drawbaugh's talking machine in the summer of 1870, but that he boarded with Mr Reed at that time, and, from his knowledge of Mr. Reed as a man, he is satisfied that his (Reed's) statement is correct; that he is also satisfied that the testimony of the Hardestys to the fact that he told them about Drawbaugh's talking machine in the fall of 1874, at Wheeler, Indiana, is correct.

He further testifies that the first persons who came to see him in Indiana on behalf of the Bell Telephone Company were Mr. Comfort and Mr. Storrow; that they exhibited to himself and his brother Abraham some talking machines, and that his brother Abraham pointed out a machine or machines which he had seen before, or which was familiar to him, whereupon "Mr. Comfort said that he (Abraham) never saw that at that time at Drawbaugh's shop;" that whilst at Philadelphia, Comfort prepared a written memorandum of dates, which he gave to witness, and told him to read it over, and study it so that he would have it by heart.

Jacob Evans (C. Vol. 1, 974) testifies that he was married to Mary A. Ditlow in September, 1874; that in November, 1874, he began to work at milling at Etter and Shanklin's Mill [about one-fourth of a mile below Milltown on the Yellow Breeches Creek], and worked there until some time in September, 1875, when he quit and moved to Milltown, working back and forward for Cyrus Bowman at George Leonard's grist mill until the 1st of March, 1876, when he took charge of said mill as head miller for Dellinger and May, who at that time purchased it from George Leonard. He continued to live at Milltown until the spring of 1881, when he moved to Fishing Creek Valley, York County; that when he first moved to Milltown, in September, 1875, he moved into a house owned by George Leonard, opposite the house then occupied by Daniel Drawbaugh and now occupied by Daniel Fettrow, remaining in it until the following spring (1876), when he moved into a house owned by Dellinger and May, and remained in it until July, 1876; that he then moved into another house owned by George Leonard, and there remained until the spring of 1878, when he moved into the house in front of the mill which had just been vacated by Daniel Drawbaugh, and there remained until the spring of 1879, and thence moved into another house owned by George Leonard, remaining there until some time in 1880, when he returned to the house in front of the mill, and remained there until he left Militown.

Counsel for complainants took especial pains to bring out from the witness the fact that the George Leonard house, in which he lived from September, 1875, until the spring of 1876, was not the same Leonard house in which he subsequently lived.

Witness testifies that, whilst residing at Milltown, he went down to Drawbaugh's shop, and that Drawbaugh showed him there some of his inventions, among other things his electric clock, telegraph instrument, magnets and machine for wrapping wire, and hydraulic rams; that Drawbaugh told him about his machine for making paper bags; that he could not remember that he had ever seen any talking machines at Drawbaugh's shop; that he did not think that if he had seen any he could have forgotten the fact.

Upon being shown Exhibits "A" to "Q," inclusive, exhibit "I," he testifies that he cannot remember of seeing anything like them in the shop, and, further, that he does not remember ever having heard Drawbaugh say anything about talking machines; that his first knowledge of Drawbaugh's talking machine was some time in 1877, when he heard different persons talk about it; that the first time he ever saw anything connected with Drawbaugh's talking machine was just before Christmas, 1877, when he saw a wire run from the shop across to the hill opposite.

Upon cross-examination he reiterates his denial of any knowledge of Drawbaugh's talking machine prior to 1877.

In contradiction of his testimony defendants called a large number of witnesses, to wit:

First. His brother, Andrew Evans (D. S.-reb., p. 1), who testifies that he began to work for Ambrose Knaub, in Dillsburg, York County, Pa., on the 8th of November, 1875, and worked for him one month; that during that time he (Evans) owned a horse and buggy, which he kept at Ambrose Knaub's, and which Knaub borrowed to attend the funeral of his landlord, Jacob Hurst, at Mechanicsburg, Pa.; that on a Saturday, toward the latter part of the time he lived with Knaub, either in the last of November or the beginning of December, 1875, he drove the said horse and buggy down to Eberly's

Mills, taking his two sisters, Sarah E. Evans and Margaret Jane Evans (now Mrs. Margaret J. Erb), to visit their brother, Jacob Evans; that they remained at their brother's until afternoon of the next day (Sunday), when they returned home; that whilst there he visited Daniel Drawbaugh's shop on Sunday in company with his two sisters and his brother Jacob and the wife of the latter; that Daniel Drawbaugh then and there exhibited to them his talking machines, his brother, Jacob Evans, being present.

Witness identifies "B," "C," "D" and "E," and testifies that Drawbaugh went into another room and talked through his machines, whilst Jacob Evans listened; that Drawbaugh explained his talking machine to them, telling them "it was worked by electricity," and that he could "take this machine and talk clean out to Europe across the ocean;" that he "seemed enthusiastic about his talking machine invention;" and that upon their return to Dillsburg he spoke to others about the talking machine he had seen at Drawbaugh's shop.

He further testifies that at the time of that visit his brother Jacob lived in a house (which is now torn down) in the upper end of the town, not far from the blacksmith shop, and on the opposite side of the road from it; that he never again visited his brother Jacob in compony with his two sisters, and never was again in Drawbaugh's shop, so far as he can remember, except in 1879, when his wife was with him, and he did not see the talking-machines, and had no conversation with Drawbaugh.

He mentions, among other things which he saw at Drawbaugh's shop when he and his sisters and brother Jacob were there, patent axles.

Second.—Mrs. Margaret Jane Erb (*Id.* 47) testifies that in the fall of 1875, her brother, Andrew Evans, whilst he was living at Ambrose Knaub's, took her sister Sarah and herself on a Saturday to Eberly's mills, to visit their brother Jacob; that they remained there until the next afternoon (Sunday), when they returned home; that on Sunday morning her brother Jacob and his wife, and her brother Andrew, her sister Sarah and herself visited Daniel Drawbaugh's shop; that Drawbaugh then and there showed them talking machines, by which, he said, he could talk across the ocean.

She picks out " D " and " E," and testifies that she does not remember rightly which one of the two she saw, but thinks it was " E "; that on her return home she told her folks about seeing Mr. Drawbaugh's talking machine, and about his saying he could talk across the ocean.

She further testifies that her brother Jacob at the time of the visit was living in a white-plastered house, which is not now standing, but which was then up alongside of the hill; that she never visited her brother Jacob in company with her brother Andrew at any other time, nor was she ever at any other time at Drawbaugh's shop.

Third.—Sarah Elizabeth Evans (*Id.* 55) testifies that her brother Andrew took her and her sister Jane (now Mrs. Erb), with his horse and buggy to Milltown, to visit their brother Jacob, in the latter part of November, 1875; that Andrew was at the time living at Ambrose Knaub's; that they left home on Saturday and returned on Sunday; that whilst at Milltown they visited Drawbaugh's shop in company with their brother Jacob and his wife, and then and there saw Drawbaugh's telephone.

She identifies " A " and " D," which she says she is sure she saw, and thinks she saw " B," " C," " E," " F " and " I," but is not positive; she says she saw a number of instruments there, but couldn't remember them all.

She remembers that Drawbaugh talked through the machines, and that her brother Jacob listened; and further, that Drawbaugh said " he could talk across the ocean if he could get his wires fixed across the ocean." She further testifies that she never was at Drawbaugh's shop at any other time, and that on her return home she told the folks there what she had seen in Drawbaugh's shop.

Upon being recalled for further cross-examination by complainants with regard to the state of the weather at the time of the visit to her brother Jacob, she testifies that it was pretty cold on Sunday evening, but was neither snowing nor raining; " it was cloudy, but it didn't give no falling weather."

Fourth.—Ambrose Knaub (*Id.* 38) testifies that Andrew Evans was in his employ about a month, beginning early in November, 1875; that he [Evans] had at that time a horse and buggy, which he kept at his [Knaub's] place;

that during that month Knaub borrowed said buggy to attend the funeral of his landlord, Jacob B. Hurst, who died at Mechanicsburg. (November, 18, 1875, buried November 20, 1875. Hurst, *Id.* p. 75.)

He further testifies that, whilst living with him, Andrew Evans took said horse and buggy and drove, accompanied by two of his sisters, down to somewhere near New Cumberland, to visit his brother Jacob; that Andrew Evans was gone from Saturday dinner until Sunday evening; that upon his return, he [Evans] told him [Knaub], that he and his brother had been to the shop of Mr. Drawbaugh, and had seen a talking machine which Mr. Drawbaugh had invented, and had heard him talk through it.

He is corroborated by his wife, Eliza Knaub (*Id.* 42), who remembers of using Andrew Evans' buggy, whilst he lived with them, to attend the funeral of their landlord, Mr. Hurst; that Andrew Evans lived with them one month, and that, whilst living with them, he made a visit to his brother, Jacob, using said horse and buggy, and taking his sisters with him; that upon his return he (Andrew Evans) talked about something he had seen that was something of a curiosity, but she (witness) did not understand about it, and does not remember what it was.

Fifth.—David Evans (*Id.* 86) testifies that he remembers of the visit of his brother Andrew, and his two sisters, Sarah Elizabeth and Margaret Jane, to his brother Jacob, at Milltown, in the fall of 1875; that they went on Saturday and returned on Sunday; that he had a talk with his two sisters on Sunday evening when they came home; that they told him they had visited Drawbaugh's shop at Milltown, and had seen a talking machine; that Mr. Drawbaugh had told them that "if he had wires to it he could talk across the ocean into Europe."

Sixth.—Mrs. Elizabeth Evans (*Id.* 75) testifies that she is the aunt by marriage of Jacob, Andrew, Sarah and Jane Evans; that she has lived for seventeen years with her father, Moses Evans; that she remembers the fact of the last-named three making a visit with their brother Jacob at Milltown while Andrew was living with Ambrose Knaub; that they started from home on Saturday afternoon, and returned Sunday evening; that on Sunday evening or Monday after their return, the Evans girls told her that they had been at Drawbaugh's shop with their brother Jacob and his wife; that they had seen great curiosities there, among other things a talking machine that Drawbaugh said "he could talk across the ocean with, away into Europe," and that he did talk through it whilst they were there; that their brother Jacob Evans was present when they saw the talking machine.

Seventh.—Moses Evans (*Id.* 78) the father of Jacob and Andrew Evans, testifies that his son Andrew went to work for Ambrose Knaub about the beginning of November, 1875, and worked for him about a month within a day or two; that whilst employed there Andrew with his two sisters, Jane and Sarah, made a visit to their brother Jacob at Milltown, some time in the latter part of November or beginning of December, 1875; that they left home on Saturday and returned on Sunday evening; that upon that evening after their return, the girls told him that whilst at Milltown they had seen Drawbaugh's talking machine, and that Drawbaugh had told them he could talk across the ocean.

Eighth.—Mrs. Elmira Rentzel (*Id.* 83), a sister of Jacob Evans, testifies that in the fall of 1875 she was living at Joseph Best's; that she knew of her brother Andrew living with Ambrose Knaub in the fall of that year; that she was at her father's house about a week after Andrew, Sarah and Jane had made their visit to Milltown, which her sisters told her of; that they told her their brother Jacob had taken them to Mr. Drawbaugh's shop, and that "they had seen a talking machine there; that Mr. Drawbaugh could talk across the ocean;" that she herself visited her brother Jacob at Milltown in February of 1876, when the visit of Andrew, Sarah and Jane was spoken of in his family, and that Jacob then told her about Mr. Drawbaugh's talking machine, and said he would take her to see it, but something happened to prevent his doing so.

Ninth.—Mrs. Mary A. Evans (*Id.* 61), the wife of Jacob Evans, testifies that she heard about Drawbaugh's talking machine before the death of her father, which happened February 21, 1873, and long before her marriage (September 12, 1874); that she moved with her husband to Milltown in the fall of 1875, into a rough-plastered house—which has been torn down now—on the right-hand side as you go up the hill, nearly opposite the blacksmith shop; that they lived there from the fall of 1875 to the 2d of April, 1876, when they moved away, and never lived in that house afterward; that she remembers the visit of Andrew Evans and his two sisters, which happened some time between October and December, 1875, whilst she lived in the aforesaid house; that they came on Saturday and stayed until Sunday afternoon; that on Sunday she and her husband, Jacob Evans, took them down to Drawbaugh's shop, and that Drawbaugh then and there showed them his talking machine—his telephones—and other inventions. She identifies "A," "B" and "D" as instruments which she saw at that time. She remembers her husband and Mr. Drawbaugh talked through the telephone, and that her husband listened.

She testifies further that Drawbaugh told them how many miles he could talk through his telephone; the number, however, she does not remember—"it was a great way, though; he was certain of that; so many miles as he told us;" and that he further said, "if he could get the wires fixed across the ocean, he could talk clear to Europe."

She further testifies that upon her husband's return from Philadelphia, immediately after giving his deposition on behalf of complainants, he told her what he had testified to, and that she thereupon told him it was impossible; that he couldn't remember, and called his attention to the visit of his brother Andrew and two sisters, whereupon he expressed himself as having recollection of the fact himself.

Jacob Evans himself, being recalled (*Id.*, 88), testifies that after the 1st of April, 1876, he never lived in the house opposite Daniel Fettrow's, into which he moved when he first moved to Milltown in September, 1875; that whilst he was living in that house his brother Andrew and sisters Sarah and Jane visited him together; that that visit took place the latter part of November or beginning of December, 1875; that they came to his place on Saturday evening, and went away on Sunday evening or Sunday afternoon some time; that during that visit he remembers of going with them and his wife to Drawbaugh's shop; that Daniel Drawbaugh then and there showed them them his talking machine; that he also talked through it, and thinks that he (witness) listened; and, further, that Drawbaugh then and there said, "that he could use that machine, or talk with that machine across the ocean into Europe; that is, in case he could have the wires stretched up in operation—to a man, the same as him and I was talking there, face to face;" that when he testified for complainants at Philadelphia these facts had slipped his memory; that immediately after his return from Philadelphia his memory was refreshed by a conversation between his wife and himself, in which he told her what he had testified to at Philadelphia, and she called his attention to the visit of his brother and sisters; and that upon his memory being so refreshed, he "well remembered" it, and the fact that he went with them down to Drawbaugh's shop and saw talking machines.

He further states, that with his memory now refreshed, he is able to recollect that he heard of Drawbaugh's talking machine before he moved to Milltown, and he admits that he may have heard of it before he went to work at Etter and Shanklin's mill in 1874.

Tenth.—He is further contradicted by John Simmons (*Id.*, 427), who testifies that in November, 1875, he and Jacob Evans went together to Drawbaugh's shop; that Drawbaugh then and there showed them his talking machine, and talked through it to them; that both of them listened, and laughed whilst Drawbaugh was talking through the machine. He further positively identifies "A" and "E" as two machines which he then and there saw, and says he may have seen "B," "C," "D," "F" and "I."

A feeble and ineffectual attempt was made by the complainants in rejoinder to weaken the force of the Evans testimony by showing, 1st, that Jacob Evans, in the summer of 1883, denied all knowledge of Drawbaugh's talking machine; and, 2d, that Sarah Evans was mistaken with regard to the state of the weather on the day when she visited Drawbaugh's shop in company with her brothers and sisters.

These matters have been discussed in the main brief, and need not be further alluded to here.

Amos Frownfelter (C. Vol. 2, 1225) testifies that he lived at Eberly's Mills from April, 1871, to April, 1874, when he moved to the farm of J. K. Heck, about four miles from Milltown; that whilst living at Milltown he did a great deal of grinding of tools, such as axes, scythes, etc., belonging to the farm on which he lived, at Drawbaugh's shop; that Drawbaugh never showed him any talking machines, and never, before this controversy began, told him that he had any talking machine at the shop, and that he never heard of Drawbaugh's talking machine prior to the spring of 1878, although he was accustomed to go to the store at Eberly's Mills on Saturday evenings, and sometimes through the week.

He does not, however, mention anything that he saw at Drawbaugh's shop.

He is contradicted by:

Augustus Kahney (D. S.-reb., 254), who testifies that he was at Drawbaugh's shop on one occasion when Amos Frownfelter and his mother were there; that he saw them going out of one of the rooms on the second story of the shop, which he entered immediately after; that he then and there saw on a bench or table in that room some of Drawbaugh's talking machines lying in open sight, so that anybody who might happen to be in the room could see them.

He further testifies that Amos Frownfelter's mother was killed by being thrown from a carriage in 1877.

Whether Frownfelter failed to see the talking machines which were lying in open sight, or having seen them, failed to remember that fact, the worthlessness of the negative testimony such as complainants have mainly relied upon is equally well illustrated.

Wm. C. Frownfelter (C. Vol. 2, 1229) testifies that he lived with his father at Eberly's Mills from the spring of 1871 to the spring of 1874; that during that time he was in Daniel Drawbaugh's shop several times—he can't tell how often; on being pressed by complainants' counsel he said he supposed, on an average, once a week; that he was all through the shop; had been in Drawbaugh's private room, and Drawbaugh showed him different inventions of his, but never showed him a talking machine.

He further testified that whilst he lived in Milltown he never heard Mr. Drawbaugh, or any one else, say that Mr. Drawbaugh had a talking machine or was at work on one.

On cross-examination he testified that he first heard of Daniel Drawbaugh's talking machine in the fall of 1879; and further, that he never was in Drawbaugh's shop from April 1, 1873, to April 1, 1877, and never saw any talking machine between those two dates.

He further testified that he knew a man named George H. Rupley, with whom he became acquainted soon after April 1, 1874, and that he had never told Rupley anything about Drawbaugh's talking machine, and had never told him that he had seen it strung on the fence and had heard somebody talk.

When questioned with regard to the machines he had seen at Drawbaugh's shop, he was able to remember nothing but rams, molasses faucets, weather gauges, and an old Dutch clock, which was apparently the skeleton works of Drawbaugh's original magnetic clock.

It must be noted, however, that witness was very young at the time. He moved away from Milltown when fifteen or sixteen years old.

George S. Rupley, being called by defendants (D. S.-reb., 659), testifies that he had a conversation with William Frownfelter with regard to Daniel Drawbaugh's talking machine, in which Frownfelter told him that Daniel Drawbaugh had a wire strung along a fence above his shop, used for the purpose of speaking or transmitting speech, and that this conversation took place some time between April 1, 1874, and April 1, 1877.

Theodore Grissinger (C. Vol. 1, 511) testifies that J. E. Shettel, Jacob H. Grissinger, Daniel Drawbaugh and himself composed the partnership which was started in the spring of 1878, for the purpose of patenting and building Drawbaugh's magnetic clocks; that he had a conversation with Drawbaugh at his shop in the spring or summer of that year, in which the witness in a jesting way asked Drawbaugh why he had not invented the telephone, that it would have paid better than electric clocks, to which Drawbaugh replied that he had done something in that way; that thereupon witness, for the purpose of ascertaining what claim Drawbaugh had to be the original inventor of the telephone, asked him what he had done, and in reply Drawbaugh told him different things he had done, but could show nothing nor give any dates for what he had done; that the impression left on his mind was that Drawbaugh had not done enough far enough back to entitle him to claim the invention, and he was entirely satisfied from what Drawbaugh told him, that he had no claim; that whilst witness was connected with the clock company he was in the habit of going to the shop frequently; that he never talked through a speaking telephone there, or heard anybody talk through one; that during the latter part of the operations of the clock company, Drawbaugh told him there was a pair of telephones connected at the shop, but witness did not speak through them, neither did he examine them.

He identifies Exhibits "D" and "E," and testifies that he saw the former at Drawbaugh's shop, and the latter, or one like it, at his (witness') office at Mechanicsburg.

He denies ever having seen Exhibits "H," "J," or "P," and says that he does not think Drawbaugh ever showed him any of his telephones prior to the conversation above related.

He further testifies that Drawbaugh told him that he had a line from his shop to his dwelling-house, over which he had tried to transmit speech, and could, by speaking very loud, hear a noise, but could not understand; that Drawbaugh said *this was one of his first experiments.*

On his cross-examination he testifies that Drawbaugh told him that he had talked through his telephone, but could not understand, but that he never told him that he had talked through them and had been understood.

The witness, however, does not pretend to give the exact words used by Drawbaugh, but only the impression he received at the time. He further testifies that he asked Mr. Drawbaugh, in the conversation referred to, whether he had any telephone instruments at that time, and Drawbaugh said he did not have any. Witness says this inquiry related to Drawbaugh's old machines that he made in his earlier experiments.
